In brazing it is absolutely essential that the surfaces to be united are clean and free from oxide, finger marks and all other matter except the proper flux to prevent oxidization of the surfaces when heated. Parts to be brazed should be fitted together closely as melted brass has great penetrating qualities.

A good indication of a sound joint is that, when the spelter is melted, the greater part of it appears to have penetrated the joint. Another test is to watch the brazing carefully as it cools

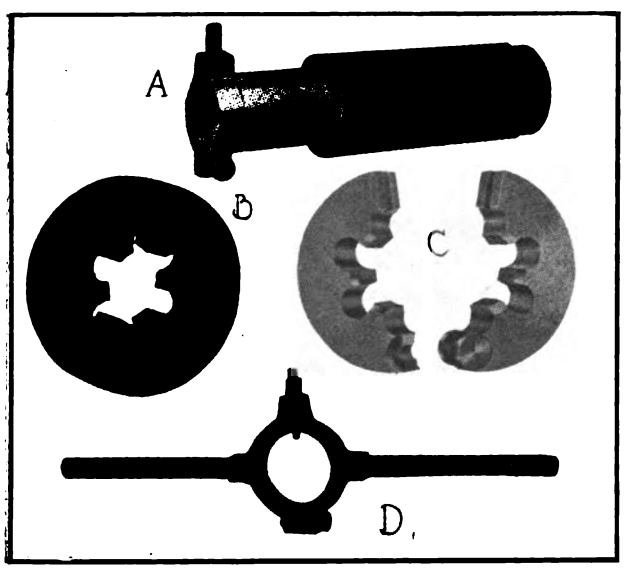

Fig. 4—Useful Tools for the Shop Equipment: A, Remington Screw Holder Adapted to Lathe Work; B, Adjustable Screw Cutting Die; C, Showing Assembly of Member; D, Elastic Die Holder.

after it is judged to be completed and is removed from the fire. Where the two parts join they should be the same degree of redness, and if one begins to turn black before the other, it is a sign that the joint is not sound, because if the spelter had melted and united properly with the parts, it would have conveyed the heat from one to the other so that they would have cooled together.

It should be remembered that the work to be brazed should not be exposed to heat before it has been covered with borax or some similar flux so as to prevent oxidization. This is why it is recommended that those not familiar with brazing have a supply of borax without spelter to apply to the work in the preliminary stage of heating, otherwise a quantity of partly fused spelter is apt to collect on the work, and this is somewhat troublesome to remove.

Removing Surplus Spelter.

When a piece of work has been brazed, it is best to let it get cold and not attempt to remove the superfluous spelter while it is hot, as by so doing an inexperienced workman may disturb and spoil what otherwise would be a sound joint.

Copper and brass require more care in brazing than iron or steel, as the melting points of the two former metals are not far from that of the spelter. In the case of cast brass, which is perhaps one of the most difficult substances to braze, owing to its low melting point, care should be taken to use a suitable spelter, one that runs easily.

ADJUSTABLE DIES AND HOLDERS.

Screw cutting dies form a valuable addition to the equipment of the repair shop and modern shop practise demands of all tools that they do their work quickly and well, that their form be such that they can be sharpened easily and that they cut as true at the end of a year's use as at its beginning.

The Remington Tool & Machine Company, Boston, is manufacturing a screw cutting die which is adjustable and possesses the quality of being easily accessible for sharpening or repair. The tool, which is shown at Fig. 4B, is constructed in two parts with a heavy rigid hinge formed integral with one side.

It is claimed by the maker that the die may be resharpened so long as any appreciable portion of the teeth remains, and that its life is from five to 10 times that of ordinary members. The taper hole at the top provides for the reception of the tapered point of the adjusting screw on the elastic die holder shown at D. Adjustment for expanding or contracting the die is accomplished without its removal from the holder. It is also pointed out that the hinge and taper point practically make a solid die when placed in the holder.

The die is ground to a perfect cutting edge after tempering and is so designed that there is ample clearance for an emery wheel or lapping with diamond powder. It is also stated that particles of metal lodging between the teeth of the die are removed easily and that alignment is secured by reason of the sharp cutting teeth. The screw lead is properly maintained and a single cut is stated to make a perfect thread.

For bench work the die is utilized with the

Digitized by Google

elastic or ordinary holders, but for machine work the member shown at A is recommended by the maker. The dies are constructed to cut U. S., V, Whitworth or Acme standard thread. They are made in diameters varying from .25 to four inches, and pitches from 20 to four, according to the style of thread. The best of material and workmanship are incorporated. Edgar T. Ward & Sons, Boston, is selling agent.

WAYNE SIDEWALK FUEL PUMP.

Proprietors of some garages complain that there is no money in selling gasoline, stating that the profits are consumed by the cost of service and shrinkage. This does not apply to the concerns which are equipped with modern appliances. The small garage that makes it a practise to draw five gallons at a time from a tank and carry it as well as the funnel to the car, is losing the services of an employee. With the modern facilities for handling gasoline there is no reason why good money should not be made by selling fuel.

Considerable improvement is noted in labor as well as time saving appliances for handling gasoline, and at Fig. 3 is shown the Wayne sidewalk pump, manufactured by the Wayne Oil Tank & Pump Company, Fort Wayne, Ind. It will appeal to the retailer in that it may be installed at the edge of the sidewalk, as well as in the garage, and in addition to being a practical equipment presents an attractive appearance to the passing motorist. Among its qualities is that its components are completely enclosed and locked by a spring lock, preventing its use by persons not possessing a key. This enables the owner of the garage to keep an accurate record of all gasoline sold or utilized.

The pump consists of a substantially made cabinet of cast iron finished in red enamel and black trimmings. The pedestal is fastened to the sidewalk by four expansion bolts inside the base. The cabinet is 4.5 feet high, overall dimensions, and occupies a ground space of about 18 inches square. Doors are provided on either side. The handle for pumping is located on one side and the hose and portable nozzle on the other. The pump is a specially designed one-gallon measuring member and is adjustable to measure a half-gallon or a quart at one stroke. The measuring device is enclosed in the housing at the top and cannot be tampered with. The pump is equipped with a 10-gallon discharge register and a 10,000-gallon worm gear meter which registers a cumulative record of all fuel drawn. There is also a dial to measure the fuel by quarts, if desired.

The outfit is equipped with a seven-foot length of special gasoline hose and a portable filling nozzle. When desired the pump may also be equipped with a special filter for removing water. The equipment may be utilized with any sized tank and may be employed with another pump located inside the garage. Economy of time is effected as the automobile is stopped beside the pump and the nozzle inserted in the tank. It also saves registering the car upon the garage record, which is required in some states.

SUBSTITUTE FOR LEATHER.

According to Consul-General John L. Griffiths, London, England, a new material, Seagumite, has been discovered which may be employed as a substitute for rubber and leather belting. It is obtained by treating seaweed by a secret process which, it is stated, results in a totally non-inflammable, impervious, leather like, damp proof composition, unaffected by heat, cold, oils or exposure to the weather.

Its inventor expects it to be used as a substitute for rubber and leather in all climates, and its cost of production is very low. It possesses an unusual power of resistance to an electric current and trials made under severe conditions by electrical experts show that it withstood a test of 32,000 volts and that its insulating properties are greatly enhanced after immersion in water.

It is claimed by the inventor that carriage and motor tires can be manufactured with the new material at one-third the cost of rubber shoes. Seagumite may be used for steam packing and is held to be considerably cheaper than leather. It is said to possess great tensile strength and is non-slipping, a factor favoring its use for belting. It also has acid resisting qualities. It is proposed to erect a factory to manufacture the material on a commercial scale.

SHOW FOR RICHMOND, VA.

Chester I. Campbell, who is well known in the industry through his successful management of the Boston automobile show, and other exhibitions of a like character in that city, for a number of years, has been engaged by the Richmond Automobile Dealers' Association as manager of the display which that organization will hold in Richmond, Va., Feb. 15-22. Full details of the arrangements will be announced by the association in the near future.

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

Emblem in Strenuous Test.

An accompanying illustration shows Max Burke of Detroit on the Emblem, made by the Emblem Manufacturing Company, Angola, N. Y., with which he recently completed a 692-mile trip without a single adjustment of machine, carburetor or tires. This trip was made alone and was the result of a joking remark, in which Burke claimed he could cover the distance on his Emblem without using a tool of any sort, or a pump. According to the terms of his agreement he was forced to ride his tires flat, if he should be so unfortunate as to experience a puncture. The following description of the trip is made by Burke himself:

In leaving Detroit, for a distance of 30 miles, the roads were fine. After this I rode over nothing but sand, clay, stones and deep ruts, a distance of 342 miles. Only in the towns were the roads paved. It took me three days, not including evenings, riding until 8 at night, to cover this mileage. The roads in places were so bad that I used my clutch and let the machine pull through alone. There had never been a motorcycle of any kind through this country. These towns were from Pinconing to Standish, my way of riding, a distance of 102.5 miles. I think this was some ride to take alone. I never saw these places in my life, and the only guides I had were the people I met.

Max Burke of Detroit, Mich., on His Touring Emblem.

The hills over Mackinaw division were steeper that any I have ever seen. Some of them, when I got to the top, looked to me, without exaggeration, like a falls, maybe not quite so bad. But the Emblem never refused to do its duty. Riding from Grayling to Standish, a distance of 52 miles, it took me just 5.5 hours. You can see for yourself the condition of these roads. I felt like a Glidden pathfinder when I reached Mackinaw City, Wednesday afternoon at 2. I was given a hearty welcome and while no one knew me I soon got acquainted for just a few hours' stay.

In returning, I took a different road, being longer and I think harder to ride. I thought if my machine made the trip up without any trouble at all, I could go back with less. I could not begin to tell all the road conditions, as it would take a 20-page letter, but I do want to tell about reaching Saginaw turnpike.

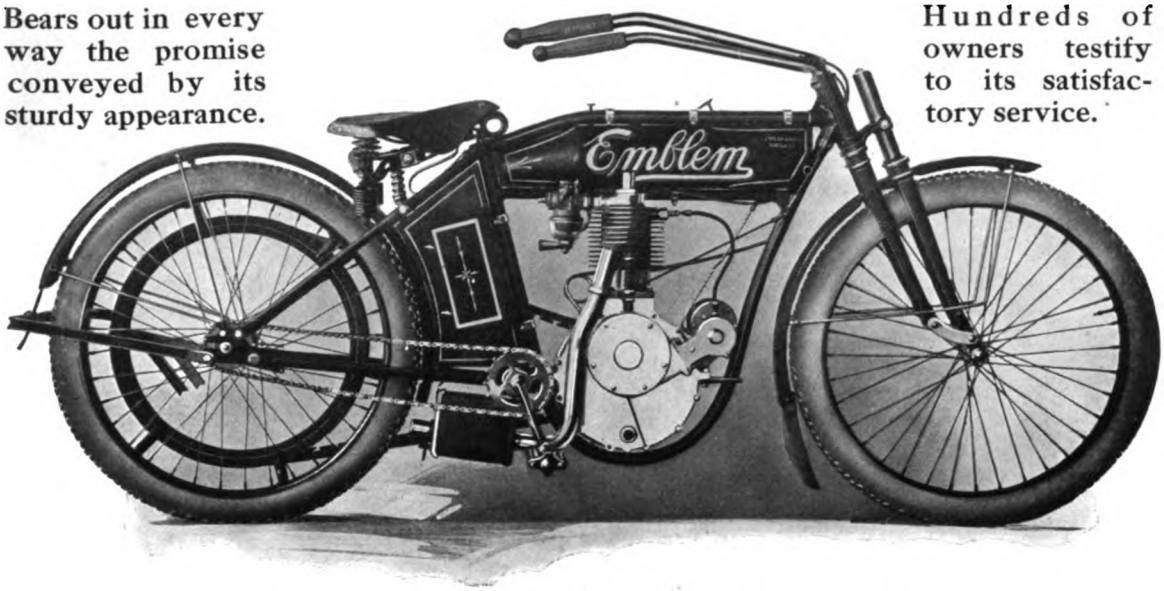
This turnpike, as they call it in Saginaw, is 117 miles from Detroit. I was riding along when I saw about a wagon load of potatoes and apples standing along a fence. Evidently the farmer broke down, as neither he nor the wagon were there. I thought then of a much harder grind for my machine to finish up my trip and to have something to show for, so I took a two-bushel sack of potatoes and strapped it between my seat and the tandem seat, and a bushel of apples, put them into my suitcase, taking what few clothes I had out, sending them by express, and left a note there for the farmer. I told him why I did this, gave him my address and asked him to let me know and I would mail him the charges. I have not heard from him to this date.

I started back with this additional load. I guess by the looks of the people they thought I was out of my mind, undertaking to do this, but it did not bother me. I just wanted to show the people in Detroit that the Emblem was built for power in any way a rider could use it, and it surely did show it.

I reached Detroit safely, my riding time being six days. I used 8.5 gallons of gasoline and five quarts of oil. This may look scarce, but I registered all that I used.

Burke has been riding machines since 1906. He purchased his first Emblem, and the first Emblem in Detroit, from Robert Shattuck, agent for that make in that city. He says he has never ridden a machine that the Emblem Manufacturing Company produced that was not just as advertised, and that a machine of its durability and power always should be upheld by its riders, as it is in Detroit.

Annual Triangle Run.



The Providence Motorcycle Club, Providence, R. I., held its annual triangle run Oct. 6, 42 of the 48 riders covering the 140 miles between Providence, Boston, Worcester and return to Providence. Those who finished with perfect

Lutz failed to finish with perfect marks, but each completed the run in good shape, having a score of 992. A pleasing feature was that not an accident of any kind marred the event.

Touring on Merkels.

William H. Stebbins, of the firm of Stebbins & Geynet, Norwich, Conn., agent for Merkel machines, made by the Miami Cycle & Manufacturing Company, Middletown, O., recently completed a cross country trip from his home city to the Merkel plant, accompanied by a number of other New England riders on six horsepower Merkels. The way led through Hartford, Springfield, Pittsfield, Albany, Utica, Syracuse, Auburn, Buffalo and Dayton.

That portion of the trip through the Berkshires was made without mishap. After leaving Albany the weather became decidedly rainy, frequent halts in wayside barns being necessary. Owing to repairs on the main highway between Fonda and Canajoharie, a detour of nine miles was required, and as luck would have it, a heavy rain had just fallen. After laboring for two hours over a quarter of a mile of tenacious clay mud, they took to the canal tow path, in order to get back onto the main highway, and thereafter they met easy riding into Cleveland.

The journey through Ohio was not so favorable. The equinoctial storm had thoroughly soaked the roads so there was mud everywhere and pools almost up to the engine. Two days

Group of New England Riders on Their Recent Visit Over the Road to Merkel Plant in Middletown, O.

were spent in Galion, the result of an incessant downpour, and they were entertained royally by A. T. Flanery, the Miami company's representative in that city.

The tires held up admirably, only one puncture being reported in the entire party. The Merkel motor also gave complete satisfaction. The party, as shown in an accompanying illustration, was composed of the following: William H. Stebbins, Charles Perry, Jr., Peter Disjardins, W. Earnshaw, Miss Murphy, James Mulholland, Joseph LeBlanc, Howard Gorgen, Edward Johnson, James Murphy, Cecil Peck, William Pickering and James Kirker.

Watch for Stolen Emblem.

The Emblem Manufacturing Company, Angola, N. Y., announces that a red twin Emblem, No. 7335, has been stolen from the freight house at Landisville, N. J. Dealers and repairmen are requested to be on the lookout for this machine.

Ocean-to-Ocean Relay Assured.

President B. J. Patterson of the Federation of American Motorcyclists has received notice from the war department that a message to some officer on the Pacific Coast will be prepared by the department and given in charge of the first relay rider in the coast-to-coast motorcycle relay trip, which will start Oct. 12 at New York. In some communities the riders are already organizing for the relay, while in others they are waiting the announcement of the complete itinerary. One of those who is extremely anxious to ride is Miss Inez Patterson, 16 years old, daughter of President Patterson, heroine of the Kansas Short Grass motorcycle tour of four western states. She is an accomplished rider and will probably take the message over part of Kansas on its way to Los Angeles, Cal.

Suspended Indefinitely.

John H. Gorman, state commissioner of the F. A. M. for the state of Washington, has been indefinitely suspended by Dr. J. P. Thornley, chairman of the competition committee, for officiating at an unsanctioned meet. The following riders of Seattle, Wash., also were suspended indefinitely for participating in the meet: F. W. Mercer, C. T. Hamilton, H. D. Taintor, T. R. White and Fred P. Zwick.

Merkel Factory Addition.

The new factory building, an addition to the plant of the Miami Cycle & Manufacturing Company, Middletown, O., is practically completed and an increased output of the Merkel motorcycles will result. Several radical improvements are said to be embodied in the 1913 Merkel, but as yet they have not been announced.

Indian Southern Branch.

The Hendee Manufacturing Company, Springfield, Mass., maker of Indian motorcycles, has established a factory branch and service depot at Atlanta, Ga., in recognition of the rapid growth of the industry in the South. W. E. Johnston, manager of the company's Denver branch, an old resident of Atlanta, will be in charge. The territory will include North and South Carolina, Georgia, Florida, Alabama, Tennessee and Mississippi.

County Will Purchase Motorcycles.

The board of county commissioners at Savannah, Ga., has opened bids for motorcycles, of which six will be purchased for the new county police force. Four bids were submitted and the purchasing of the machines is considered an important matter by the commissioners.

Long Distance on a Harley.

Walter Oliver of Providence, R. I., recently returned from a cross country trip to Kansas City, Mo., and return, riding his Harley-Davidson mount, made by the Harley-Davidson Motor Company, Milwaukee, Wis. He states that he experienced no trouble whatever, and that the Harley-Davidson is the proper machine to use on a long journey of this nature.

Syracuse Men Are Champions.

George Lockner and William Shields, the Syracuse motorcycle riders, who participated in the 24-hour race at Brighton Beach motordrome, are now considered world's champions by reason of having created a new record. This team was the only one to endure the grind without change. Lockner and Shields led from the start and traversed 1374.2 miles in 22 hours of actual riding, the pilots being given three hours' intermission after the first 12 hours. The previous record was 1093 miles.

LBA Motorcycle Battery.

The development of electric lighting of mechanically propelled road vehicles is not confined to the automobile, as there is a growing tendency to utilize the more progressive system with the two-wheeled mount. In order to meet the peculiar requirements of this service, the Willard Storage Battery Company, Cleveland, O., maker of ignition and storage batteries, has brought out a new type of LBA battery designed especially for motorcycles.

LBA Motorcycle Lighting Battery.

It is very compact, as will be noted by the accompanying illustration, and the dimensions are: Overall height, 7.625 inches; width, 3.5; length, 3.625. It embodies all of the characteristic features of the LBA and is constructed acid tight to withstand the severe service of the motorcycle.

It is designed to be employed with a two-volt lamp and it is stated by the maker that it will give continuous service for from 30 to 35 hours on one charge. Its weight is but eight pounds and it may be attached easily to any convenient place upon the mount.

New McCormick Spark Plug.

The McCormick Manufacturing Company, Dayton, O., is introducing a new spark plug for which several new and distinct features are claimed The plug contains a gas chamber within itself with a tubular opening. Many whirling, hot and penetrating sparks ignite the gas in this

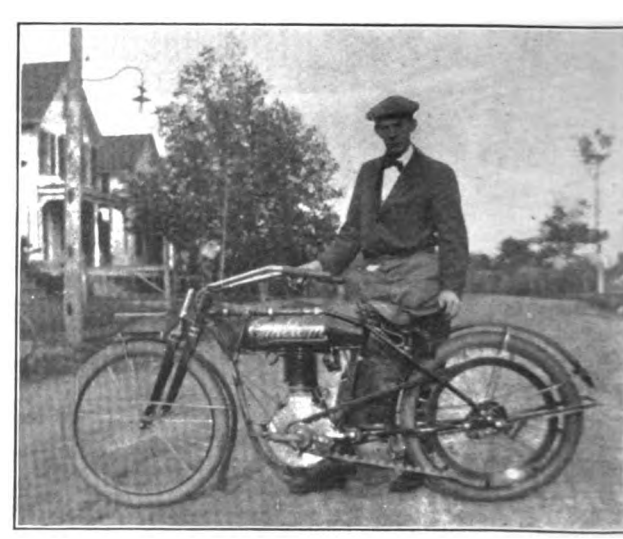
On 10,000-Mile Map Making Tour.

H. A. Stewart, Indianapolis, Ind., recently started on a map-making tour of the United States, which will cover more than 10,000 miles. He is making the journey on a motorcycle in the interests of the Scarborough Company, map maker. On the hourly and daily reports of his Warner autometer will be based facts and figures on the best automobile and motorcycle roads in several states of the Middle West and West.

Ohio Reliability Run.

One of the most important road tests of motorcycles east of the Rocky mountains will be the first annual reliability run from Lake Erie to the Ohio river, under the direction of the Ohio State F. A. M. The route includes 573 miles and will be covered in three days at an average speed of 20 miles an hour. The route will be from Lake Erie, Toledo to Cincinnati, through Mansfield, Cleveland, Zanesville, Columbus, Dayton, Middletown and Clarksville, including Fort Ancient hill.

Worcester Endurance Run.



Concluding a test of remarkable severity, four of the 38 riders who started in the 24-hour endurance run of the Worcester Motorcycle Club, finished at the home control, the other 34 having relinquished the contest at Pittsfield, Mass., when the conditions of travel became difficult owing to heavy rains. The route was from Worcester to Providence, R. I., to Boston and back to Worcester, thence to Albany, N. Y., and return, a distance of about 435 miles. Thirty-two men completed the triangle and started on the trip to Albany. The four who finished were: Watson Walker on a Harley-Davidson and Glen Crandall on a Thor, both of whom had perfect scores. W. F. Mann on a Thor finished with a score of 952, while the fourth member, Gustaf Johnson, on an Indian, had a score of 899.

New Monarch Twin Announced.

The Ives Motorcycle Corporation, Oswego, N. Y., has announced a new twin Monarch for the 1913 line, which will make a fitting companion for its present single. An equipment of new automatic and heavy production machinery, costing $10,000, has been added to the factory.

Emblem Puts Out Twin.

W. G. Schack of the Emblem Manufacturing Company, Angola, N. Y., maker of the Emblem motorcycles, has returned from his trip to the Pacific Coast, where he closed contracts with the same dealers as usual for Emblem motorcycles. While the Emblem company has not made its full announcement of its 1913 line, it is said there will be several radical mechanical improvements. One of the expected additions is a twin, and an important mechanical change will be the substitution of bronze bearings for roller bearings in the engine of this new product.

Jerry Walling, Saddle River, N. J., Agent for Emblem Mounts.

PRODUCTION AND PRICE OF GASOLINE.

BECAUSE of the rapid increase in the price of gasoline since the first of the year, those engaged in the sale and use of both pleasure and commercial automobiles have sought government aid in investigating the matter. The producers claim that there is ample reason for the increased cost, and their position is set forth, in a measure, by the following statement:

In order to understand fully the situation in this regard, it should be understood that a considerable proportion of the oil produced is not suitable for the manufacture of gasoline. The state which produces the largest number of barrels (California), with a total of 81,134,391 barrels, produces only a comparatively small amount of oil suitable for gasoline manufacture, the bulk of this oil being suitable only for fuel, road oil and asphalt production.

Dr. David T. Day of the United States geological survey, in his report on the production of petroleum for 1911, states that while fuel oils increased, refinery oils declined. It is from the refinery oils that the gasoline production is secured.

It should also be noted that gasoline can only be secured to the extent of the small percentage which is found in the oils, and where gasoline is not found in such percentage to pay for refining, the oil cannot be used for this purpose.

The figures given below show that while the general production of oil for 1911 increased over 1910, there is no increase perceptible in 1912 over 1911, and in all cases where increase has occurred the oil has been of such a character as to yield practically no gasoline.

In the meantime the consumption of gasoline has increased yearly between from 65 to 100 per cent. In other words, the oils from which gasoline can be drawn have not increased in quantity and it has been necessary to draw largely upon the accumulated stocks for the supply of gasoline. On account of the increased requirements for refinery oil, the price of crude oil suitable for refining purposes has risen approximately 33.3 per cent. during the last year. Not more than six months' supply of oil is in stock even in California, where much of the oil is not suitable for gasoline manufacture, and in many cases, the supply on hand is much less.

The total production of oil for 1911 (from the report of Dr. Day) was 220,449,391 barrels, and that delivered for all purposes during 1911 was 229,567,581 barrels. While the reports for 1912 are not yet available, the record so far given shows practically no increase over 1911:

December, 1910	93,038,828 bbls.
December, 1911	81,791,433 "
June 30, 1912	76,421,058 "

The production from the fields which supply most of the refining oil stands as follows:

1910	126,255,667 bbls.
1911	127,215,812 "
1912 (6 months)	62,900,069 "

In the meantime the best figures on the automobile business give the following number of cars in service:

	Pleasure Cars	Commercial Vehicles
December, 1910	350,000	No record
December, 1911	550,000	No record
June, 1912	859,000	32,000

The estimated production of the automobile factories for 1912 is 300,000 cars. To this must be added the number of stationary engines, gasoline traction engines, motor boats and yachts, the production of which has increased several hundred per cent. in the last three or four years.

In other words, while the supply of oil has increased slightly, the supply of gasoline has not increased, but the demand is going up by leaps and bounds, and as a consequence the material is increasing in value.

NEW HOFFECKER SPEEDOMETERS.

Announcement is made of two new models of speedometers by the Hoffecker Company, Boston, the new designs being known as models L and M, respectively. The former will appeal to the discriminating motorist as it comprises in addition to a 75-mile speed indicator, a 100,000-mile odometer and a daily trip dial registering tenths. The latter enables the driver to set the device at any point at any time to obtain intermediate mileage, an important factor in touring. The dial is four inches in diameter and above it is an eight-day Waltham timepiece. Both are illuminated at night by a shaded electric bulb.

Model H is a moderate priced speedometer having a three-inch dial and 60-mile speed register. The instrument registers 10,000 miles for the season and 50 miles for trip. The same high grade material and workmanship are incorporated as in the larger model. One of the many qualities of the Hoffecker is that each dial is separately calibrated, insuring accuracy in registering fractions of a mile.

The following concerns have been incorporated recently to manufacture or deal in automobiles, accessories, etc.:

Auto Dispatch Bureau, New York; $25,000; to deal in automobiles; incorporators, Walter Stackhouse, Harold Parker, L. S. Parker.

Knickerbocker Havers Company, New York; $50,000; automobiles, motorcycles and motor vehicles; incorporators, E. M. Cravath, B. M. Crosthwaite, F. E. Grant.

Benton Motor Car Company, Benton, Ill.; $65,000; to manufacture automobiles and accessories; incorporators, H. Stotlar, W. S. Cantrell, A. H. Fraunfelder.

National Auto Top Company, Richmond, Va.; $5000 to $15,000; president, George W. B. Crawford; vice president, E. R. B. Crawford; treasurer, R. V. Merchant.

Mathiesen Spring Cushion Wheel Company, Augusta, Me.; $60,000; to deal in patented automobile wheels and tires; president, R. S. Buzzell; treasurer, L. J. Coleman.

The Ellis Car Company, Greenville, S. C.; $15,000; president, Charles W. Ellis; secretary and treasurer, A. G. Dale.

National Chauffeurs' Association, Portland, Me.: $500,000; to conduct general agency for registration of chauffeurs and motor car drivers; president, Albert F. Jones; treasurer, T. L. Croteau.

Gerhart Spring Tire Company, Marietta, O.; $15,000; to market vehicle wheel tires, wheels, automobiles, etc.; incorporators, J. A. Gerhart, G. O. Salzman, Casper Hopp, S. C. Molder, A. A. Schram.

Havoline Auto Company, Dallas, Tex.: $10,000; incorporators, F. W. White, Edwin Hobby, J. W. Crotty.

Automobile Safety Fender Company, Rochester, N. Y.; $100,000; automobile appliances, etc.; incorporators, William A. Snyder, Jr., Abram De Wolf, Abram Bune.

People's Motor Sales Company, Skaneateles, N. Y.; automobiles and garage; $15,000; incorporators, J. L. Shultz, F. H. Humphries, A. J. Allen.

Economy Tire & Rubber Company, Harrisburg, Penn.; $5000; to make solid and pneumatic automobile tires; incorporators, Edward L. Craft, B. F. Knupp, E. M. Knupp.

Englebert Tyne Company, New York City; $100,000; to manufacture automobiles and motor vehicles; incorporators, Samuel K. Kellock, Clarence B. Campbell, Edward W. Elverson.

Imperial Garage Company, Dover, Del.; $25,000; to deal in and manufacture automobiles, construct and operate garages.

Lewis Automobile Company, St. Louis, Mo.; $16,000; incorporators, J. D. Perry Lewis, Walter H. McLean and others.

The Essenkay Empire Company, Albany, N. Y.; $10,000; to manufacture and deal in automobiles; incorporators, Herman C. Cowen, John G. Cumming, Howard Wilbur.

WITH THE MANUFACTURER.

The Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars, recently gave to the Oakland dealers of the country a dinner at the Pontchartrain hotel, Detroit, known as "The car with a conscience" dinner and a large number of dealers and employees of the concern attended. Previous to the banquet an inspection of the plant was made, the accompanying photograph showing the dealers at the factory. A feature of the dinner was the menu card, in the form of an Oakland radiator. Among those present were: J. W. Martin, Minneapolis; H. L. Hornberger, San Francisco; B. G. Campbell, San Antonio, Tex.; H. L. Leech, Philadelphia; L. F. Smith, Atlanta, Ga.; M. D. Stone, Nashville, Tenn.; J. G. Kreig, Oskaloosa, Ia.; C. L. Barnes, Birmingham, Ala.; H. G. H. I. Bunting, Cedar Rapids, Ia.; Frank Remsen, Atlanta, Ga.; President Thomas Neal, General Motors Company; G. E. Daniels, J. B. Eccleston, F. H. Berger, E. H. Tinsman, J. H. Newmark, T. W. Wilson, L. P. Stone, H. H. Thatcher, H. A. Bauer, J. S. Hull, T. D. Culberhouse, A. N. Greene, H. R. Voit, N. E. Wahlberg, F. O. Ronk, K. B. Alexander.

The Woods Motor Vehicle Company, Chicago, maker of the Woods electric, entered in the parade of old models under the direction of the Chicago Automobile Trade Association, the first electric built by the company. The car is 16 years old and is said to be the oldest electric pleasure vehicle in existence.

The Nyberg Automobile Works, Anderson, Ind., maker of Nyberg cars, has appointed the following agents: Harms and Cragun, Logansport, Ind.; Charles B. Hunter, Jr., Pittsburg, Kan.; D. E. Schwab, Sulphur Springs, Col.; Guild & Hackley, Medarysville, Ind.; A. D. Wright, Kansas City, Mo.

The McVey Manufacturing Company, Dayton, O., maker of the McVey automatic, portable vulcanizer, is making a novel offer to owners and dealers whereby it is possible to secure one of its vulcanizers free of charge.

The K-R-I-T Motor Car Company, Detroit, maker of K-R-I-T cars, has recently closed a contract for 1913 with the Northwestern Automobile Company, Minneapolis, Minn., to handle its line in the northwestern territory. The sales concern is well known to the trade, not only in the Northwest, but throughout the country where it has been identified with the distributing end of the industry since its inception. The accompanying illustration of the showroom shows the modern quarters it possesses for handling its large and growing business.

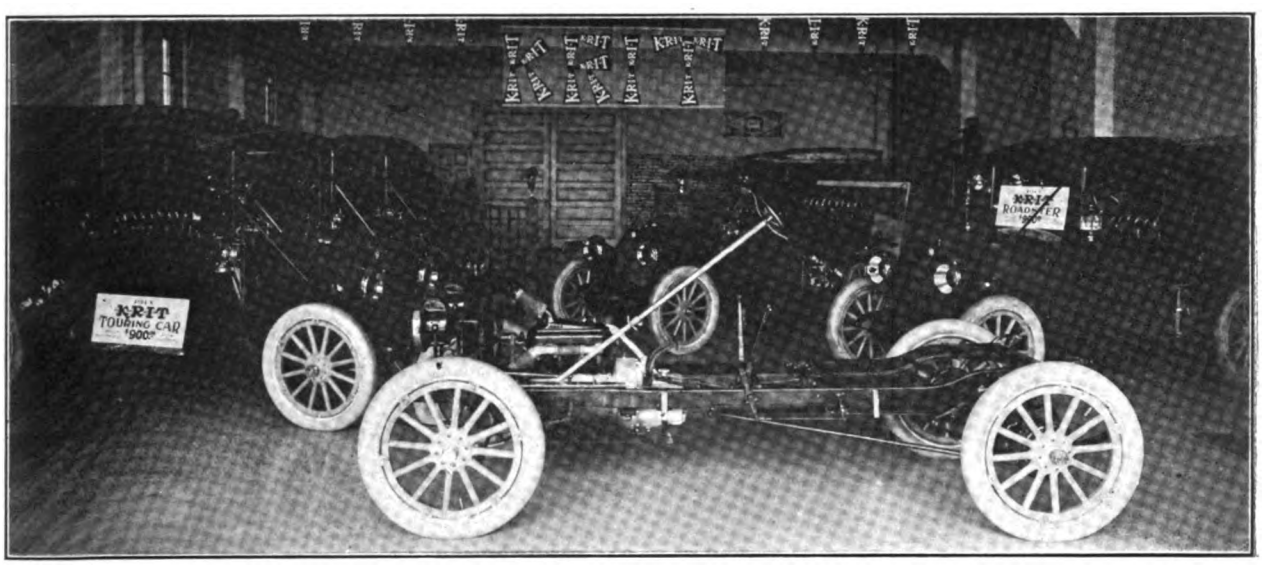
The Chalmers Motor Company, Detroit, has voted to increase the capital stock from $3,000,000 to $5,000,000. Of this amount $1,000,000 was paid in stock dividends to the stockholders and the other $1,000,000 was placed in the treasury for future use.

The Pennsylvania Rubber Company, Jeannette, Penn., manufacturer of the well known vacuum cup automobile tires, has opened a direct factory branch at 149 Berkeley street, Boston, at which place the company will carry a complete line of its tires and products. G. W. Lawrie is in charge.

The Oklahoma Motor Truck Company, Tulsa, Okla., manufacturer of commercial motor trucks, has started a new factory on Boulder street. P. E. Haworth is president of the firm.

The Federal Motor Truck Company, Detroit, maker of Federal trucks, has appointed new agents as follows: Federal Truck Company, St. Louis, Mo.; L. S. Mitchell Auto Company, Chattanooga, Tenn.; Wesley Hill Garage, Phoenix, Ariz.; Vancouver Isle Motor Company, Victoria, Vancouver Isle, B. C.

GARAGE AND DEALER.



Manager C. S. Henshaw, formerly of the Thomas Motor Company of New York, has established temporary quarters in the Automobile building, 1926 Broadway, New York City.

Fred W. Thomas, for many years connected with H. A. Lozier & Co., when that concern was manufacturing Cleveland bicycles and more recently with the E. R. Thomas Motor Car Company, has been appointed special travelling representative of the Lozier Motor Company, Detroit, maker of Lozier cars, in New York and Pennsylvania. Mr. Thomas succeeds W. L. Davis, formerly travelling in the eastern territory for the Lozier company.

J. W. Bowman, Boston distributor of the Stevens-Duryea machines and Waverley electric vehicles, has returned from England on the Franconia after an interesting tour abroad.

The W. E. Allen Company, Milwaukee, Wis., is planning the erection of new salesrooms on Grand avenue, between 27th and 28th streets.

J. P. Winterson, formerly connected with the eastern sales department of the Lozier Motor Company at New York City, has been appointed special travelling representative for that company in the Southwest, having in his territory, Colorado, Kansas, Missouri, Arkansas, Texas, Oklahoma, New Mexico and Louisiana.

Salesrooms of the Northwestern Automobile Company, Minneapolis, Minn., Distributor for the K-R-I-T Line.

J. S. Standlee, Ventura, Cal., formerly head mechanic of the Mission garage, has purchased the plant of the former owner, Bursen & Fowler.

The Tyler Bros. Corporation, a new Boston concern, has opened quarters in Motor Mart, Park Square, in that city and will handle several makes of cars exclusively in New England. Frank J. Tyler is president of the company and L. S. Tyler, who has long been identified with his brother, first with the Maxwell-Briscoe Boston Company and later with the United States Motor Company, is treasurer.

The Martin Sales Company, organized as distributor of Martin shock absorbers, has established agencies at San Diego and San Francisco, Cal., with the home office located at Los Angeles, Cal. A service station and salesrooms have been secured on West Pico street, the latter city, in which are ample facilities to equip automobiles with Martin shock absorbers. The members of the concern are: P. D. Mason, Allan T. Archer, W. L. Graves, Jr., and W. S. Ingram.

The Landman-Griffith Motor Company has been formed at Toledo, O., with a capital of $10,000 and a sales and service building will be erected at 14th street and Madison avenue to cost $25,000. The entire front of the building will be of glass. Charles P. Landman is president and W. E. Griffith is secretary and treasurer.

ENTRIES FOR ROCKINGHAM PARK.

Keen interest is being manifested in the forthcoming race meet at Rockingham Park, Salem, N. H., Oct. 12, in which at least 10 well known racing cars, some of which took part in the events at Milwaukee early in the month, will be seen. The complete entry list is not at hand, but it is announced that the following drivers and cars will take part in the nine automobile events:

Harry F. Grant, Grand Prize Stutz; G. C. Jessop, National; Paul Moulton, National; Harry Cobe, Jackson; Charles Basle, Jackson; John LeCain, Stutz; Albert T. Hoyt, National; Harry Endicott, Stutz, and David L. Gallup, Studebaker. Still other entries have been made conditionally, but their names have not been made public.

In addition to the automobile events there will be nine motorcycle races, as follows: Fifteen miles, professionals; five miles, amateurs; 25 miles, professionals; 10 miles, professionals; 15 miles, special match (Teddy Carroll, Springfield, Mass., Indian, and Glen Crandall, Boston, Thor); 10 miles, professionals; five miles, amateurs; 25 miles, professionals, and 20 miles, special match.

Among the other riders entered for these events are: H. F. Smith, Medford, Mass.; George J. Downes, Boston; R. L. Coes, Worcester; C. R. Burbank, Dover, N. H.; E. C. Haines, Lynn, Mass., and Bragg Helliwell, Boston.

LONG DISTANCE TOUR IN VELIE.

Capt. and Mrs. George J. BeGole and Ralph Newcomer, who left St. Joseph, Mo., Aug. 7, for a vacation trip in Mr. BeGole's Velie touring car, made by the Velie Motor Vehicle Company, Moline, Ill., have returned home after making a total distance of 2382 miles without a puncture or breakdown of any kind.

MAY TOUR TO COAST.

W. McK. White of the Marion Motor Car Company, Indianapolis, Ind., maker of Marion cars, at a recent meeting of the Indiana Automobile Manufacturers' Association, suggested that the 1913 tour of the organization be over the proposed $10,000,000 stone highway to the Pacific Coast. The suggestion was made with the idea that the tour take the form of a pathfinding journey and mark the route so that tourists might follow the trail to San Francisco in 1915 from the Panama-Pacific exposition. The proposition was referred to the committee on runs and tours with instructions to report back within 30 days. This run would take the place of the annual Four-States tour and would be for Indiana manufacturers exclusively.

HUPMOBILE WINS FIRST PRIZE.

At the recent first international motor exposition held at Turin, Italy, at which were represented a great portion of the world's most famous motor cars, ranging in price from $500 to $10,000, the Hupmobile runabout, made by the Hupp Motor Car Company, Detroit, won first prize for automobiles of less than 110 cubic inches displacement. In this contest all points of the car were taken into consideration, even to the examination of the general efficiency of all bolts, their strength against road shocks, spring resiliency, maximum amount of weight, hardness of metals used in the different parts, etc. After this severe test, the Hupmobile stood perfect and was given first prize, a beautiful hand-worked gold medal.

ANNUAL IMPORTERS' SALON.

Following the custom of several years past, the 1913 American automobile show season will be inaugurated by the annual Importers' Salon in the Hotel Astor, New York City, Jan. 2-11. With one or two exceptions all of the foreign makes represented in this country will participate in this season's Salon. Among those which will be displayed by Paris exhibitors are: De Dion-Bouton, Isotta-Fraschini, Lancia, Mercedes, Metallurgique, Minerva, Panhard and Renault. This list represents five nations: France, Germany, England, Italy and Belgium.

MONEY FOR GOOD ROADS.

With no systematic canvass, when the matter of good roads was agitated recently at Hartford, Wis., the city in which the KisselKar is made by the Kissel Motor Car Company, the citizens of the city subscribed $1200. This amount, coming from a city of 3500 people is an indication of the interest, as well as the realization of the people of Wisconsin of the advantage of good roads. The $1200 collected, when added to the state and county subsidies, will give the vicinity of Hartford about $8000 worth of macadam roads the coming year.

FUTURE OF RUBBER MARKET.

The United States Rubber Company now has 80,000 acres of land in Sumatra planted in rubber trees, some 2,500,000 trees being set out, and already the prospects of the investment are held to be extremely promising. It is predicted that in time the company will be rendered independent of the open market, except for the finest Para. The oldest of the trees planted are now between two and three years old and as best results are obtained only by tapping trees not less than five years old, it will be two or three years before rubber from that source is expected.

It has been figured by some that when the trees begin to yield fully, there will be a saving equal to 4 per cent. on the common stock, basing this figure on an estimated output of 5,000,000 pounds from the plantations. Even the production of 1,000,000 pounds would mean an addition of a full 1 per cent. on the $25,000,000 United States rubber common, taking the value of crude rubber at $1 a pound, and estimating that it will cost the company 50 cents a pound to produce it in the plantation.

MARION SHOWS ECONOMY.

The trip recently finished by F. J. Sleght of Indianapolis, Ind., in his Marion car, made by the Marion Motor Car Company, Indianapolis, bears special significance. For 2086 miles, through Indiana, Ohio, Pennsylvania and New York, Mr. Sleght, with three companions drove his car at an average cost of .5 cent a mile a passenger. Throughout the trip Mr. Sleght kept an accurate record of gasoline and oil consumption, charges for storage, washing and polishing, as well as incidentals and hotel expenses. The average cost of gasoline was 18 cents a gallon and that of oil 60 cents a gallon, the total cost of the former being $24.12 and the latter $7.20. For storage, washing and other incidentals there was expended an additional amount of $12.49.

What an awful game of chance we sometimes play on the checkerboard of Life!
How narrow is Life's victory over Death at times!
What a contrast is here presented! What an object lesson this scene portrays!

Absolute control and **perfect safety** on the one hand; on the other an "unruly, balky" machine, whose seemingly greatest ambition was to bring its occupants face to face with disaster.

Picture for yourself the story:

Two cars traveling the same country road—a rainstorm overtakes them. Reaching a treacherous, slippery curve—

ONE CAR with scarcely any noticeable slackening of speed rounds the curve and **passes on in perfect safety.**

THE OTHER at the critical moment, **skids,** and in a flash, plants itself in front of the onrushing trolley.

A mass of wreckage, "nerve-shattered" passengers and a lasting memory of what might have been if the trolley car had not been stopped.

One Car was skid-proofed with Weed anti-skid Chains. **The Other** was not. Take the lesson home.

Weed Chains

Absolutely Prevent Skidding

Are you still taking your life in your hands by refusing to take the necessary precaution against the dangers of skidding? Are you still unwisely depending on "rubber alone" for the safety of yourself, the occupants of your car and other road users?

Make safety yours—take no chances. Fully equip your own car with Weed Chains today and **insist,** for your own protection, that other drivers do the same.

Weed Chains cannot injure tires because "they creep;" are put on in a minute without the use of a jack or other tools. Use them on all four tires.

Weed Chain Tire Grip Co., 28 Moore Street, New York City

THE SELDEN CAR.

Sturdy and staunch, powerful and strong,—a car ready to at all times satisfactorily perform any service you may ask of it.

A new standard of value in the automobile world. The Selden Car is sold with complete touring equipment. Five models—$2250 to $2600. Good territory still open to live agents.

SELDEN MOTOR VEHICLE CO., Rochester, N. Y.

GASOLENE GALLON GAUGE

For Automobiles and Motor Boats.

For measuring the amount of gasolene in supply tanks.

The numbered markers are slidable and may be adjusted to show the number of gallons in any given tank whether it is square, round, oval or irregular in shape.

The depth of each gallon is the same in square sided tanks.

In round or oval tanks the depth of the gallons will be less towards the middle of the tank.

The outside level marker shown is to register the amount in the tank at any given time.

Handsomely finished in black stained wood, 15 inches long, with 20 brass markers.

If your tank holds more than 20 gallons, extra markers will be inserted as ordered.

Price 50 cents postpaid anywhere in the United States.

Send Express or Postoffice money order. Stamps accepted.

SPECIAL

Extra long gauges made to order for very deep tanks; not more than 24 inches in length, with markers numbered from 1 to 30 as may be required.

Price 75 cents, postpaid anywhere in the United States.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. TRY THEM NOW.

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

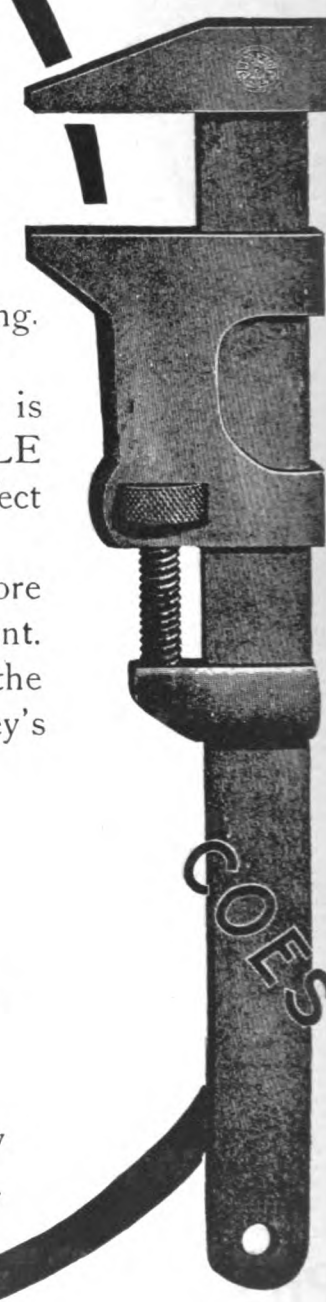
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

The Pilot "The Car Ahead"

Fourth Successful Year—Three Great Models

Pilot 40, four cylinders 4½x5. Brake test 53 horsepower. 120" wheelbase. Roadster and Touring Car. Price $2000.

Pilot 50, four cylinders 4½x6. Brake test 59 horsepower. 126" wheelbase. Touring Car, five or seven passenger. Price $2250.

Pilot 60, six cylinders 4x6. Brake test 67 horsepower. 132" wheelbase. Touring Car, five or seven passenger. Price $2500.

Electric Lighting, Electric Starter

The famous **GRAY & DAVIS** system of Lighting and Starting. A more expensive system for lighting and starting to buy than others, but more reliable and efficient than **any** other. **Power tire pump** operating from flywheel to inflate tires.

Press a lever to **start your motor, to light your lamps** and **fill your tires with air.**

Beautiful upholstered jewel bodies, cushions 11" deep and handsome ventilating windshield of special design are exclusive features.

Every convenience and comfort. As silent as a watch.

The most beautiful and powerful cars constructed this year. **TEETOR "T" head motors** in all models, the simplest and most powerful motors built in this country. Not a grease cup on them. **Most perfect oiling system ever devised**—it cannot go wrong. **Cooling system** so efficient that a Pilot has been operated 4000 miles in the New England hills the past Summer **without** a fan.

Nickel babbitt bearings in motors (not bronze), the best material for bearings ever found. Motor has **150 less parts, weighs 150 pounds less** and delivers to rear axle (straight line drive) far more horsepower than any other motors of similar piston displacement.

Speed and economy records everywhere. Noted for its hill-climbing ability. Won the Algonquin Hill Climb in Chicago three successive years and cut 25 seconds from the previous record for its class at Dead Horse Hill at Worcester, Mass., in 1910.

The Strongest Built Car in America

with a record for unfailing service in the mountains and deserts which have been the graveyard of so many automobiles and where many manufacturers do not care to send their cars. **Let us send the proof.** If you could visit our factory and see the way we construct Pilots, see the material we use, you would realize why we have a "no trouble" car and why we are selling so many of them in sections where other cars cannot stand the service.

Every Part of Machinery Accessible Without Soiling a Coat Sleeve

GUARANTEED FOR ONE YEAR

Some manufacturers guarantee their car for several thousand miles. It is **different** with the Pilot. You can ride 25,000 **miles** if you want in one year, either on the Massachusetts Boulevards or the Deserts of Arizona and Nevada—it does not matter—the Pilot Guarantee is with you all the time. **A long list of satisfied owners. Let us send you their opinion of the car.** There is so little trouble with a Pilot that some of our agents are advertising to take care of the car for their customers the first year **free of all expense. How many agents of other cars dare do this? This is the proof of reliability.**

Read the Specifications

Full-floating rear axles (absolutely guaranteed), Brown-Lipe differential, famous National oil-tempered springs, wheels of great strength with large spokes, double internal expanding brakes, Warner transmission (heavy enough for the strongest motor), one of the most efficient radiators ever designed (German Silver finish), cone clutch with auxiliary springs under leather facing, making very easy engagement; control in centre of car for convenience of driver, V-shaped torsion rod on rear axle and absolutely reliable irreversible steering gear. The drive is shaft and bevel gear with double universal joints between clutch and transmission, and transmission and differential, and allowing **straight line drive.** Only the best and highest priced cars use this expensive but correct drive. New Departure (Hoffman Balls) Hess-Bright and F. & S. Bearings used where best adapted for service. Springs, front half elliptic 38x2, rear very long half elliptic 52x2, insure easy riding. Genuine white lead and oil paint, 11-inch cushions and heavy Turkish upholstering on handsome jewel bodies with entrance from either side—an exclusive feature—add beauty and refinement to these wonderfully constructed cars.

Regular Equipment

Mohair top and hood, Ventilating windshield, Warner Autometer, Schebler Carburetor, Eisemann Magneto, tire power pump, electric lights and electric starter (Gray & Davis system), electric and bulb horns, tool kit, tire repair outfit, jack, robe and toe rails, 5 electric lamps including large electric headlights, quick detachable demountable rims, Auto Hind Reflector and Never-Out License Brackets. Pilot 40—36x4 tires. Pilots 50 and 60—36x4½ tires. Nickel finish throughout. **The most completely equipped car ever sold.**

Special Equipment

WESTINGHOUSE AIR SPRINGS MAY BE HAD AS SPECIAL EQUIPMENT ON ALL MODELS.

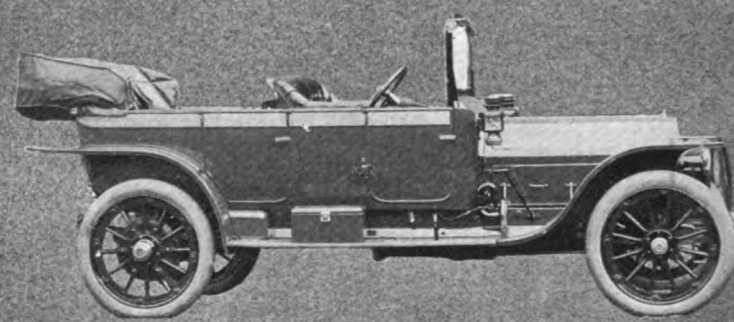
Dealers

If you have sold cars that have given poor service, the Pilot will redeem your reputation. If you are selling good cars, your competitor with the Pilot will keep you awake nights with his competition, the Pilot having so many good points **your** car does not possess. You will be on the defense **all the time,** no matter what car you sell—even the very highest priced car. You will find your car will have to "step lively" to make even a showing with the Pilot in **hill climbing, flexibility, general road work** or any of the various and special tests which the shrewd buyer requires to be performed satisfactorily before parting with his money.

Varnish No Longer Sells a Car

The wise car buyer looks under the body. He wants to know how strong are the **frame** and **axles** and what kind of **bearings** are used. He wants a dependable **clutch** that takes hold gradually and **will not slip** and the **transmission** absolutely reliable and the gears of the best alloy steel. He wants **twelve** spokes in the wheels and the spokes must be 1¾" or more or no sale. He must have a **drive shaft** at least 1⅛" **in diameter** and material **chrome nickel steel.** He wants his machinery **accessible** so that adjustments can be easily effected when necessary and without great expense.

You can satisfy him on every essential with a Pilot. She is built right. **No complicated machinery in a Pilot.** Adjustments are so easily made that any owner with but little mechanical knowledge can easily care for his car. And the equipment the **finest and most complete** ever offered. Everything needed on a car is there, including the famous Gray & Davis system for Lighting and Starting, the finest electric lighting and electric starting system yet devised, and the price—quality considered—the lowest in the land.



Agents Wanted in Territory Not Taken

If there is no Pilot Agent in your territory **write us at once** for the greatest agency proposition made by any manufacturer or distributor. We **co-operate** with you in your territory and do not require you to tie up a lot of money in deposits. If you have another car agency, or desire an agency, or are thinking of purchasing a car, you cannot afford to neglect this opportunity of knowing more about the Pilot—**the car without a mechanical defect**—but **write at once** for beautiful art book showing the Pilot models in colors and a complete and detailed description of the cars; also get our **agency offer** in new territory. **It will interest you.**

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL."

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

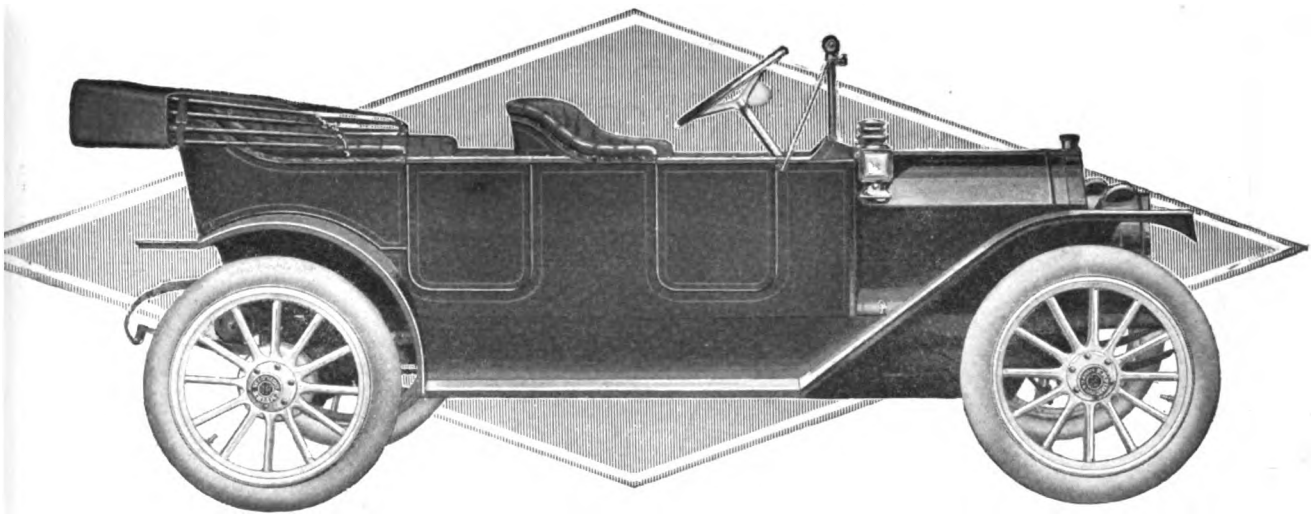
The 3⅛ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Au to Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26.00	$28.00	$36.00	$28.50
	3½-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3⅛-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—Add $3.00 to above Price Lists. (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)



For Use on AUTOMOBILES and MOTOR BOATS

You want the Best? Ask your DEALER for the "CHELSEA"

On Sale by Leading Jobbers and Dealers

COMPLETELY EQUIPPED EMPIRE

---and Now You Get *Class* for $950

Thousands are in the market for a five-passenger touring car of moderate size and price. They have avoided buying the average small car because of its usual unsightly appearance and its entire lack of dignity and style. But here is a car that is winning them all---a car not too large yet magnificent in appearance, a car low in price yet with character and dignity heretofore only found in cars of the *five thousand dollar class.*

Empire—"The Little Aristocrat"

THE $950.00, fully equipped Empire five-passenger Touring Car is daily winning hundreds of this intelligent cultured class. "The Little Aristocrat" has commended itself to these purchasers because of its efficiency, its quality construction, its low maintenance cost, and the refined elegance of its appearance. It will appeal mightily to **you** if you want a car of moderate price and size; **particularly if you demand a real car** instead of an imitation, **and the beautiful** instead of the unattractive.

A year ago there were two thousand Empires in use. Six months ago we planned for our usual healthy increase. But even we underestimated the merit and popular appeal of the five-passenger Empire Touring Car. So, early in September **we were forced to establish a second factory** and to triple our output.

Examine "The Little Aristocrat" five-passenger Empire Touring Car and you will understand this amazing growth and success. Judge it from every angle. **Compare the Empire with cars at any price for beauty of design.** The body lines are clean-cut, with flush sides and straight rail. The dash and cowl are of one solid piece of aluminoid steel. The free running board, graceful fenders and big artillery wheels with big hubs and hub caps lend it distinction. Large commodious doors, wide seats with luxurious deep cushions assure thorough comfort for five passengers.

Thoroughbred speed, surplus power for any hill, and unusual strength is apparent in every detail of the chassis. Consider the 17-inch steering wheel as against the average small car type of 15-inch. Ponder the safety margin and insurance against accidents in steering knuckles, axles and brakes as big and strong as those used in cars with double its weight. Think of the Empire's 9-inch disc type clutch in place of the customary 5-inch type.

The Empire is sold completely equipped with Mohair Top and envelope, Wind-shield, Prest-O-Lite tank and Speedometer.

Look up the Empire. Ride in it. Complete information in our Empire "Little Aristocrat" folder. Write for it.

EFFICIENCY DETAILS

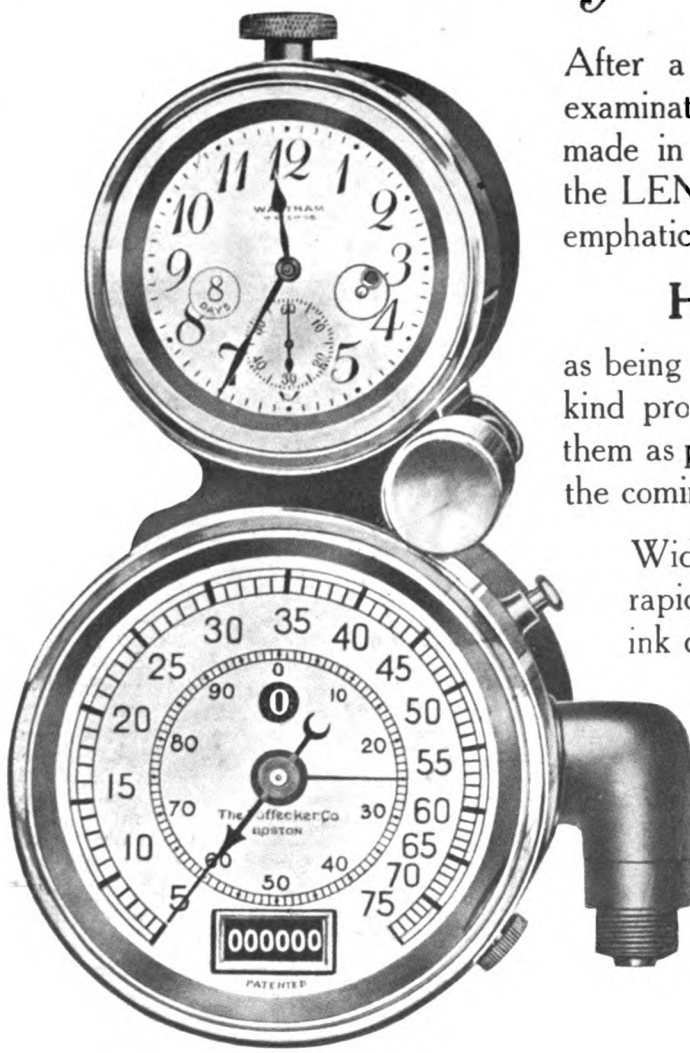
Unit Power Plant—Long stroke motor. Cylinders cast in pairs. Valves individually enclosed.
Clutch—9-inch Multiple disc (raybestos lined) type.
Transmission—Selective type. Three speeds forward and reverse. Mounted on annular bearings throughout.
Cooling System—Thermo-syphon. Big radiator in conjunction with belt driven fan.
Valves—High carbon valves, fully enclosed, noiseless.
Lubrication—Constant level, force feed.
Ignition—High tension magneto. Set spark.
Steering Gear—Full worm gear type. Irreversible.
Control—Single lever, center control.
Brakes—Service, internal expanding; Emergency, external contracting.

Dealers

No need to tell you about the demand for a quality five-passenger touring car designed on artistic Empire lines and selling at $950.00. You know the unlimited opportunities in that direction.

Perhaps you do not know how broad a dealer's proposition we make. You ought to.

Write or wire us for information. There is still some open territory.



EFFICIENCY DETAILS

Rear Axle—High-grade construction, with Hyatt roller bearings throughout. Three-quarter floating.
Front Axle—I-beam section drop forged.
Springs—Oil tempered. Three-quarter elliptic rear, semi-elliptic front.
Wheels—Artillery type, 32" Q D. Rims.
Frame—Pressed Steel, channel section, dropped, giving low center of gravity.
Body—Aluminoid steel, wood trimmed, four doors, full vestibule, seats with luxuriously buffed leather cushions.
Gasoline Tank—Capacity 12 gallons.
Fully Equipped—Equipment includes Mohair Top, Top Envelope, Wind-Shield, Speedometer, Prest-O-Lite Gas Tank, Horn and Complete Tool Equipment.

THREE PREMIERS
OF THE
MOTORING WORLD

Specialized Publications For Owner, Industry and Trade

The AUTOMOBILE JOURNAL—Devoted to the Interests of the Owner and User of the Motor Vehicle for Pleasure. The Most Comprehensive Popular-Priced Magazine Published. The year, 24 issues, $1; the Copy, 10 Cents.

The MOTOR TRUCK—The National Magazine of the Power Wagon Industry, Promotive of the Interests of the Manufacturer, Distributor and Owner of Industrial Transports. The Leader of Its Class. The Year, Monthly, $1; the Copy, 15 Cents.

The ACCESSORY and GARAGE JOURNAL—The Only Publication in America Given Over to the Motor Car Industry and Allied Interests. Exclusively a Medium of Trade Information for the Trade. The Year, Monthly, $1; the Copy, 15 Cents.

TEN STANDARD MECHANICAL AUTOMOBILE HANDBOOKS

The A B C OF INTERNAL COMBUSTION ENGINE MAINTENANCE AND REPAIR—The Most Complete Work Ever Written of Gas Motors. Not Principles, But Practise. Illustrated by More than 50 Cuts and Drawings and Eight Full-Page Charts. Price 35 Cents.

The A B C of MAGNETO IGNITION SYSTEMS—Every Detail of Construction, Maintenance and Care, Covering Standard Makes of Instruments and Their Service, Illustrated by More Than 100 Cuts, Drawings and Wiring Diagrams. Price 35 Cents.

The A B C OF CARBURETOR CONSTRUCTION, MAINTENANCE AND REPAIR—Theory and Practise of Carburetion by All Recognized Methods and Devices Exhaustively Reviewed and Described, with More Than 125 Special Illustrations and Charts. Price 35 Cents.

The A B C OF BATTERY IGNITION SYSTEMS—All Standard Constructions and Their Adaptations in Practise, Together with Special Applications and a Series of Wiring Diagrams for All Installations, Shown by 50 Illustrations and Charts. Price 30 Cents.

The A B C OF MOTOR CAR OPERATION—A Complete Text Book of Theory and Practical Experience with All Types of Standard Automobile Vehicles, Systematically Written and Illustrated by More Than 200 Cuts and Full-Page Charts. Price 50 Cents.

OVERHAULING, REBUILDING AND REPAIRING THE MOTOR CAR—A Treatise of All Conventional Types of Cars with Advice for Meeting All Service Conditions, Based on Practical Experience. Containing More Than 200 Illustrations and Diagrams. Price 50 Cents.

The A B C OF MOTOR CAR CHASSIS MAINTENANCE AND REPAIR—Systematic Presentation of Conditions Resultant from Use, and Means for Remedy and Restoration Applied from Practical Knowledge. Contains More Than 50 Cuts and Charts. Price 25 Cents.

MAINTENANCE AND REPAIR OF MOTOR CAR TIRES—An Exposition Treating of Tire Service from the Viewpoint of Economy, Founded on Manufacturing, Repairing and Operating Experience. Illustrated by More Than 100 Cuts and Charts. Price 25 Cents.

LIGHTING THE MOTOR CAR BY ELECTRICITY—A Comprehensive Work on All Current Producers, Lamps, Lights, Installations and Practical Wiring Diagrams for Every Type of Vehicle, Singly or in Combination. More Than 75 Cuts and Diagrams. Price 25 Cents.

The A B C OF AERIAL NAVIGATION—A Veritable Encyclopedia of Aerial Science, Dealing with the Latest Designs and Types of Airships, Construction, Materials, Equipment, Control, Etc. Containing More Than 200 Illustrations and Charts. Price 50 Cents.

FULL SET, 10 VOLUMES, $3.60.

¶ The Overland Model 69T offers real value for your money. And when we say "value" we mean just that---a greater amount of real worth and a higher percentage of efficiency than were ever before offered for less than $1000. Look the car over. Compare it, critically, with others costing up to $1200. Then you will be convinced of the truth of this statement. You will realize more fully, too, what a factory capable of large output---40,000 cars this year---means in the way of economy to the automobile user.

Our 1913 catalogue will tell you more fully of this car.

THE AUTOMOBILE JOURNAL

VOL. XXXIV, No. 6 OCTOBER 25, 1912 Price, $1.00 the Year

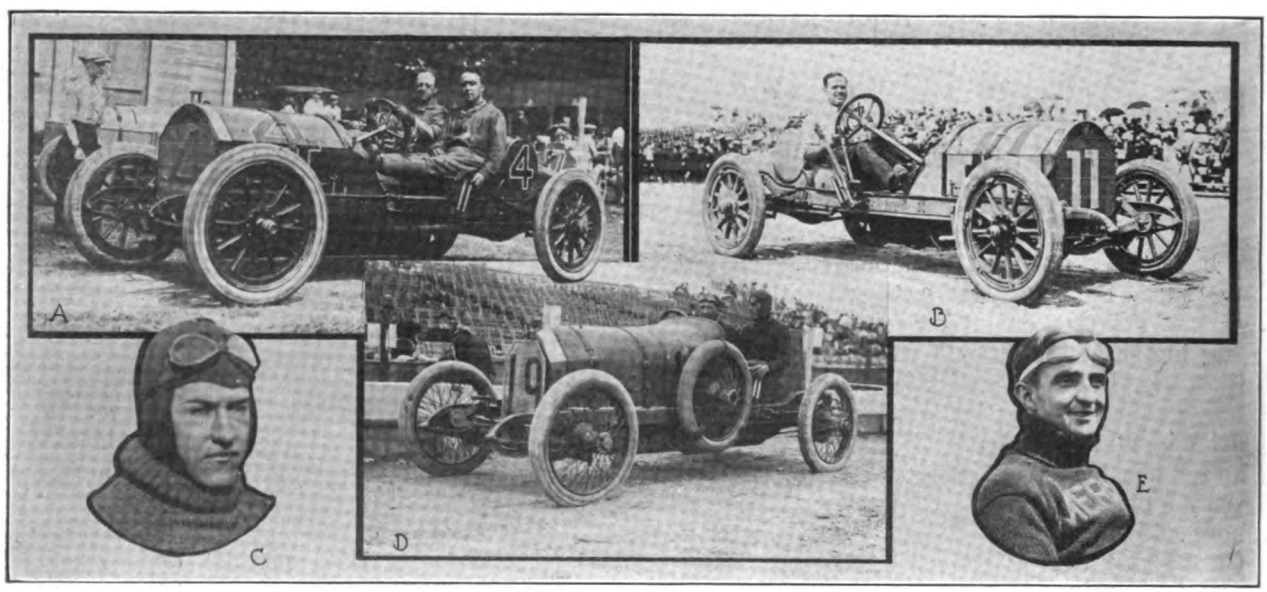
AMERICAN RACING RESULTS FOR 1912.

Resume of Work Done by Various Makes During the Season Indicates Mercer Cars Head the List of Winners—Stutz a Strong Contender for Premier Honor —Burman Takes First Place Among Drivers—Tabulated Scores.

IF IT were possible to adopt some figure of merit and thus determine what might be regarded as a champion car for any given racing season, the result would prove of decided interest. But it is not. Herewith are presented tables showing the number of times cars and drivers started and finished with place in some 40 meets throughout the country during 1912. This record probably includes the work accomplished in over 125 contests, in some of which many of the cars listed were not eligible. For this reason, alone, it is impossible to adopt a figure of merit which would fit the case. Moreover, the races were for distances varying from .5 to 500 miles. Some were held on specially constructed speedways, and others on dirt tracks or over road courses. There seems to be no method by which it is possible to arrive at a definite conclusion as to which car deserves the title of champion.

Spencer E. Wishart at the Wheel of the Mercer Which Created New World's Dirt Track Records at Columbus, O., Aug. 26.

But on the face of the returns, it would appear that the Mercer, made by the Mercer Automobile Company, Trenton, N. J., is entitled to the position at the head of the list. The figures show that it started 80 times; finished in first place, 25; second, 22, and third, 18. It took part in nearly every meet of the year. It competed with cars of twice its piston displacement. It finished in third place in the longest race of all, the 500-mile contest on the Indianapolis motor speedway, Memorial Day. It set new world's dirt track records from 75 to 200 miles. There is no way to reach a definite decision, but the figures tell an interesting story.



Standing next to the Mercer on the list is the

Digitized by Google

Case, made by the Case Threshing Machine Company, Racine, Wis., with 50 starts, 13 firsts, 20 seconds and 10 thirds. But many of these Case victories were made by specially designed racing cars. There were practically no stock car races during the year, and of course the Mercer, or any other car, can lay no claim to stock car qualifications, even though nothing but stock cars were raced. The Mercer will make no such statement, inasmuch as some of its performances were made with machines fitted with wire wheels, and others were frankly stated to be Mercer specials. But it may be assumed that aside from a slight difference in the piston displacement, hardly more than a few cubic inches in any instance, the Mercers entered in all events were no different from those sold in open market, and in many races the leading position any the less secure.

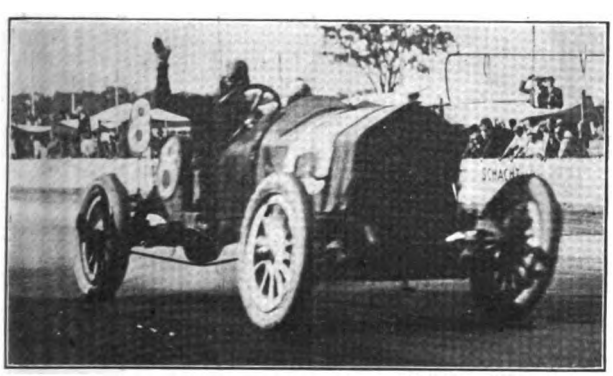
Last year the National, made by the National Motor Vehicle Company, Indianapolis, Ind., occupied first place, and the Mercer was fourth. This year the positions are exactly reversed. But it should be stated in this connection that the National company withdrew from racing early in the year, after Joseph Dawson won the international championship at the Indianapolis speedway in the 500-mile race. In 1911 it was entered 117 times, with 45 firsts, 30 seconds and 19 thirds. This year it started 41 times, and secured 12 firsts, six seconds and eight thirds.

The most serious contender with the Mercer for premier honors is the Stutz, made by the Ideal Motor Car Company, Indianapolis, Ind. It occupies fifth place on the list, with 37 starts,

The Mercer Racing Team for 1912: A, Harvey Ringler; B, John De Palma; C, Spencer E. Wishart; D, Hugh Hughes and the Wire Wheels; E, Edward Pullen.

they were privately owned machines, driven by the owners.

The Benz holds third place in the list, with 43 starts, 19 firsts, 12 seconds and seven thirds. Here again it is necessary to interpose an explanation. The racing season of 1912 has been peculiar for the number of so-called barn storming meets, most of which have had the sanction of the contest board of the American Automobile Association, but held on small half-mile tracks on which it has been possible for only a few cars to compete at a time. Many of the Benz victories have been won at such meets, and in several events but two cars competed. This does not necessarily detract from the performance of the Benz car, but it certainly does not make the Mercer's claim to 10 firsts, 10 seconds and seven thirds. Like the Mercer, the Stutz was entered in all sorts of competitions. Their piston displacements compare very favorably. There was 31 seconds difference between the two in the 500-mile race, the Stutz being awarded fourth prize. The Mercer finished with place 80 per cent. of the times entered, the Stutz 73. Both used wire wheels in the same races. In many other respects their performances were somewhat identical.



It may also be stated that the results of the year indicate that the small cars showed up to better advantage than the larger. The situation with reference to the 500-mile race has been commented upon. Mercer cars finished first and second for the Aurora trophy, Aug. 30. Stutz cars

Digitized by Google

finished first and second for the Illinois trophy the same day.

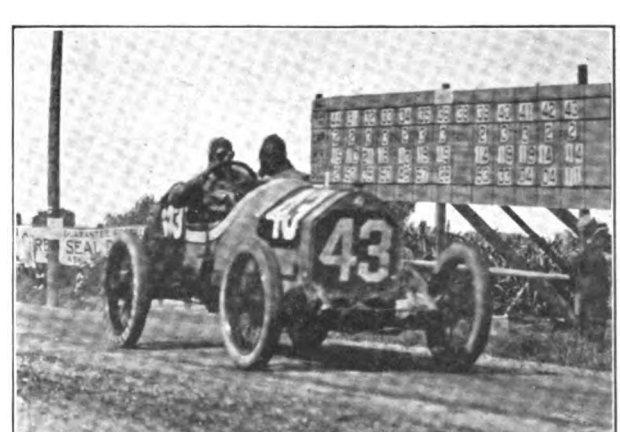
One of the most remarkable features of the 1912 contest for the Vanderbilt cup was the running of the Mercer, which finished in second place, 43 seconds behind Ralph De Palma's Mercedes. Again the Stutz was fourth. And two days later, the Stutz finished third in the race for the Grand Prize, the second time an American car has finished with place for this award, and the smallest car ever to finish in any event of this character. The performance of these two cars was easily the big surprise of the year.

New records were not numerous during the year, although the contest board of the American Automobile Association has not summarized the results as yet. Teddy Tetzlaff in a Fiat created a new world's road race record at Santa Monica, Cal., May 4, and several new marks were set by Dawson in his National during the 500-mile race.

Joseph Dawson Winning 500-Mile Race in His National.

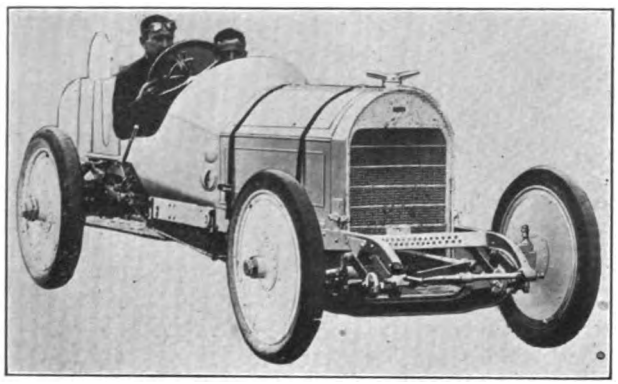
Aside from these it will be conceded, no doubt, that the marks created by Spencer E. Wishart, the first time he ever appeared in any race at the wheel of an American car, in the 200-mile race at Columbus, O., Aug. 25, with a Mercer, are the most important. These were one-mile dirt track records for 75, 100, 150 and 200 miles.

Coming now to the matter of drivers, the second table herewith sets forth their performances in much the same manner as that of the cars. Last year the first 10 names on the list were: Ralph De Palma, Disbrow, Burman, Hughes, Wilcox, Merz, Raimey, Kulick, Tower and Knipper. This year they are: Burman, Disbrow, J. Nikrent, Kyle, Raimey, Whalen, Ringler, Lewis, Barber and Menker. It is even more difficult to select a champion driver, as is evident from a study of the table.



Burman heads the list by reason of the fact that he has started more times than the others. It should be remarked that both he and Disbrow were members of so-called barn storming troupes. The same thing will apply to J. Nikrent, Kyle, Raimey and Whalen. Ringler drove the Mercer, Lewis the Stutz, Barber the Warren and Menker the Kline-Kar. Burman was at the wheel of the Benz, Ohio and Cutting; Disbrow the Case and Simplex; J. Nikrent the Case; Kyle the White; Raimey the Ohio and Whalen the National.

Charles Merz and Stutz with Which He Took the Illinois Trophy.



The name of Barney Oldfield reappears this year, after a lengthy disqualification. It will be noted that some of the best known names are located well down the list. Kulick, for instance, who was at the wheel of a Ford car in 22 races last year, does not appear at all in the 1912 list, because the Ford Motor Company withdrew from racing this year. Knipper only drove in one race during 1912.

Joseph Dawson, who won the 500-mile race in a National, drove in no other event. Last year he was at the wheel of a Marmon in three events, and all of his previous racing experience had been with cars of that make. It was in 1910 that he

Gilbert Anderson Driving Stutz Which Finished Third in Grand Prize.

Digitized by Google

Robert Burman and Cutting Car Which Helped to Place Him at the Head of the List.

came into prominence by winning five of the biggest victories of the year. Most of his driving has been without stop, but in the 500-mile race he relinquished the wheel to Donald Herr for 90 miles.

Teddy Tetzlaff, holder of the world's racing record, won his first long distance race in the Santa Monica road event of 1910, creating a new American record with a Lozier. He has been driving Fiat cars for the past two years. He not only won the Santa Monica race this year, but the 200-mile and 250-mile events at Tacoma, Wash., July 5 and 6.

Caleb Bragg, the new possessor of the Grand Prize, has been a consistent contender in long distance events for some time. Last year he drove in four races. The list this year shows he started but three times, his only other victory being in a five-mile event at Los Angeles, May 5. He drives a Fiat.

Ralph De Palma, who now holds the Vanderbilt cup, stood at the head of last year's list of racing drivers. Most of his victories were in short events, as always was true of his driving previous to 1912. His experience in the 500-mile race, when his machine failed him on the next to the last lap, was repeated in the Grand Prize, with the exception that the accident occurred on the final lap and on the home stretch. He not only won the Vanderbilt cup, but the Elgin National trophy and the free-for-all at Elgin, and the Jepson cup at Santa Monica, May 4. The last named race was won in a Mercer, and the others in the Mercedes.

Louis Disbrow and Specially Designed Case Machine.

Harry Endicott started 14 times last year, driving an Inter-State. This year he was at the wheel of a Mason, taking the Jencks award at

Two starts without place—Campbell, Dingley, Horan, Knight, Sebastian.

One start and one first—Bayse, Colnot, David, Dawson, A. Hayes, Higgins, Iselin, Jackson, Jessop, Kingsley, Knipper.

One start and one second—Ball, Bishop, Brown, Casey, Cook, Duval, Ervin, Fetterman, Klipstein, Knox, Mason, McKelvey, Morton, Pew, Riley, Stolz, Weaver.

One start and one third—Arent, Beach, Bocknauer, Christie, French, J. Hayes, Meyer, Millichap, Mitchell, Ready, Rossi, Schaubert, Stouffer, Strauss, Trussel, Warren, Wilson.

Also ran—Almy, Anthony, Barnes, Bennett, Charles, Elliott, Fountaine, Hearne, Henning, Jeffkins, Krauss, Kniffen, Liesaw, Lowell, Marquette, Matthews, Miller, Nelson, L. Nikrent, Ormsby, Rickenbacker, Rooney, Rosher, Shain, Snyder, Wood, Wordingham, Zengel.

the Pabst Blue Ribbon trophy in a Mason car, drove an Abbott-Detroit last year. Earl Jackson in a Reo took the road race at Fresno, Cal., April 21. George Joermann won the Chanslor & Lyon trophy at Santa Monica, May 4, in a Maxwell. Charles Evans won a 100-mile race at Tacoma, Wash., July 5, in a Studebaker Flanders.

The Mercer team may be said to have been Numerous other drivers, both amateur and professional, helped to create the Mercer's record for the year.

The Stutz team was composed of Gilbert Anderson, Charles Merz, David Lewis and Earl Cooper, with Charles Bayse driving in one road race. Anderson was at the wheel in the Grand Prize, and finished fourth for the Vanderbilt cup.

Digitized by Google

Merz took the Illinois trophy and finished in fourth place in the 500-mile race. Cooper won a 150-mile race at Tacoma, and Lewis one of 100

Caleb Bragg, Winner Grand Prize, and Ralph De Palma, Vanderbilt Cup Victor.

miles at Old Orchard. Bayse won the Levis trophy at Bakersfield, Cal. Other drivers assisted these in winning several shorter events.

Thus is set forth, briefly, the efforts of the more prominent drivers in the year's events. The tables tell the rest of the story. It should be stated in explanation of these, that in the list of cars, all E-M-F and Flanders machines are listed under the name of Studebaker. In the table of drivers William Chandler is credited four starts, in which he secured two seconds and two thirds. Chandler assisted Mulford at the wheel of a Knox on two occasions, once in the Elgin free-for-all and the other in the 200-mile race at Tacoma, after Mulford had become incapacitated. He is credited with one second and a third in these events, although Mulford also is credited with the same places.

G. V. EXPANSION PLANS.

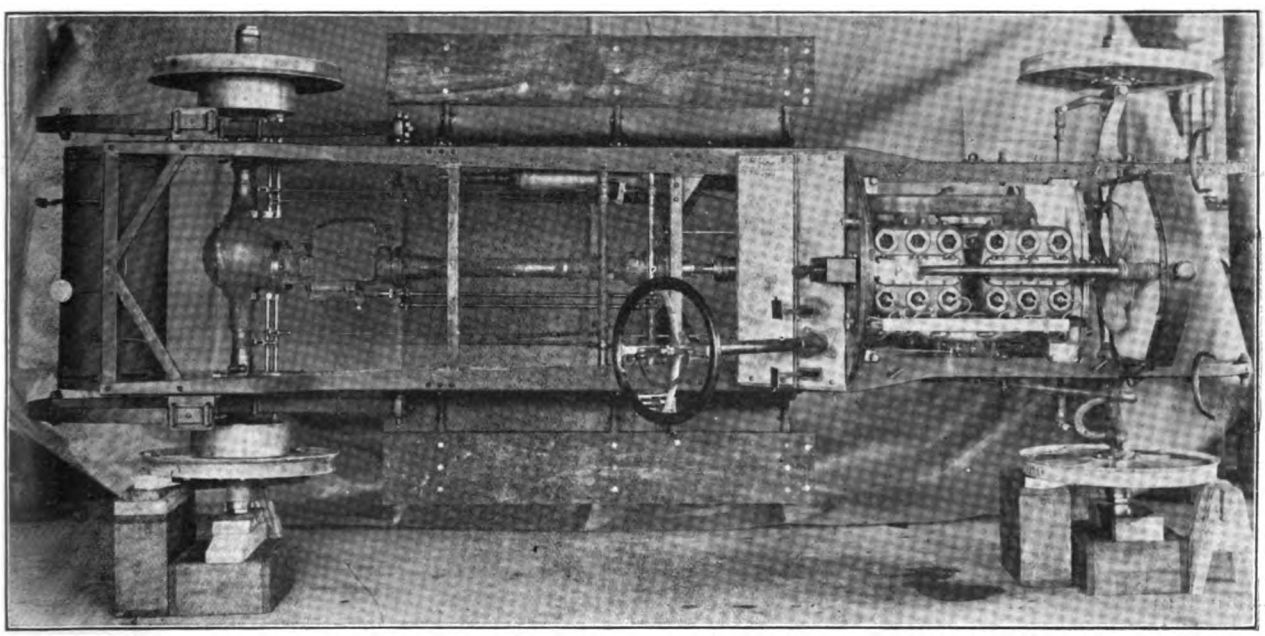
President P. D. Wagoner of the General Vehicle Company, Long Island City, L. I., maker of G. V. electric trucks, has announced numerous changes and appointments in the personnel of the company, designed to place it upon the highest basis of efficiency in the commercial vehicle world. The General Vehicle Company is one of the foremost in the country and it has enjoyed a large business. After the addition to its line of the American made Mercedes gasoline truck and the retirement of R. McA. Lloyd as vice president, it was expected that the organization would be materially changed and systematized.

These changes have taken place and President Wagoner announces the following appointments to the various departments: C. J. Squires, Jr., assistant to the president, is made sales manager; Irwin W. Howell becomes assistant to the president; G. W. Wesley is to be vice president; J. R. C. Armstrong, engineer of the electric division; H. G. McComb, engineer of the gasoline division; L. E. Lentz, superintendent of the electrical division; A. P. Bourquardez, confirmed as district manager of the New York sales office; C. V. Riede of the general sales office is transferred to the St. Louis office, and George Drake Smith to Cincinnati, O. In addition to these the Chicago territory will have at least two new salesmen who have been trained largely in the East, and the Philadelphia sales force also will be increased.

SALES ASSOCIATION FORMED.

The movement for a national organization of automobile dealers in the United States culminated at the convention recently held at Indianapolis, Ind., in the formation of the General Automobile Sales Association. Over 700 automobile dealers from every part of North America responded to the call for the meeting, which lasted two days and which is looked upon as the first annual session of the newly formed association. The purpose is to boost the business of automobile selling as a whole. The personal interests of the dealers and of the manufacturers are to be sunk in the general welfare and the enthusiasm displayed at Indianapolis indicated that the success of the movement is assured.

Details of the organization, including the election of officers and directors and preparations for next year's convention, to be held at Detroit, were placed in the hands of an organization committee by the convention. Signatures of mem-



Teddy Tetzlaff, Holder World's Road Record, and Joseph Nikrent, Prominent Driver.

bership were secured; the election of directors is to be held by mail, and it is proposed to have the directors elect the first year's officials.

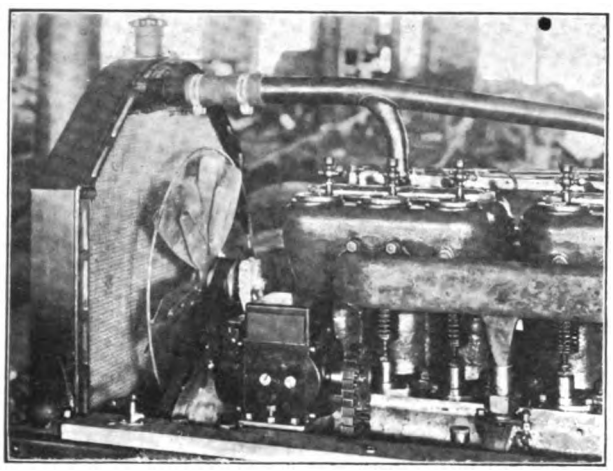
PALMER-SINGER OFFERS NEW BRIGHTON SIX.

ANNOUNCEMENT is made of a popular priced six-cylinder car by the Palmer & Singer Manufacturing Company, Long Island City, N. Y. This is a 6-45, but it will be termed the Brighton Six to distinguish it from the well known 6-60 chassis which will be continued with only slight changes in detail design, the modifications being in the nature of refinements. The new chassis will be fitted with a five-passenger touring type of body and a roadster. A four-passenger having two auxiliary seats, providing seating capacity for six persons is contemplated. The larger chassis will have a five-passenger touring body as standard, also a runabout body similar in design to that utilized on racing cars.

The Palmer-Singer Six-Cylinder Brighton Six Chassis, a New Model Announced for the Coming Season—Note the Simplicity and Accessibility of the Components.



In general appearance the new model follows very closely the attractive lines of the Palmer-Singer for the past five years. Some notable differences in design are apparent, however, among which is the adoption of a three-speed transmission combined as a unit with the rear axle and the cylinders cast in blocks of three instead of in pairs as with the 6-60 chassis. The equipment is very complete and provision is made for an air motor starter and an electric lighting system. The workmanship and material are of the same high quality for which the product of the company is noted.

The motor of the new chassis is of the four-cycle, water-cooled T head type with the cylinders cast in blocks of three and both the intake and exhaust ports are siamesed, a design making for compactness as well as facilitating the installation of auxiliary devices. A special grade of gray cast iron is employed and the cylinders are accurately machined and carefully ground to exact dimensions. The same special care is observed with the pistons and rings and all components of the power plant are subjected to rigid inspections before and after assembling and testing. The valves are constructed of a high grade material, ample in size, and their lift is adjustable. The actuating mechanism is of a special steel, heat treated and hardened and the liberal size of the components insures long life and correct timing. The intake members are located on the right with the exhaust at the left of the motor, and a noticeable feature of the exhaust manifold is its liberal size, a construction reducing back pressure to a minimum.

The bore is four inches and stroke five, a bore to stroke ratio of 1:1.25, and the piston displacement is 377 cubic inches. Although rated at 45 horsepower, it has developed considerably in excess of this rating in block tests, indicating that there is ample reserve energy.

Digitized by Google

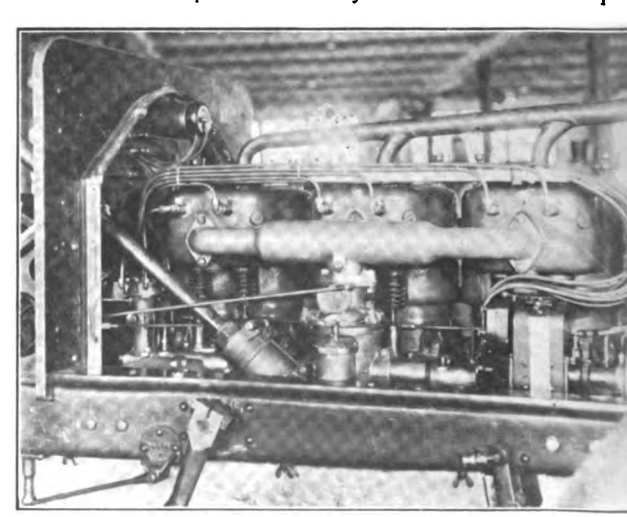
The crankcase is of aluminum having four arms, these being secured to the frame by large bolts, and a quality of the design is that the

Exhaust Side of the Brighton Six Motor, Illustrating Location and Method of Driving Lighting Dynamo.

power plant may be removed easily. Its centre of gravity is low, but ample road clearance is provided. The gears actuating the valves, etc., are spiral, constructed of a high grade steel, carefully cut and ground to insure quiet operation. They are located in front and are easily accessible through a large aluminum plate or housing.

Particular attention has been paid to cooling by the designer of the Palmer-Singer motor. The water jackets, cast integral with the cylinders, are liberal in size, especially in proximity to the exhaust valves. Cooled fluid is taken from the radiator by a centrifugal pump located midway on the crankcase on the exhaust side of the motor, and forced through the jackets to a large exhaust manifold on the top of the cylinders. The manifold is retained by studs and nuts, making it an easy matter to remove it and clean the water jackets when desired. The discharge pipe is fitted with flanges, bolt retained. The conduit of the water from the motor manifold to the radiator is by means of a rubber hose securely clipped. An exception to the usual practise of utilizing a tierod between the dashboard and radiator is noted.

Special Radiator Suspension.



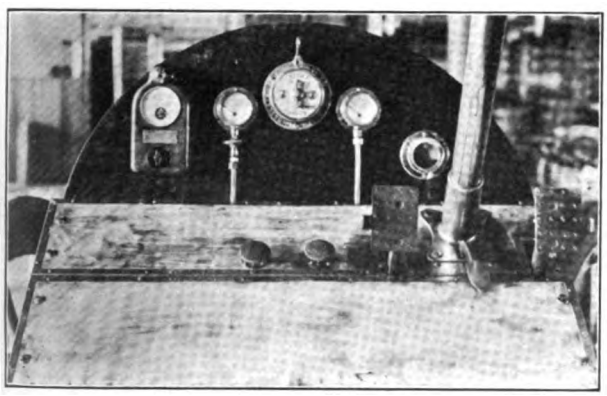
The pump is driven by an auxiliary gear from the half-time gear on the exhaust side of the motor, and an extension of the pump shaft carries the sprocket actuating the chain driving the lighting generator. The radiator is of the cellular type and the method of suspension is a design developed and patented by the company and one which has been successfully employed for the past six years. It consists of trunnions mounted on the vertical sides of the cooler, each borne within a spherical segment mounted within the radiator bracket. The latter is accurately machined to fit the spherical surface of the segment. The design not only absorbs all vibration, but frame stresses produced by traversing rough roads are nullified by the universal action of the spherical segments.

Lubrication is by splash, a constant level being maintained by a positively driven pump. An oil sight feed is fitted to the dash, enabling the driver to note at a glance the operation of the system. The carburetor is the C. R. G., type B, having three individual jets and a concentric float chamber. These jets operate automatically with the opening of the throttle, providing the proper mixture at various engine ratios. The carburetor is water jacketed, the heated fluid being conducted to and from the vaporizer by copper tubing. Provision is made for shutting off the water if desired. A feature of the chassis is the fitting of grease cups to parts subject to friction.

Dual Ignition Employed.

Two independent ignition systems are provided, comprising distributor and coil, and a high-tension magneto. The latter is located on the right, the intake side of motor, and is gear driven. The high-tension cables are conducted to a neat aluminum bus bar, thence to the spark plugs which are located in the intake valve caps.

The clutch is a multiple disc, of the built-into-the-flywheel type and operates in a bath of lubricant, the housing being oil tight. It is readily accessible for inspection or adjustment and the sup-



Intake Side of the 6-60 Motor, Showing Distributor of the Air Motor Starter.

ply of lubricant may be replenished easily through liberal openings. Immediately at the rear of the clutch is a substantial universal joint,

Digitized by Google

connection between which and the main universal member is by a short shaft. These components transmit the energy of the motor to the pro-

Dashboard of the Brighton Six: From Left to Right, Lighting Switch and Ammeter, Fuel Pressure Gauge, Elsemann Ignition Switch, Air Starter Pressure Gauge and Oil Sight Feed.

peller shaft which is of a high grade steel and of ample diameter. A noteworthy feature of the clutch and universal joints is their accessibility and the ease with which they may be disassembled.

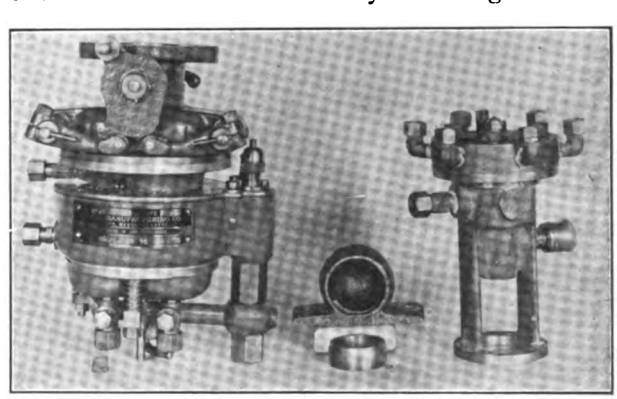
Large Universal Joints.

The large universal joint is enclosed in an oil tight torque head, comprising a spherically headed sleeve floating in the torque head proper, a construction caring for inequalities of road surfaces. A cross frame member carries the female components of the spherical joint, which are secured to the vertical flange of the cross member by ample sized bolts. Any longitudinal movement of the assembly is prevented by heavy radius rods secured to the rear axle housing and frame.

The propeller shaft housing is substantially constructed and is securely bolted to gearbox housing, which is a unit with the rear axle. The rear of the propeller shaft housing and transmission casing is ample in size and is heavily webbed, designed to withstand the stresses of hard service. The transmission is of the selective type, providing three speeds forward and reverse, and the material and workmanship are in keeping with the Palmer-Singer policy.

The rear axle is of standard design, of the floating type, and large sized New Departure bearings are utilized in the wheels. The differential housing is spherical in shape and the gears are readily accessible by a liberal sized plate. A large sized opening provides means for replenishing the supply of lubricant. Noticeable qualities of the components transmitting energy from the motor to the road wheels are simplicity of design and accessibility, features which will appeal to the motorist caring for his own car.

Liberal Sized Brakes.



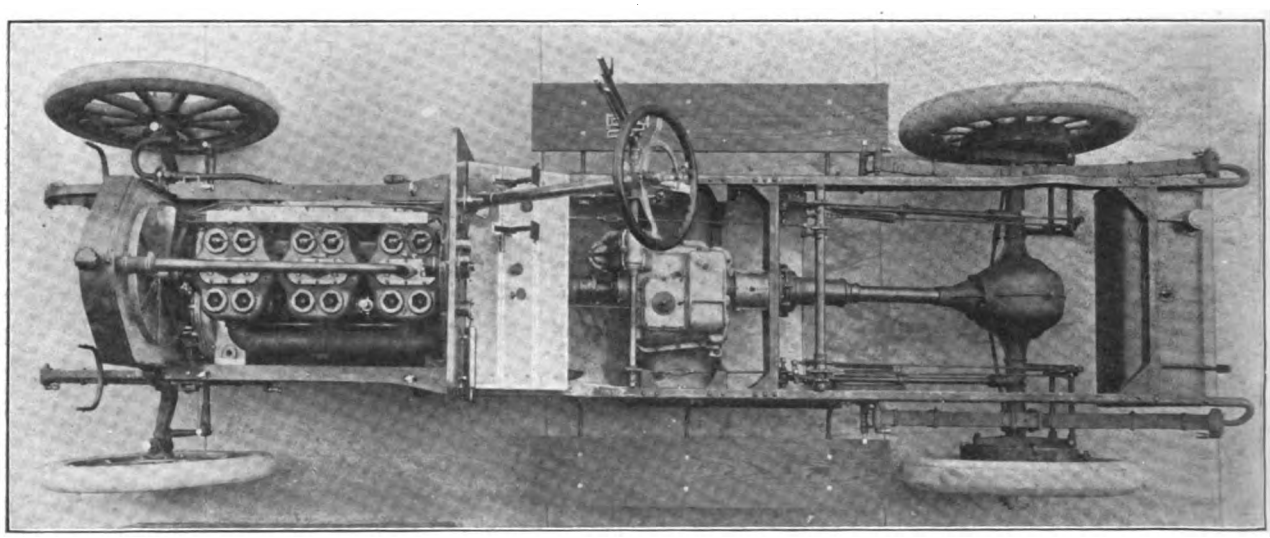
The policy of the company always has been to provide unusually large brakes and the new model is no exception. The brakes are 16 inches in diameter and the width of the drums insures efficiency. Both the service and emergency members are of the internal expanding type, the former being actuated by pedal and the emergency by a lever at the right of the driver.

The frame is of pressed steel of liberal dimensions and is reinforced by riveted cross members. Particular attention has been paid to the springs, these members being constructed of a high grade steel, ground and polished. The front members are semi-elliptic and three-quarter elliptic are fitted to the rear. The front axle is of the I beam section type, drop forged, and a noteworthy feature of construction is the sturdiness of the spindles. The tierod is located at the rear of the axle, eliminating possibility of damage through contact with road obstructions.

A high grade of wheel is employed and an attractive quality is that the wood is varnished and that the spokes are liberal in size. The rear wheels are secured to the flanges by a row of bolts, and to the brake drums by another series of bolts, through swelled sections of the spokes, a commendable design.

Inside Control Levers.

The steering mechanism is in keeping with the sturdy construction throughout and the steering post at the right is surmounted by a large sized corrugated hand wheel upon which are mounted the throttle and spark levers. The gear shift lever is located within the body at the right of the



Multiple Jet Carburetor, Standard Equipment with Both Palmer-Singer Chassis, Radiator Supports and Distributor of the Starting System.

driver and operates through an H gate carried on the side of the frame. This bracket also carries the emergency brake lever.

Digitized by Google

The wheelbase is 127 inches and the tread standard 56. The wheels are equipped with demountable rims and 36 by four-inch shoes are employed both front and rear. The fuel is fed to the carburetor by pressure feed on all models except the roadster on which gravity is employed, the unusually large gasoline tank being mounted immediately behind the seats. The design includes means for carrying an extra tire. The fuel tank of the pressure system is located at the rear of the chassis and pressure is maintained by the motor. All fuel pipes are of copper, securely cleated. The throttle may be operated by the lever on the hand wheel or by the accelerator, these members being interconnected.

The body designs are straight line and 10-inch upholstery is employed, making for easy riding qualities. The five-passenger body is standard. The runabout type presents attractive lines with its large fuel tank and seats located well to the rear of the chassis. The fenders are well designed and splash aprons are fitted to all models. On the roadster model provision is made for the tools, etc., by equipping the running board with a tool box. The equipment includes oil and gas lamps, Prest-O-Lite tank, horn, tools, etc.

Chassis of the Palmer-Singer 6-60 Which Will Be Continued with Minor Changes, Largely in the Nature of Refinements.

6-60 Chassis Details.

With the well known 6-60, six-cylinder chassis, the cylinders are cast in pairs, having a 4.875-inch bore and 5.5-inch stroke, and although rated at 57 horsepower by the S. A. E. formula, the motor, which is of the T head type, develops considerably in excess of this power. Dual ignition is provided by the Eisemann system and the high-tension magneto is located on the right of the motor. The ignition switch is provided with a locking device having a removable key.

The carburetor is a C. R. G. with three jets, these being surrounded by venturi tubes and controlled by a cam operated from the accelerator and lever on the steering wheel. A quality claimed of the carburetor is that upon being set at the factory it does not require further attention. A feature of the carburetion system of this chassis is the design of the intake manifold, it being free from bends and angles which tend to deflect and cause condensation of the mixture.

A multiple disc clutch is employed and unlike the Brighton Six the gearbox is located on two substantial cross members amidships. The torque head is of the spherical type, the drive being through a pair of close coupled universal joints to the tubular housed propeller shaft. The transmission is of the selective type, affording four speeds forward and reverse, and the control lever is mounted at the right, as is the emergency brake lever.

The rear axle is sturdily constructed and the differential housing is provided, as is the transmission casing, with liberal sized inspection plates, these also serving for replenishing the supply of lubricant. Heavy radius rods are employed, well anchored to the rear axle housing and cross frame bar.

The brakes are ample in size and are easily adjusted, the service member being actuated by pedal and the emergency by hand lever. The springs are semi-elliptic, both front and rear, and the same design of wheels are fitted as with the Brighton Six.

Digitized by Google

Fuel is supplied to the carburetor by pressure feed except on the roadster chassis, the vaporizer of which is fed by gravity, a 50-gallon capacity gasoline tank being mounted back of the seats. Provision is made for a liberal supply of oil.

The bodies fitted to the 6-60 chassis include a five and seven-passenger touring car and a roadster. The panels of the touring body are attractively curved and both designs are fitted with deep, luxurious, high grade upholstery. The equipment of these models is very complete and includes demountable rims.

Air Motor Starter.

An air motor starter has been adopted on both chassis, the pressure of the cylinders being utilized and stored in a tank located on the chassis near the muffler. On the intake side of each cylinder, horizontally located with regard to the combustion chamber, is inserted a small check valve having self-grinding conical seats. Pipes, neatly banked one above the other, are parallel with the bus bar. At the rear of the motor the tubes branch and lead in proper order to the air distributor, located at the extreme rear of the crankcase and mounted on a vertical shaft actuated by spiral gears driven by the intake camshaft.

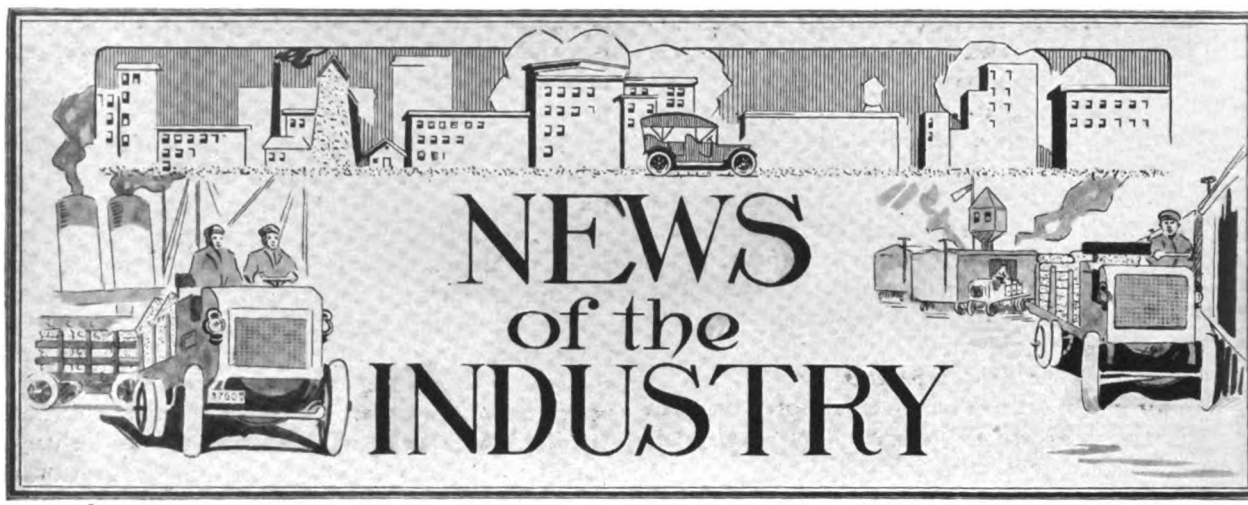
The distributing mechanism is simple, comprising a floating disc valve having a single port cut in its surface, which rotates concentrically and adjacent to an opposed port face from which the six equally spaced pressure leads to the cylinders are conducted. The compressed air enters the upper side of the floating disc and is distributed to the proper cylinder in the course of rotation by the uncovering of the proper port as the disc passes it.

The air is accumulated by means of an air-cooled check valve located in the exhaust cap of the rear cylinder, the valve being a tiny flanged cylinder, and provision for cooling is made. The valve proper consists of a conical seat at the entrance of the valve body and a piston like device is utilized for balancing purposes, and to provide liberal bearing surfaces and consequent wearing qualities. The pressure is led to the supply tank through the medium of a globe valve which prevents egress of the atmosphere.

It is conducted by an ample sized copper pipe to the footboard or starter valve which consists of a stem having at one end the operating button and at the other a mushroom head seating on a leather washer secured to the body of the valve. The outlet of this valve is directly connected to the distributor on its under side. The pressure is also utilized for the fuel system, a branch pipe leading to the gasoline tank and the dash is equipped with a pressure gauge. In this system is emphasized simplicity of operation, compactness and reliability.

Electric Lighting System.

The electric lighting equipment is the Dyneto system, comprising a dynamo which is located on the left hand side of the power plant on the forward arm of the crankcase support, and driven by a silent Morse chain actuated by a sprocket on the pump shaft. The generator provides a constant source of current for lighting and maintains the storage battery in a properly charged condition, this being utilized when the car is inoperative or the armature of the dynamo rotating at too slow a speed to produce a proper lighting voltage. The system also provides for ignition if desired. The speed of the dynamo is automatically controlled and a feature claimed of it is that it gives the battery a tapering charge.



A six-volt, 120 ampere-hour capacity battery is employed and this is located on the right hand footboard in a suitable container. The negative side of the circuit is fused with a 15-ampere cartridge fuse, neatly clipped to the inside of the dash, the function of the fuse being to prevent injury to the generator or lamps in the event of a short circuit.

A multiple switch, providing for any desired group of lamps, is incorporated as a unit with the ammeter on the dash, its function being to enable the driver to note easily the operation of the system, the dial being calibrated to show charge and discharge. The auxiliaries on the dash include, besides the lighting unit, two pressure gauges, the ignition switch and oil sight feed. Directly under the ignition switch and on the toeboard are two circular pedals, the air starter valve and cut-out.

DIFFICULT CANADIAN TRIP.

Thomas W. Wilby and F. V. Haney have sent word of their arrival at Nelson, British Columbia, after a transcontinental journey of 4000 miles in their Reo the Fifth, made by the Reo Motor Car Company, Lansing, Mich. Wilby and Haney left Halifax, N. S., Aug. 27 for Victoria, B. C., in search of an all-Canadian highway from coast to coast. The route lay through Truro, N. S.; Moncton, N. B.; St. John, Fredericton, Reviere-de-Loup, Quebec, Three Rivers, Montreal, Ottawa, Belleville, Toronto, Sudbury, Sault Ste. Marie, Port Arthur, Rat Portage, Winnipeg, Brandon, Regina, Medicine Hat, Alberta, Calgary and thence to Nelson and Victoria.

PROMOTING ELECTRIC VEHICLES.

New York Exposition Makes Possible Demonstration of Pleasure and Commercial Lines.

The exhibition of electric vehicles in connection with the New York electrical show, held at Grand Central Palace, Oct. 9-19, was one of the most comprehensive displays of such machines ever made in the metropolis. There were exhibits shown by 11 different concerns, four of which were of both pleasure cars and service wagons, two of pleasure carriages exclusively and there was also an exhibit of trucks intended for shop, factory, warehouse and shipping terminal service.

The total number of electric machines shown was about 45, of which 35 were exhibited at the stands and the others were seen within the enclosure and on the demonstration track on the upper balcony floor. Besides these displays several of the manufacturers of vehicle batteries demonstrated their products, and there were several exhibitions of devices for battery charging and current regulation especially adapted for garage equipment.

The show was inaugurated with a luncheon tendered to Thomas A. Edison by the New York Edison Company, this being an observance of the completion of 30 years of public service by that concern. Sept. 4, 1882, the first central station for the distribution of electric current commercially was placed in operation in Pearl street, New York, by Mr. Edison, whose ingenuity and skill made possible the practical utility of electric energy, and from this has been developed the use of electrical light, power and heat throughout the world. In recognition of Mr. Edison's wonderful achievements with electricity a company of about 400 of the most prominent citizens of the metropolis was gathered to congratulate the inventor, and he formally opened the exposition by turning on the current that lighted and operated the building and the exhibits it contained.

While the number of exhibitors was not large as measured by other vehicle exhibitions, the show was in every way representative and of unusual interest. The machines shown were types adapted for all classes of service, and while the pleasure vehicles were comparatively few, there was every evidence of the purposes for which the industrial wagons are especially adapted. In fact there appeared to be a desire by practically all of the exhibitors to emphasize the possibilities of electric service machines, and to impress upon the visitors the general purposes for which they are adapted.

The value of the electric carriage appears to have been very generally accepted by the public, and for this reason the manufacturers seek to establish the same recognition of the service wagons and trucks, basing expectation of business on the economy and endurance of these machines in all conditions of use. The demonstration track made it possible to show to all persons interested the vehicles in actual operation without leaving the building, and within the track was a charging panel that would charge four machines simultaneously, as well as other equipment such as would be necessary in a garage. This served to demonstrate to visitors the facilities required to install an electric service in connection with a business, and illustrated the simplicity and the character of the attention ordinarily needed. Not only this, the track demonstration permitted the instruction of buyers or their drivers in the operation of the vehicles.

Digitized by Google

As one of the results of the demonstrating thousands who were skeptical of the electric vehicle and who believed the motors and the batteries only practical in the hands of experts, were convinced that the machines were so simple that a good knowledge of driving was more useful than mechanical ability in general operation, and that with a reasonable system of attention admirable results could be obtained.

Of the exhibits shown the new Detroit clear vision brougham, which has a distinct body design; a new Baker brougham, and the new Buffalo coupe or limousine with wire wheels were the features of the passenger vehicles. The Detroit brougham body is constructed with an aluminum roof and curved glass replaces the curved wood corner sections at the rear, affording an unobstructed view of the highway at all sides. In this machine and the Baker brougham all of the passenger seats face forward. The wire wheels of the Buffalo coupe are furnished when desired.

The industrial machines, shown for the first time, included the Atlantic 3.5-ton truck and two-ton wagon, the Baker Motor Vehicle Company's 500-pound service runabout, the service runabout of S. R. Bailey & Son, Inc., the 1000-pound shaft driven and the 2000-pound chain driven wagons of the Champion Electric Vehicle Company, the five-ton truck chassis of the General Motors Truck Company, and a Studebaker two-ton wagon. The other machines were of standard design. The exhibitors and their displays follow:

Anderson Electric Car Company, Detroit—Passenger roadster, coupe, victoria limousine and brougham, and service wagon chassis of 1000, 2000 and 3000 pounds capacity.

Atlantic Vehicle Company, Newark, N. J.—One-ton wagon chassis and a 3.5-ton truck chassis, the latter demonstrated on the track.

Baker Motor Vehicle Company, Cleveland, O.—Wheel steered brougham, coupe, victoria and 500-pound service runabout and two-ton wagon chassis.

S. R. Bailey & Son, Inc., Amesbury, Mass.—A 500-pound capacity service runabout.

Buffalo Electric Vehicle Company, Buffalo, N. Y.—Passenger victoria and two coupes.

Champion Electric Vehicle Company, Oswego, N. Y.—A 1000-pound shaft driven delivery wagon with panel body and one-ton chain driven delivery wagon.

Cleveland-Gallon Motor Truck Company, Cleveland, O.—Two dynamic industrial trucks, driven and steered with all four wheels of one ton capacity each.

General Motors Truck Company, Pontiac, Mich.—Five-ton truck chassis.

General Vehicle Company, Long Island City, N. Y.—Two 750-pound delivery wagons on the track, a 1000-pound delivery wagon, a 3.5-ton truck on the track and one-ton industrial truck.

Lansden Company, Newark, N. J.—One-ton wagon chassis, two-ton chassis and a 3.5-ton truck chassis.

Studebaker Corporation, South Bend, Ind.—A 1000-pound delivery wagon chassis, a 1913 two-ton wagon chassis and a five-ton truck loaned by George Ehret, fitted with a brewery delivery body designed by Louis Ehret.

Ward Motor Vehicle Company, New York City—A 1000-pound baker's delivery wagon, and one-ton wagon loaned by the Edison Electric Illuminating Company of Brooklyn.

Exhibitions of batteries and battery components were made by the Edison Storage Battery Company, Orange, N. J.; the Electric Storage Battery Company, Philadelphia, Penn.; the Gould Storage Battery Company, New York City, and the Philadelphia Storage Battery Company, Philadelphia, Penn.

LATEST REORGANIZATION PLAN.

Stockholders of United States Motor Company to Be Assessed $24 a Share.

Although several plans for reorganizing the United States Motor Company, New York City, which went into the hands of receivers Sept. 11, have been published during the past month, it is understood that none of them met with unqualified indorsement by all interested parties. The latest announcement respecting the situation is that an assessment of $24 a share is to be made upon the preferred and common stock of the parent organization, and on the preferred and common stock of the Columbia Motor Car Company, Hartford, Conn., one of its subsidiaries. It is understood now that the total capitalization will be scaled down as follows:

For and in consideration of the $24 assessment, the new company will issue in exchange for the preferred certificates 24 per cent. of new first preferred, 25 per cent. of the second preferred and 30 per cent. of common. For the common certificates outstanding, on payment of an assessment of $24 a share, the new company will issue 24 per cent. of first preferred, 17.5 per cent. of second preferred and 30 per cent. of common. This assessment means that the new company will start out with a clear capital for working operations of about $3,000,000. It is proposed to raise by this method the sum of $5,720,000. The remainder will be used for funding the matured obligations.

At this time there is still remaining in the treasury of the company the sum of $1,000,000. The distribution of this fund was one of the chief matters of contention in the deliberations of the merchandise creditors. It is understood that a compromise has been reached, whereby these creditors will receive 25 per cent. of their claims in cash, 25 per cent. in first preferred, 25 per cent. in second preferred, and 15 per cent. in common, thus making a settlement of approximately 90 cents on a dollar.

All first and second preferred stock of the new company and all common stock other than shares reserved to qualify directors is to be vested for a

Digitized by Google

term of not exceeding five years in Charles H. Sabin, Harry Bronner and James C. Brady, and their successors as voting trustees, and voting trust certificates in such form as may be determined by the committee will be distributed in lieu of stock. Voting trust certificates are intended to be distributed to creditors and stockholders participating in this plan substantially as follows:

First Preferred Stock.

To depositing holders of debenture bonds and bond scrip (50%)	$3,080,755
To depositing holders of claims against the Motor company only (25%)	475,906
To depositing stockholders of the Motor company and of the Columbia company duly paying the assessments hereinafter provided for:	
Preferred stockholders (24%)	2,763,152
Common stockholders (24%)	2,957,844
Total	$9,277,657

Second Preferred Stock.

To depositing holders of debenture bonds and bond scrip (50%)	$3,080,755
To depositing holders of claims against Motor company only (25%)	475,906
To depositing stockholders of the Motor company and of the Columbia company duly paying the assessments hereinafter provided for:	
Preferred stockholders (25%)	2,878,283
Common stockholders (17½%)	2,156,761
Total	$8,591,705

Common Stock.

To depositing holders of debenture bonds and bond scrip (40%)	$2,464,604
To depositing holders of claims against Motor company only (15%)	285,543
To depositing stockholders of the Motor company and of the Columbia company duly paying the assessments hereinafter provided for:	
Preferred stockholders (30%)	3,453,940
Common stockholders (30%)	3,697,305
Total	$9,901,392

In connection with this situation, it is announced that Benjamin Briscoe has resigned as president of the company, although he will remain in office until the middle of November. He retains his interest in the concern, however.

WILL INSURE AUTOMOBILES.

Two New York Concerns Formed to Carry on All Phases of Business.

The National Motor Indemnity Company and the National Motor Insurance Company of New York City are being organized by interests with which President William B. Joyce of the National Surety Company of that city is identified and will soon be incorporated under the laws of New York state. The former concern is formed for insuring automobiles against loss or damage in every form except loss by fire. It will have a capital of $800,000 and surplus of $400,000. The Motor Insurance Company will insure automobiles against fire and explosion. It will have a capital of $500,000 and a surplus of $250,000. The ownership and management of the two companies will be identical. It is planned to keep down agency expenses by selling policies through automobile manufacturers and dealers.

William B. Joyce will be chairman of the executive committee of the new companies. The first board of directors will consist of the following: William B. Joyce, James C. Colgate, William A. Tucker, Franklin Q. Brown, Alexander M. White, Charles M. Sabin, Henry E. Cooper, H. C. Wright, William A. Gaston, Eugene V. R. Thayer, William E. Metzer, A. G. Batchelder, Hugh Chalmers, Thomas Henderson, Albert C. Pope, Alfred Reeves, S. A. Miles, Winfred J. Foss, E. B. Jackson, A. E. Maltby, Ernest H. Greenwood, George W. Hipple, W. P. Berrien and Chester I. Campbell.

ATLAS ENGINE WORKS SOLD.

Lyons-Atlas Company Is Purchaser and Plant Will Resume Work on Large Scale.

The Atlas Engine Works of Indianapolis, has been purchased by the Lyons-Atlas Company, which has been incorporated with a capital stock of $500,000, all paid in. The concern will take possession of the plant, which covers 67 acres, at once and will begin the manufacture of Knight engines for the trade. The Atlas Engine Works was ordered sold by Judge Weir of the superior court and was in the hands of a receiver for 3.5 months. The Lyons-Atlas Company, which made the successful bid, is composed of experienced Chicago men who have been engaged in the manufacturing business. The president, James W. Lyons, and the vice president, William F. Lyons, were connected with the Atlas Engine Works about 20 years ago. George W. Lyons is secretary and treasurer.

Under the provisions of the bid the new company will pay $441,000, the interest on the $1,050,000 in bonds, secured by a mortgage deed of trust held by the Indiana Trust Company; $105,000, a certain indebtedness secured by $150,000 in bonds; $48,187.04, a debt which is secured by $63,000 in bills and accounts receivable, and $80,000 in cash. Two judgments against the Atlas Engine Works, aggregating $6700 will also be paid. The company will take over the real estate and buildings subject to the mortgage deed of

Digitized by Google

trust, but the personal property must be paid for in cash. In addition to the manufacture of Knight engines it will continue the production of the Diesel engine and will employ from 2000 to 3000 men.

BUY PEERLESS STOCK.

National Electric Lamp Men Now Powerful Factors in Affairs of the Concern.

Five of the men most influential in the National Electric Lamp Company, Cleveland, O., a branch of the General Electric Company, have purchased substantial blocks of stock in the Peerless Motor Car Company, Cleveland, O., maker of Peerless pleasure and commercial cars. They are H. A. Tremaine, B. G. Tremaine, J. B. Crouse, J. R. Crouse and F. S. Terry and they now form a powerful factor in the affairs of the automobile manufacturing concern.

Between the corporations as such there will be no alliance, but the experience and connections of the lamp men will furnish important impetus to development of the Peerless company's business. The latter concern owns 20 acres of property in Cleveland and the ground and nine-story building on Broadway, New York City, besides its allied distributing companies in a number of states.

The concern within the year has sold $1,100,000 in 6 per cent. bonds and $300,000 in stock and is about to issue $1,100,000 additional stock, it is said, making its total stock capitalization $3,000,000. The officers are: President, L. H. Kittredge; vice president, E. H. Parkhurst; treasurer, F. I. Harding; secretary, George B. Siddall. W. H. Staring, L. H. Treadway, A. B. McNairy, Samuel Scovil and C. E. Sullivan constitute the board of directors and it is believed that representatives of the National Electric Lamp Company will shortly be elected to the board.

MACNAB JOINS MARION.

Well Known Sales Manager Becomes Vice President of Indianapolis Motor Car Concern.

M. D. MacNab of Chicago, a prominent figure in the automobile industry, has joined the executive force of the Marion Motor Car Company, Indianapolis, Ind., maker of the Marion cars. The announcement came as one of the most interesting developments in the motor car trade in some time. Mr. MacNab has resigned as general manager of the United Motor Chicago Company and now becomes vice president of the Marion company.

As director of sales he will at once enlarge the interests which he has had in automobile distribution. For three years Mr. MacNab has been guiding the general sales of the Maxwell and Columbia cars over a wide territory and brings to the Marion a fund of valuable knowledge of sales conditions.

IS NEW FEDERAL EXECUTIVE.

Garvin Denby Appointed Secretary and Treasurer with Charge of Sales Department.

Garvin Denby, prominent in business circles in Detroit and the East, has been added to the executive staff of the Federal Motor Truck Company, Detroit, maker of Federal trucks, his position being secretary and treasurer with general charge over the sales department. Mr. Denby is a salesman of proven ability and has achieved success in many past undertakings. His business career began in 1897 when he started with the Gilbert Wilkes Company of Detroit, in the electrical and mechanical engineering department. He passed two very successful years with this concern until the spring of 1899, when he was appointed attache of the first Philippine commission under Chairman Schurman, spending a year in the Insular possessions.

Garvin Denby, Secretary Federal Motor Truck Company.

Mr. Denby left the government service in 1900, joining the forces of the Solvay Process Company of Detroit. He was appointed assistant in the soda ash department, where he was successful, being transferred in 1907 to the head offices at Syracuse, N. Y. His past excellent record resulted in his appointment as assistant to the president, which position he occupied until going with the Federal Motor Truck Company.

REID WITH GRINNELL ELECTRIC.

Well Known Selling Agent Becomes Sales Manager of Prominent Detroit Concern.

The many friends of Theodore C. Reid of Jackson, Mich., will be glad to learn of his appointment as manager of the sales division of the Grinnell Electric Car Company, Detroit, maker of Grinnell electric vehicles. Mr. Reid brings to his new position a wealth of information concerning modern methods of salesmanship, and as he is throughly convinced of the practicability of the electric car, there is little doubt that his new connection will prove as successful as his past record would seem to warrant.

For the past few years Mr. Reid has been identified with one of the most enterprising and systematic selling organizations in Chicago. His insight into selling methods was obtained through a very broad and thorough experience in several lines, and this led the Grinnell company to select him from a large number of prospective sales managers. There is every reason for believing that he will add material strength to the Grinnell organization.

T. C. Reid, Sales Manager Grinnell Electric Car Company.

KING COMPANY CHANGES.

Management Announces Entirely New Organization of Men with Wide Experience.

The King Motor Car Company, Detroit, maker of King automobiles, which was recently purchased by Artemas Ward of New York City, has been placed upon a strong financial basis and is in charge of an entirely new organization of men who have had wide experience in the motor car industry. Operations have been started in the factory turning out the new 1913 models, which consist of a roadster, touring car and coupe. The management is under the direction of J. G. Bayerline, formerly connected with Pope-Toledo, Pope-Hartford, Olds Motor Works and Hudson Motor Car Company. For the past three years he was vice president and general manager of the Warren Motor Car Company, Detroit, maker of Warren pleasure and commercial cars. T. A. Bollinger will be factory manager. The new concern will protect all guarantees issued by the old company and a full supply of repair parts will be carried at all times.

INCREASES CAPITAL STOCK.

Federal Rubber Manufacturing Company Adds Floor Space and Provides for Future Growth.

The Federal Rubber Manufacturing Company, Milwaukee, Wis., has filed with the secretary of state amendments to its articles of association increasing its capital stock from $1,000,000 to $2,000,000, the increase consisting of 7 per cent. preferred stock, redeemable at 120.

Additional buildings and other improvements are under way, including a new power plant aggregating 3500 horsepower and a further addition to the office building. The total expenditure for improvements will represent approximately $500,000 giving the company about 250,000 square feet of floor space, providing employment for between 1000 and 2000 men and representing an annual output of about $5,000,000.

WILL REMOVE PLANT.

New Jersey Maker of Automobile Tire Pumps Will Transfer Business to Connecticut.

C. H. Newton, Newark, N. J., a manufacturer of wide experience, who has been engaged in the production of a new automobile pump, has become connected with Osborne-Stephenson Company, Plainville, Conn., manufacturer of special hardware, and will be associated in future with F. G. Stephenson in the management of the concern.

Mr. Newton will give up his plant at Newark and move his machinery to Plainville, where it will be installed in the Osborne-Stephenson factory. The consolidation will mean a big increase in business and it is expected that not only will it result in the employment of additional men, but in the near future the factory probably will be enlarged. Mr. Newton will be manager.

SAFEGUARDS LBA PRODUCTION.

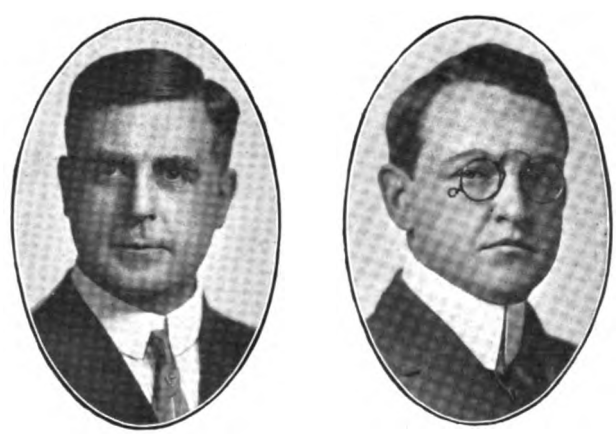
Willard Storage Battery Company Purchases Additional Factory in Cleveland, O.

The Willard Storage Battery Company, Cleveland, O., maker of the well known LBA lighting and starting batteries, has purchased the real estate and three-story brick and stone building on Lakeside avenue, formerly occupied by the Frost Wire Fence Company. This gives an additional 50,000 square feet of floor space admirably adapted to its use, both on account of its arrangement and its close proximity to its No. 1 plant. Equipment of the new factory already is far advanced and a portion of it will be occupied at once for the production of every separate detail in storage battery construction.

The acquisition of this property, to be known as plant No. 3, gives the company three separate and distinct factories, all of large capacity, each one of which is furnished with all necessary equipment for operating independently of the others. It is understood that the purchase was made for two reasons—that of assuring its production against the possibility of interruption in case of fire and of affording ample room for expansion.

NEW RUBBER CONCERN.

Well Known Polack Tire & Rubber Company of Germany Starts Factory at Bridgeport.



The Polack Tire & Rubber Company, Waterhausen, Germany, with branches at Sydney, Australia; London and Paris, is expected to locate a factory at Bridgeport, Conn., for the manufacture of its product, the Polack solid rubber tire for motor vehicles. The concern has secured a building owned by the Bridgeport Copper Company, which is being remodelled to receive the heavy machinery necessary for the work. This will be installed immediately after its shipment from Trenton, N. J., where such machinery is made.

Herman W. Polack, grandson of the founder of the German company, B. Polack, will be vice president of the American concern and is said to anticipate having the factory in operation in the near future. The German company was organized in 1863 and grew gradually until the advent of the motor car industry, since which time it has found a market all over the world for its rubber tires. President Polack, father of Vice President Polack of the American company, is expected in this country within a few days to supervise the founding of the new plant.

PROMOTION FOR COLE MEN.

Several Changes in Personnel Follow Resignation of Sales Manager Henderson.

Following the resignation of R. P. Henderson as general sales manager of the Cole Motor Car Company, Indianapolis, Ind., comes the announcement of a rearrangement of department heads, as a result of which Homer McKee, for some time director of the Cole advertising policy, becomes in addition, assistant to President J. J. Cole. In conjunction with the president, Mr. McKee will have jurisdiction over the sales and advertising departments. Secretary-Treasurer J. Frank Morrison has been given executive command over the sales office force, and will be assisted in his financial work by John Murphy and Barton Wright.

With Cole Motor Car Company: At Left, J. Frank Morrison, Secretary-Treasurer; at Right, Homer McKee, Assistant to President.

The new Cole sales policy, which was made known last month, calls for the appointment of five district sales managers, each of whom acts with the authority of a general sales manager in his respective territory. These are J. R. Moler, C. J. Corkhill, G. H. Strout, E. C. Frady and W. L. Colt. It would appear that these five men were to act in co-operation with Mr. McKee in carrying out the sales plans promulgated by President Cole, and that the arrangement will result in a decided success seems evident from the reputation gained by Mr. McKee while directing the advertising policy of the Cole Motor Car Company.

DECLARES STOCK DIVIDEND.

McGraw Tire & Rubber Company Has Successful Year with Its Imperial Tires.

At the regular October meeting of the board of directors of the McGraw Tire & Rubber Company, East Palestine, O., maker of Imperial tires and tubes, it was unanimously voted to increase the capital stock from $100,000 to $250,000. Acting upon the very favorable report of President E. C. McGraw concerning the past year's business, the directors voted a stock dividend of 50 per cent. plus a cash dividend of 10 per cent.

The concern has made several important additions to its plant during 1912, including the building of a laboratory, which is held to be second to none among the rubber companies of America. In an effort to supply the needs of the eastern market a large selling branch recently was located at 1706 Broadway, New York City.

Partial View of the Pleasure Car Section in the Open Air Show Held by St. Louis Dealers.

ST. LOUIS OPENS SHOW SEASON.

Sixth Annual Dealers' Display Held Out of Doors at Forest Park Highlands.

Following the plan adopted last year, the St. Louis Automobile Dealers' Association held its sixth annual show in the open air at Forest Park Highlands in that city. This was the first display of the 1913 models in the country, and as such attracted unusual attention among the people of the Middle West and Southwest. The display was begun Oct. 7 and continued until Oct. 14. The exhibitors follow:

Gasoline Pleasure Cars—Geo. C. Brinkmann Motor Car Company, Nyberg, National; M. W. Bond Automobile Company, Little Four, Glide; Brown Automobile Company Peerless, Detroiter, Rayfield; Dorris Motor Car Company, Dorris; Igou Motor Car Company, Bergdoll; Moon Motor Car Company, Moon; Bagnell Automobile Company, Lozier; Hudson-Phillips Automobile Company, Hudson; Ford Motor Car Company, Ford; Grand Motor Car Company, Regal; Western Automobile Company, Pierce-Arrow; Johnson Automobile Company, Moline, Empire; United Motors St. Louis Company, Maxwell, Columbia; Halsey Automobile Company, Packard; White Motor Car Company, White; Swartz Automobile Company, Velie; Lane-Lynch Motor Car Company, Stutz; Kardell Motor Car Company, Reo; South Side Automobile Company, Matheson; Oldsmobile Company of Missouri, Oldsmobile; Colonial Automobile Company, Flanders; J. I. Case Threshing Machine Company, Case; Lindsay Motor Car Company, Premier, Paige-Detroit, Fiat, Haynes; Missouri Motor Car Company, Marmon, Alco, Abbott-Detroit; Oakland Automobile Company, Oakland; Mound City Buggy Company, Jackson; Heinrichs Automobile Company, Michigan; Burns Ramsden Motor Car Company, Rambler; Locomobile Company of America, Locomobile; Weber Implement & Automobile Company, Mitchell, R-C-H; Buick Motor Company, Buick; Studebaker Corporation of America, Studebaker; Model Auto & Sales Company, Henderson; Warren Automobile Company, Warren; St. Louis Stearns Automobile Company, Stearns; Meyer-Busch Automobile Company, Speedwell; Overland Automobile Company, Overland; Cadillac Motor Sales Company, Cadillac.

Electric Pleasure Cars—Union Electric Light & Power Company, Rauch & Lang; Park Automobile Company, Baker; Woods Motor Vehicle Company, Woods; Priestmeyer-Stevens Automobile Company, Waverley; Borland Grannis Company, Borland; Ralph C. Jones, Hupp-Yeats; Colonial Automobile Company, Flanders; Smith Automobile & Battery Company, Ohio; Detroit Electric Car Company, Detroit; Warren Automobile Company, Standard.

Commercial Cars — George C. Brinkmann, Wilcox; Missouri Motor Car Company, Alco; Brooks-Lata Automobile Company, Brooks-Lata; Cochrane Motor Sales Company, Gramm, Modern; Federal Truck Company, Federal; International Harvester Company, International; Jos. W. Moon Buggy Company, Moon; Poss Motor Truck Company, Poss; Lindsay Motor Car Company, Universal; Halsey Automobile Company, Packard; Western Automobile Company, Pierce-Arrow; Dorris Motor Car Company, Dorris; Ford Motor Car Company, Ford; White Motor Car Company, White; Brown Automobile Company, Peerless; Buick Motor Company, Buick; Locomobile Company of America, Locomobile; Mack Motor Truck Company, Mack; Union Electric Light & Power Company, G. V. Electric; Meyer-Busch Automobile Company, Speedwell; Standard Automobile Company, Commerce.

READY FOR BUSINESS.

Croxton Concern Practically Completes Its Removal from Cleveland to Washington, Penn.

The Croxton Automobile Company, formerly of Cleveland, now of Washington, Penn., has its new plant in the latter city practically ready for occupancy. Six carloads of machinery from the Cleveland plant, which has been almost completely dismantled, have been received at Washington and new machinery will be added to the old

Digitized by Google

equipment, giving the company facilities to manufacture 1000 cars annually. The concern has expended $40,000 on the new factory, which is a three-bay building, each bay being 40 feet wide, requiring 500 tons of structural steel in its construction.

The Croxton company is capitalized at $300,000 and Washington and Pittsburg, Penn., capitalists are interested. The concern has been manufacturing taxicabs, touring cars and trucks and has built up a large business. J. P. Stolz, Cleveland, will retain the presidency, and the members of the board of directors, in addition to Mr. Stolz are: James I. Bronson, John H. Donnan, I. D. Bigger, A. C. Warne, C. S. Caldwell, G. W. Dunderer and A. M. Linn.

KNOX COMPANY ASSIGNS.

Expected That Trustees Will Carry Concern Safely Through Financial Difficulties.

The Knox Automobile Company, Springfield, Mass., maker of the Knox pleasure and commercial vehicles, and one of the largest automobile concerns in the country, has made an assignment to Edward O. Sutton of Springfield, and Harry G. Fisk, treasurer of the Fisk Rubber Company, Chicopee Falls, Mass., maker of the Fisk tires, both of whom represent the largest creditors of the concern, to whom the Knox company is indebted to about $1,250,000.

At the first meeting of the stockholders after the assignment was announced, which took the form of an annual meeting, a proposition from outside capitalists to purchase the plant and change its name to the Knox Motor Car Company was considered. However, without a dissenting voice the company voted to continue the business and reorganize at once. Judge T. Z. Lee of Providence, R. I., J. J. Shaughnessy, president of the Marlboro National Bank, Marlboro, Mass., and Charles C. Lewis of Springfield, Mass., were appointed a committee to draw up a plan of organization. At a second meeting it was voted to continue the committee in power for future operation, there being 6995 shares of stock represented at the meeting. The following officers were elected: President, William E. Wright; vice president, Harry G. Fisk; treasurer, A. E. Smith; clerk, C. H. Beckwith; directors, former board re-elected, with the addition of Edward O. Sutton and Harry G. Fisk; executive committee, Peter Murray, William E. Wright and Edward O. Sutton.

WILLYS DROPS SUIT.

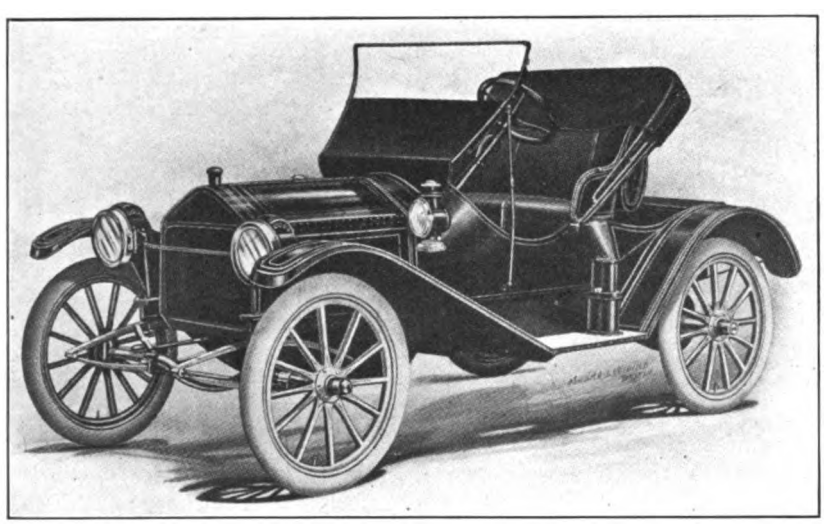
Effects Satisfactory Arrangement with Gramm Officials Which Prevents Court Action.

The suit brought about two months ago by John N. Willys, president of the Willys-Overland Company, against A. K. White and W. T. Agerter, former president and treasurer, respectively, of the Gramm Motor Truck Company, Lima, O., has been settled out of court, according to an announcement from Toledo, O.

Mr. Willys alleged in his complaint that the values shown in the statements under which he purchased the stock of the Gramm Motor Truck Company from White and Agerter, were not correctly represented, and sued for a rescindment of the purchase contract. The matter has been settled by a readjustment of values, which, by his consent to a withdrawal of the suit, are apparently satisfactory to Mr. Willys.

ENTERS TIRE FIELD.

New Patterson Rubber Company to Erect Five Buildings at Lowell, Mass.



The Patterson Rubber Company is the name of a new Massachusetts corporation just formed with a capital stock of $500,000, with its headquarters at Lowell, Mass. Five buildings will be erected on Middlesex street, Lowell, for the production of solid and pneumatic tires and inner tubes. In addition, mechanical rubber goods and many subsidiary lines will be manufactured.

John S. Patterson of Providence, R. I., is president of the company; Capt. Francis H. Appleton of Brookline, Mass., is treasurer; James M. Patterson, son of John S. Patterson, is vice president, and Francis H. Appleton, Jr., of Franklin, Mass., is clerk. Mr. Appleton, Sr., is a successful manufacturer of reclaimed rubber, with a factory at Franklin, and James M. Patterson has for the past 18 years been factory manager of the Providence plant of the Revere Rubber Company. Mr. Patterson and his father will take with them to Lowell from Providence, to similar positions, Walter F. Macdonald, assistant factory manager; Frank Chamberlain, factory superintendent; Charles H. O'Neill, mechanical engineer, and Arthur Carr, superintendent of a subsidiary department. The officers of the new concern, with George F. Singleton of Franklin, will be directors of the company.

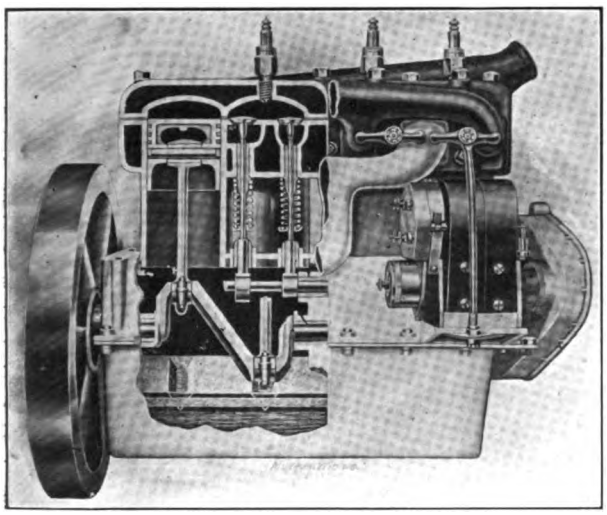
Digitized by Google

METZ FRICTION DRIVEN ROADSTER.

COMBINING the well known Metz friction transmission with new and interesting features which are expected to make a special appeal to those who desire a small car with plenty of reserve power and hill climbing ability, the Metz Company, Waltham, Mass., announces a new 22 horsepower roadster for the 1913 season. It should be stated that 95 per cent. of the parts, including the motor, transmission and the entire chassis, body, seat, top, windshield and practically every fitting, with the exception of the tires, magneto and carburetor, is made in the Metz factory. Every car must be able to climb Prospect hill, one of the highest points of land in the vicinity of Boston, with a grade reported by the city engineer as varying from 5 to 21 per cent. and nearly a mile in length, on the high speed.

The Metz 22 Horsepower, Friction Driven Roadster for the 1913 Season.

The motor is a four-cylinder, water-cooled unit, with cylinders cast en bloc and with bore of 3.75 inches and stroke of four, giving a standard rating of 22.5 horsepower. The construction is with removable water jacketed cylinder head, permitting free access to the combustion chamber, pistons and valves. The crankshaft is made of the highest grade steel, specially heat treated to insure the greatest degree of strength and toughness, and has three main bearings of liberal dimensions, these being of superior bearing metal and with long bearing surfaces.



The lower half of the crankcase constitutes the oil reservoir, lubrication being by the constant level splash system, a positively driven pump distributing the lubricant to pockets directly beneath each connecting rod. The valves, pushrods and springs are completely enclosed, making for noiseless action and excluding road dust and grit.

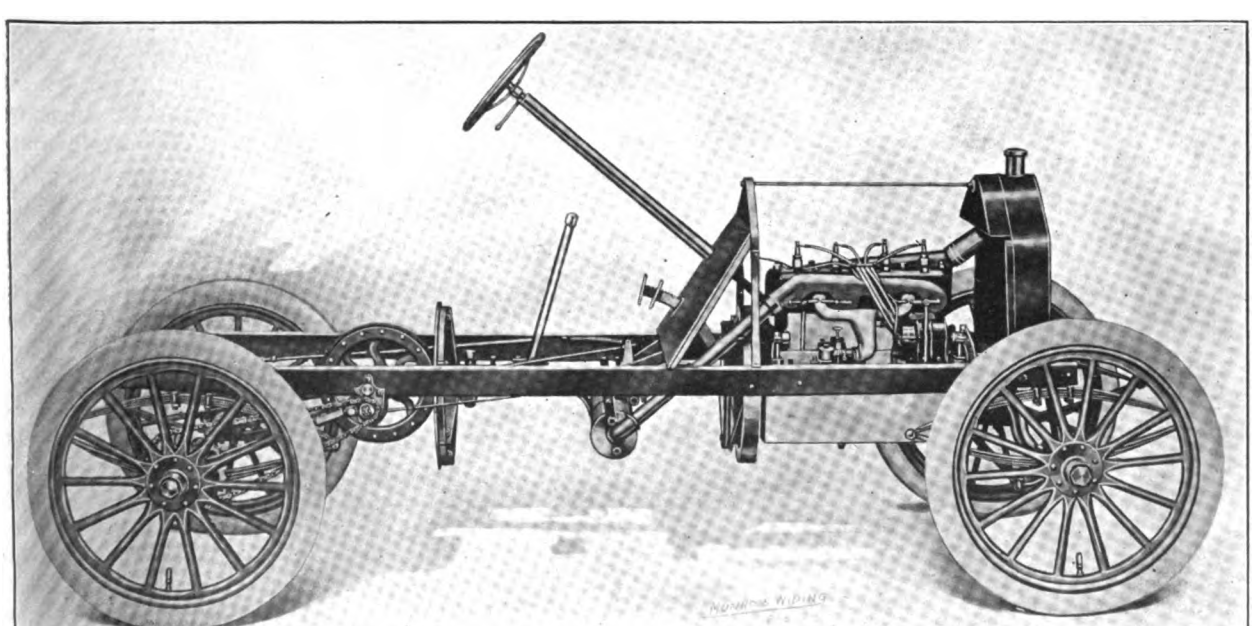
Cooling is by the thermo-syphon system, the water being forced up through the cylinder water jackets and thence to the vertical tube radiator of large dimensions, insuring proper cooling under all conditions of service. The fuel is carried in the military tank attached to the back of the seat, whence it flows to the automatic float feed carburetor by gravity. Ignition is by a Bosch true high-tension magneto, and both the magneto and carburetor are placed in accessible positions.

The friction transmission is described as simple in design and construction, and particularly accessible. The forward end of the shaft attached to the flywheel may be reached without removing the engine pan, while the disc and fibre wheel are protected by a removable pan. The drive is completely enclosed and the chains run in oil. The friction rim is composed of compressed fibre, a material which possesses maximum adhesion when employed with the driving plate of special alloy. An improvement is noted in that a two-piece ring is dowelled together so as to form one complete ring, and should renewal prove necessary it is held to be a simple matter to replace the rim by separating the new ring, removing the dowel pins, placing it on the friction wheel and tightening up the bolts. The propeller shaft from the engine to the fibre disc is run on large ball bearings, and forms a straight line drive from the motor to the jackshaft. Final drive is by chains to the rear sprockets.

Springs are full elliptic, heat treated and carefully selected as to tension and weight. Wheels are of the standard artillery type, equipped with clincher tires, 30 by three inches. Expanding brake drums are fitted to the rear wheels, and in addition the friction wheel may be utilized as a brake when applied in reverse. The control lever is placed in the centre, a departure from previous practise, and an arrangement making for more easy entrance and egress, particularly as the

Digitized by Google

Sectional View of Metz 22 Horsepower, Four-Cylinder Motor.



driver is located at the left, with its attendant advantages. The lever is of steel tubing with a cap on top, which when pressed down permits of shifting to any speed desired. Pedals also form a part of the controlling mechanism, one operating the brake and the other the clutch. The throttle controlling lever is on the steering column.

The body is finished in dark blue with cream wheels, and all lamps and accessories are in rich black enamel. The body itself is of metal, mounted on wooden framework, and the seat is neatly upholstered. The space between the seat and enclosure is such as to permit entrance and egress with the utmost ease, the design being of the semi-enclosed type, a modification of the fore door. In the rear there is a compartment for tools and supplies, so constructed as to form a base for a rumble seat.

The top is so arranged that when it is not in use it may be employed as a dust shield. The bow brackets are carried by auxiliary brackets at the lower extremities of the seat rail, thus supporting the top, which is encased in a neat slip, in a sightly as well as useful position. The windshield is constructed of a material to match the top, and is mounted on a deflective frame fitted to the enclosure. Removable side curtains may be fastened to the side of the seat and to the windshield in a manner to completely protect the occupants of the car. The other equipment includes gas lamps, generator, horn, tire pump and full set of tools.

TESTING NEW SUBURBAN.

The Suburban Motor Company, Detroit, is testing its first finished car. The machine has been sent out on a long trip through Huron county, Michigan, and will receive hard night and day driving for at least two weeks. The new factory of the Suburban company is nearing completion and will soon be ready for occupancy.

ACCESSORY EXHIBITORS AT COMING SHOWS.

EIGHTEEN new members were elected at the recent meeting of the Motor & Accessory Manufacturers in New York City, at which time allotment of spaces for the New York, Chicago and Boston shows also was made. The new members follow:

Bijur Motor Lighting Company, 250 West 54th street, New York City, electric generators; Endurance Tire & Rubber Company, 1789 Broadway, New York City, inner tubes; Edward G. Budd Manufacturing Company, 807 North American building, Philadelphia, steel bodies; Brown & Sharpe Manufacturing Company, Providence, R. I., gears and transmissions; Hartford Machine Screw Company, Hartford, Conn., spark plugs, automatic pumps, etc.; Simms Magneto Company, 1780 Broadway, New York City, magnetos, carburetors and plugs; Ignition Starter Company, 264-268 Jefferson avenue, Detroit, starting systems; Walpole Rubber Company, 757 Boylston street, Boston, Mass., tires and tubes; New Jersey Car Spring & Rubber Company, Wayne and Brunswick streets, Jersey City, N. J., tires and tubes; Hess Steel Castings Company, Bridgeton, N. J., wrought iron and steel castings; Schoen-Jackson Company, Medina, Penn., carburetors; Gould Storage Battery Company, 347 Fifth avenue, New York City, storage batteries; New Miller Carburetor Company, 512 North Capitol avenue, Indianapolis, Ind., carburetors; Marathon Tire & Rubber Company, Cuyahoga Falls, N. Y., tires and tire accessories; Electric Auto-Lite Company, 133 Michigan avenue, Toledo, O., lighting and starting systems; Baldwin Steel Company, 30 Church street, New York City, steel castings; Pittsburg Model Engine Company, Pittsburg, Penn., engines, transmissions and clutches; Garage Equipment Company, 742-748 South Pierce street, Milwaukee, Wis., automobile accessories.

The allotment of spaces shows that members will exhibit at Madison Square Garden and Grand Central Palace in New York, the Coliseum in Chicago and Mechanics' building in Boston according to the following table, this also indicating the weeks at which displays will be made at each show and the principal articles manufactured by each concern:

KISSELKAR LINE IS VARIED.

The Kissel Motor Car Company, Hartford, Wis., maker of KisselKar pleasure and commercial vehicles, claims to manufacture the most varied line of motor cars in America if not in the world. In pleasure cars it makes 30, 40, 50 and 60 horsepower chassis with touring, coupe and limousine bodies. A 1500-pound light delivery wagon and trucks of one, two, three, four and five tons capacity are also built by this company.

WORLD TOURING HUPMOBILE.

Joseph R. Drake, treasurer of the Hupp Motor Car Company, Detroit, maker of the Hupmobile, who last year completed a trip around the world in a car of this make, has started on a second and more comprehensive journey in a 1913 model with specially constructed body. While the trip has an aspect of pleasure, it is also for business, as acquaintances made before will be renewed.

On his former journey he started westward. On the present tour he will sail from New York to England and after touring Scotland and England he will visit the Olympia automobile show at London and then tour the principal cities of Europe. From Europe the route will be by boat to India, where Mr. Drake plans to land early in December. He will then visit China, Japan, the Philippines, Australia and New Zealand.

NEW HIGHWAY TO JERSEY COAST.

State Road Commissioner Stevens of New Jersey has approved specifications for the Burlington county end of the gravel road which is to be built from Brown's Mills to Lakehurst, thus completing the shortest route across the state from Philadelphia to the New Jersey coast resorts. After this highway has been finished practically all the automobile traffic from Philadelphia to the seashore will be through Mount Holly, Brown's Mills, Lakehurst and Lakewood.

ATTRACTIVE APPAREL FOR MOTORING WOMEN.

MOTORING makes a special appeal to the American woman, and there is absolutely no reason why she should not enjoy her car even in the coldest months of winter. Much of the comfort and convenience exemplified by the modern automobile is due to the desire on the part of designers and manufacturers to produce a car which shall meet her every need. It is the invigorating results of a ride in the open air and the charm of the open country which attract the woman motorist, and while the 1913 touring car or roadster leaves little to be desired, she not only must be becomingly attired, but her motoring hat and coat must be such as to increase her comfort and convenience.

If those responsible for the car have been guided in their efforts by the growing list of women motorists, this is none the less true of those who designed the motoring garments for the 1913 season. Comfort and convenience are reflected in every line, and while each purchaser must study her individuality in making selection, there is abundant opportunity to secure that which will meet every requirement. And in this connection it may be stated that since fashion has decreed that a good looking, warm, long coat may serve for general everyday wear, quite as well as for motoring, it is no longer necessary to feel that one is indulging in a luxury by possessing what is termed a motor coat.

Two Practical Motoring Hoods: At Left, Crocheted Model with Muffler Attached; at Right, Messaline with Chiffon Veil and Buckle.

There are, of course, the more expensive creations, in which the purchaser is more or less assured of an exclusive design, and in this respect the choice is by no means limited. Without doubt there is a certain satisfaction, not to mention prestige, in the possession of a garment, a duplicate of which is not likely to be encountered even when taking a long ride. However, this exclusiveness is guarded more carefully in every respect than was once true. The average woman motorist, particularly those who drive their own cars, has come to appreciate that it is better economy to purchase the so-called ready to wear garment, and it is surprising to note the wide selection possible in this field.

Among the materials offered for the fall and winter coats are: Chinchilla, uncut velvet, plush, Scotch effects, tweeds, cheviots, serges, two-toned mixtures and plain worsteds. The latter is used principally in the new Mackinaws. Double-faced materials with the plaid back are among the newer novelties. Velveteens and broadcloth also are mentioned as excellent materials by some manufacturers. Others add zibeline, the heavy diagonals, Bedford cord and the new boucle cloth.

The new three-quarter length coat is shown in Paris and has gained considerable vogue as an outing garment, especially by the younger element. The Mackinaw has been by far the most successful of these models both in this country and abroad. It is developed both in the plaid and fancy striped worsteds, the latter material resembling that used for striped sweaters. It may be added, however, that these have not been considered the most practical for motoring wear here, so accustomed have women become to the long all-enveloping lines of the full length coat.

In these latter garments, the narrow silhouette, with a slight tendency to draw in at the feet, is still considered quite the proper thing. Wide belt effects across the back, or set all the way around at the normal waist line are in style. Many of the smartest of these coats are trimmed with wide flat fur bands about the neck, down the front to the closing and about the full length sleeves.

For practical everyday wear the sleeve is set in at the medium large arm hole. In other models, however, where an extremely novel cut is employed by the designer, the most complicated seaming imaginable is used, the top of the sleeves being cut in one with the yoke effect, which in turn extends down each side of the front and down the back in panels. Again, a seam extends from beneath the arms to the hem of the coat in the back, the panel thus formed narrowing to-

Digitized by Google

Front View of Callot Copy, in Navy Blue Imported Cheviot.

ward the bottom. On other models the panel effect is used in a slightly different form. It has rounding corners at the top and is set onto the centre back and onto each side of the front, eight inches below the top of the coat, thus forming a yoke effect. In still other instances a narrower panel is set over the panel just described, both being edged with a piping of a contrasting material or trimmed with stitching.

Military effects, stunningly trimmed with narrow bands of braid and buttons are among the popular innovations. These coats are buttoned high at the neck, closing down the left side, the collar and revers being so arranged as to be worn open if desired. In the latter case the underside of the revers is inset with satin in a brilliant shade, and the revers are elaborately trimmed with braid and tiny buttons. In view of the fact that the richer, darker shades are used almost entirely for long coats, this touch of brilliant color, showing only when the coat is opened, is considered excellent.

Although the straight front closing is to be used for long coats almost without exception, according to some designers, the directoire revers and collar will trim many of the new models. This collar, which already has reached considerable popularity in this country, is narrow at the back, extending in a wide point over each shoulder, an innovation after the long vogue of the cut-in-one revers and collar.

The round collar also is used on many of the newer coats, this, too, being cut separately from the revers. The narrow shawl collar, merging into narrow revers, extending to the low left side closing, and the pointed collar, not however as deep as the collar of last season, are both seen. The collarless coat is among the novel cuts of the season, the severity of style and the long, narrow cut both recommending this type to the customer who has her own small furs and prefers to don these instead of purchasing a garment already trimmed with furs.

The new full length seal or moleskin coats are cut on as straight and narrow lines as possible, the semi-fitted idea prevailing, with the drawn-in line at the feet. These are described as simple, collarless, reverless models, closing high at the neck and buttoning down the entire length at the left of the front. The straight front closing is the rule with this type. The front turns back if desired, in revers effect, the inner side being inset with a contrasting shade of silk, in one or two of the new shades of brilliant blue, red or cerise, handsomely trimmed with narrow bands of black braid, and tiny metal buttons in the inimitable style peculiar to the French designer.

The panier idea has made its appearance in the realm of the long fur coats of seal or mole. From five to seven one-inch plaits are laid into the garment at the side seam below the knees or near the hem, this lending a draped appearance across the back and again inspiring the close drawn-in look at the feet. Again plaits are laid in on each side of the back at the waist line. Elaborate braid trimming in military effect is used on the new

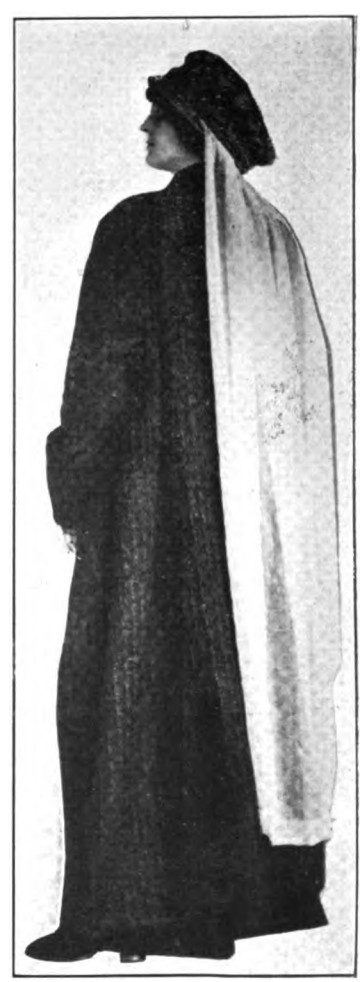
Back View of Callot Copy, Showing New Back and Belt.

Digitized by Google

Fur Lined Coat of Fancy Mixture, Made with Collar of Civet Cat.

coats, each of the bands of braid being finished with tiny buttons.

A limited number of offerings is presented in accompanying illustrations, these being reproduced from photographs prepared by Marshall Field & Co., Chicago, for the National Motor Vehicle Company, Indianapolis, Ind. It may be added that the latter company has issued an interesting booklet of 1913 models in women's motoring apparel, which will be mailed free to those who make application for it. The views shown serve to indicate some of the becoming types which will be worn this winter.



A motor coat which has the new straight back with belt is presented in two views. This is a copy of Callot, and the material in this model is a navy blue imported cheviot. The collar and facing down the front are of fancy striped blue and gray corduroy. The coat is lined with all silk peau de cygne to match the cloth, and the entire effect is that of a well wearing garment, suitable for every occasion. The wide cuffs provide ample protection for the wrists, a feature which will be appreciated particularly by the woman who drives.

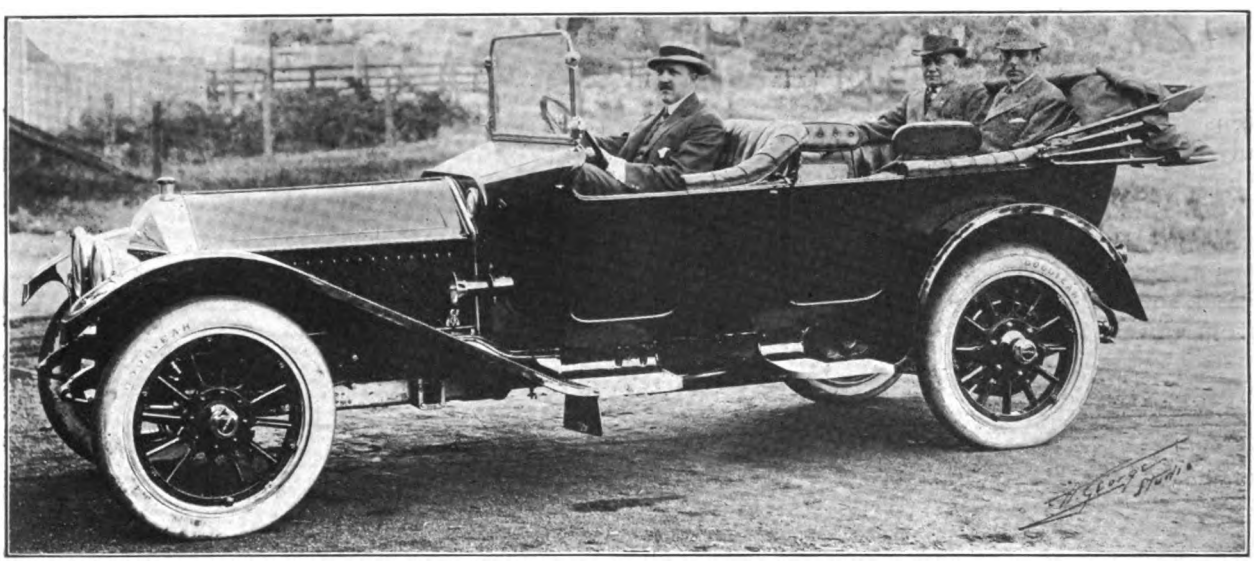
With this model, in the front view, is shown a soft stitched satin hat, made with a soft fold around the crown and full fringe trimming. In the back view the hat is of crushed satin, with Oriental or patent leather band. Either design is light in weight and exceedingly practical for automobile or street wear.

The second design presented is a copy of Piper, and is another very practical coat, especially when it is stated that the front is intended to be worn buttoned closely about the throat when occasion requires. The deep, wide pockets on either side also will make their appeal to those who are seeking warmth for the hands, and it may be added that the same wide cuff seen in the other model is incorporated in this as well. The material is fine imported tweed, with a stripe effect, trimmed on the collar and cuffs with gray velveteen and satin. The lining is of gray silk peau de cygne.

The hat in this instance is of messaline silk, shirred, and as shown is intended to be worn with a long veil of the same or contrasting colors. The effect, when the veil is thrown over the crown of the hat and tied with long ends at the throat, is particularly graceful.

The remaining model shown presents a cloth fur lined coat of fancy mixture, made with a large collar of civet cat, which can be worn buttoned closely at the throat, or fastened at the rever, carrying out the shawl effect seen in the illustration. The coat itself has straight lines with the novelty back, trimmed with large buttons. Two of the newer motoring hoods are shown in the smaller illustrations. The first is a crocheted hood with ample muffler snapping in place down the front, affording full protection for the head and throat. The model is exceedingly light and comfortable, and will make a particular appeal to the woman who dislikes to omit her daily drive in stormy weather. The other is somewhat more pretentious, although quite as practical

Piper Copy of Imported Tweed, Worn with Messaline Hat and Veil.



Digitized by Google

in every way. The material is messaline, with chiffon veil around the crown, through which a buckle of contrasting color is fastened.

NEW SIX-CYLINDER OAKLAND.

An accompanying illustration presents the latest addition to the Oakland line, produced by the Oakland Motor Car Company, Pontiac, Mich., a six-cylinder, 60 horsepower model, which appears to be destined to enjoy wide favor during the coming season. The company is not yet ready to announce the detailed specifications, but it is understood that they will combine a number of interesting features, including a four-speed transmission, etc.

In the picture, George E. Daniels, vice president and general manager of the Oakland company is at the wheel. In the tonneau are: President Thomas Neal of the General Motors Company on the left and Tracy Lyons, director of production for the General Motors Company.

Presenting the New Six-Cylinder, 60 Horsepower, Seven-Passenger Touring Car, Made by the Oakland Motor Car Company, Pontiac, Mich.

MARMON HUNDRED CENTURY CAR.

M. L. Templeton of Indianapolis, Ind., accompanied by his wife and Mr. and Mrs. J. G. Boston, recently left that city in the former's Marmon "32" touring car, made by the Nordyke & Marmon Company, Indianapolis, for a tour of 10,000 miles in 100 running days. The car will be known as the "Marmon hundred century car," and Mr. Templeton plans to enjoy the test trip, carrying complete equipment for camping, including two tents, four sleeping cots, cook tent and cooking utensils, picks, shovels, guns and ammunition for hunting big game. The party expects to arrive at Los Angeles, Cal., in 30 days, covering 2800 miles through Kansas City, Las Vegas, Santa Fe, Albuquerque and Phoenix, Ariz. The tourists will return to Indianapolis by way of San Francisco, Sacramento, Salt Lake City, Denver, Omaha and Chicago.

ALCO ADOPTS TRUFFAULT-HARTFORD.

That shock absorbers are no longer looked upon as a luxury, but rather in the nature of a necessity, appears to be borne out by the fact that a large number of motor car manufacturers are fitting them as regular equipment. Among the more recent announcements is that of the American Locomotive Company, Providence, R. I., which will include Truffault-Hartfords on all of the 1913 60 horsepower Alco cars. This makes a total of 25 producers which are offering Truffault-Hartfords this year, a record of which the maker, the Hartford Suspension Company, Jersey City, N. J., may justly be proud.

FORD CLIMBS MT. WASHINGTON.

Dr. A. H. Harriman of Laconia, N. H., recently drove his Ford touring car, containing besides himself, his wife and two children, up an ascent of 4600 feet, rising more than 500 feet to the mile for a distance of eight miles to the summit of Mt. Washington in the White mountains.

THE PERFECTION SPRING WINDER.

In fitting new accessories to the car and in the overhaul of the chassis, the work frequently requires a special sized spring or one of greater tension than may be secured readily from a supply house. The Remington Tool & Machine Company, Boston, is marketing a simple and inexpensive device known as the Perfection spring winder which is so constructed that it will wind accurately taper, double taper and right or left hand springs of any length, diameter or pitch from any gauge wire. It is constructed in three sizes having capacities ranging from the smallest wire up to .3125 inch.

The tool is illustrated at Fig. 1, the drawing at A showing how the wire is fed when the device is operated by hand, and that at C when in the vise with a mandrel. When utilized in the lathe or drill, an adjustable rotating disc provides for varying pitches as desired. The tool supports the arbor, making possible the winding of the very finest as well as the largest springs without kinking, as shown at B.

FREEING FROZEN PISTON RINGS.

In the event of a piston ring becoming frozen in the piston through a lack of lubricant or other inattention, it is sometimes a difficult matter to remove it without breaking the fragile member. A suggestion for completing the work is given in the Commercial Motor, for which the workman was awarded the first prize in a competition.

The piston is removed from the cylinder and connecting rod and placed upon two bricks laid lengthwise and about two inches apart. A gasoline torch is next utilized, playing the flame on the head of the piston until the metal is a blood red heat. The piston is then allowed to cool slightly, and a little kerosene applied to the seized ring. This method is said to result in freeing the ring even if it is carbonized in.

THE EDISON A. C. CURRENT RECTIFIER.

The growing tendency to light the automobile by electricity presents a new problem to the proprietor or manager of the garage and service station not equipped with means for charging

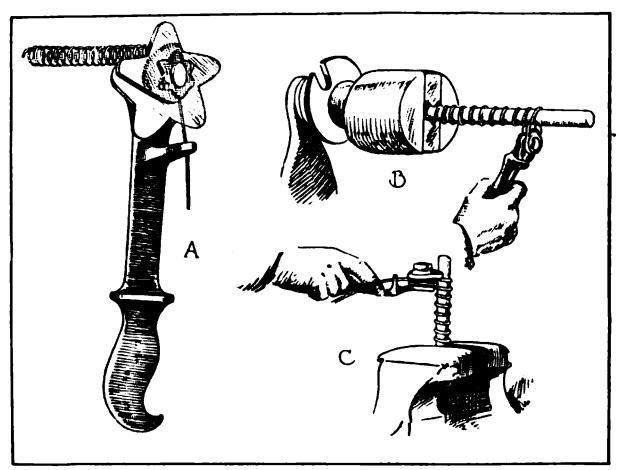

Fig. 1—Useful Tools for the Shop: A, the Perfection Spring Winder; B, Depicting Its Use in the Lathe; C, How Operated in the Vise.

storage batteries. In former years and before the magneto or mechanical generator of electricity replaced the battery as a source of current for ignition purposes, many shops installed charging panels and derived considerable profit thereby.

While the majority of lighting systems make provision for charging by means of the dynamo actuated by the energy of the motor, there are hundreds of cars on which the battery alone is

Digitized by Google

utilized, the equipment being known as the straight storage battery system of lighting. The members employed must be removed from the

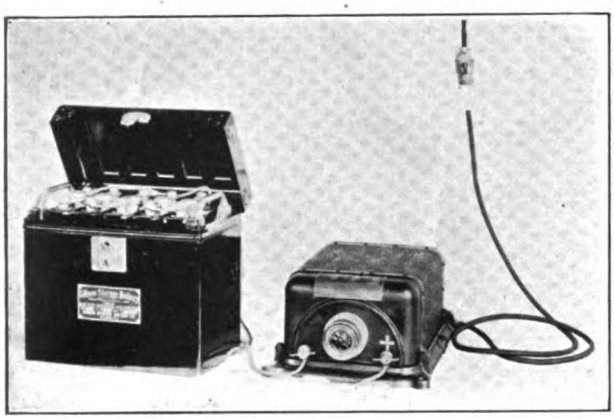

Fig. 2—The Edison Alternating Current Rectifier for Charging Storage Batteries.

machine and charged from time to time, the periods depending upon their capacities, lamp loads and hours of service.

In many garages the current is alternating and it is a well known fact that it must be converted into a direct when utilized for charging storage batteries. Many stations not equipped with rectifiers, send their customers' batteries to a charging station, and the practise not only means expense in time lost, but often the customer is inconvenienced as well.

These objections have been overcome by the invention and development of the Edison alternating current rectifier, produced by Thomas A. Edison, Inc., Orange, N. J., and shown at Figs. 2 and 3. The apparatus is stated by the maker to provide reliable and efficient means of charging batteries with an alternating current and the equipment does not require the services of an expert, it being operated easily by anyone familiar with the ordinary snap button type of switch.

The rectifier is practically a simple electro-mechanical valve in that it allows current waves of only one polarity to pass through it to the cells. The simplicity of operation is illustrated at Fig. 2, which shows the size B-2, eight amperes capacity, charging an Edison five-cell battery. The rectifier is provided with two wing nut terminals, the positive being indicated by a white +. This lead is connected to the positive of the cells and the other wire to the negative terminal. A connecting cord and plug provide means for supplying current from the main line.

The rectifier is equipped with a snap type of switch having "on" and "off" positions and by turning the lever to the former the proper charging current flows to the battery. It is pointed out by the maker that a battery may be charged in the same time with an Edison rectifier as with a direct current.

At Fig. 3 is shown the rectifier, size B-4, 16 amperes capacity, charging two sets of batteries. In order to insure correct adjustment of the charging current, a regulating rheostat and ammeter are employed as a unit. This equipment in conjunction with a cut-out switch and a fuse, inexpensive and easily installed, is recommended by the company when lead batteries of various types are to be charged and different rates of flow of current are required.

All rectifiers are provided with terminals for connecting rheostats in the charging circuit and are constructed for 110 or 220-volt circuits in various sizes to meet individual requirements. The type shown at Fig. 2 is adjusted for a specified charging current and is designed for the owner as well as the trade.

HEALD UNIVERSAL BUSHING CHUCK.

The improvements in the character of material utilized in the construction of motor cars, such as chrome nickel, and manganese steel, and other alloys, have made the use of a grinding machine a necessity in large shops. Carbonizing, heat treating and hardening produce more or less distortion, making the use of the grinder imperative to secure accurate diameters and true surfaces. The method is also valuable for finishing holes when one piece is to be held, for reaming without distortion is difficult when the walls of the work are thin and subject to collapse under the pressure of the chuck jaws.

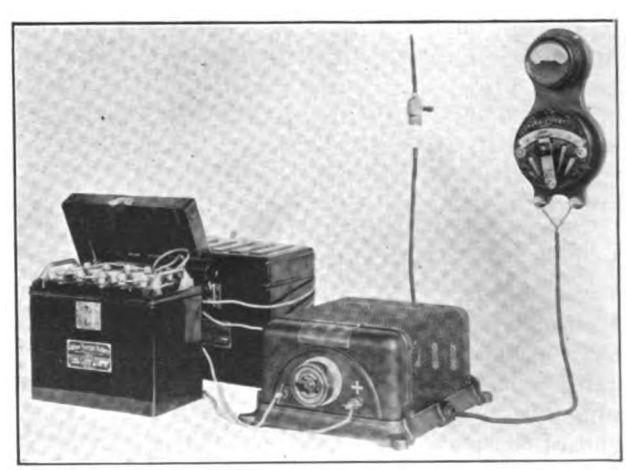

Fig. 3—The Edison Device with Rheostat and Ammeter for Service Where Different Charging Rates Are Required.

Digitized by Google

Other materials, such as cast iron, phosphor bronze, etc., when used for work where accurately round and straight holes of definite diameter

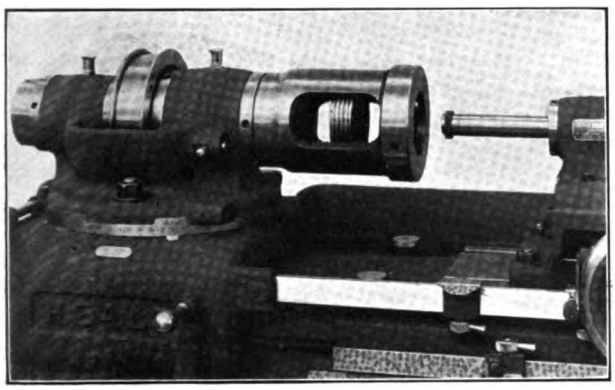

Fig. 4—The Heald Universal Bushing Chuck.

are required, such as wristpin holes, are handled easily by the grinding process and the possibility of distortion is eliminated when the walls of the piece are thin.

The Heald Machine Company, Worcester, Mass., is manufacturing the Universal bushing chuck shown at Fig. 4, designed especially for holding different bushings having thin walls. The bushing is clamped endwise while grinding the hole by a device comprising a barrel shaped holder mounted upon the work spindle of the grinder. On the front end is a removable cap threaded to the end to clamp the bushing, and this is removed to take out the work when finished. The collar at the rear of the bushing is threaded to fit the inside of the holder, and is adjustable for any length of bushing within the capacity of the holder. This rear collar is moved only when the work is changed. Both the collar and the clamp are fitted with interchangeable plates having holes slightly larger than that to be ground, and to handle bushings of different diameters substitute plates are employed.

At Fig. 5 is shown a jig for holding pistons for grinding the wristpin holes. The jig is threaded to the headstock spindle at 1, and the body 2 is bored to receive the piston 5, being held by the clamping screw 4. The piston can be located solely from the drilled hole by use of the plug 3, or if it is desirable to work from the head end of the piston for lengthwise location, a stop pin against the head end of the piston at the point 5 will insure the hole being at a definite distance from the head end, and the plug 3 can then be used simply to rotate the piston on its axis to bring the hole in line with the axis of the grinding wheel. A form of wheel is provided especially adapted for grinding shoulders, as well as holes at the same time. With the Heald device grinding of different tapers at one setting is accomplished by swinging the headstock to various angles as needed.

TOOL BOARD NEAR LATHE.

In performing work with the lathe some workmen lose time because the tools required in conjunction with its operation are not handy. In large machine shops boards are employed for keeping the different tools. One of these members is constructed easily of wood, and hangers or studs for supporting the tools may be made from metal pegs. If desired the board may be provided with a list of the tools pasted thereon, making each man responsible for the return of the tools issued him.

RESTRICTING SLIDING UNIONS.

In the reassembly of the chassis the replacing of the fuel, oil, air and other piping is sometimes annoying because the loose part of the union will slip from the fingers and slide along the pipe to some place difficult of access. A simple kink for preventing this is to solder a ring around the pipe, thus forming a projection against which the union member will strike and stop. Care should be exercised that the ring is so placed that it will not prevent the fitting of the two parts.

LEAKING REAR AXLES.

Not only do leaky rear axles decrease the efficiency of the brakes, but the lubricant spatters over the wheel and mudguards, attracting dust and dirt, as well as making these members difficult to wash. An unusual cause of leakage was

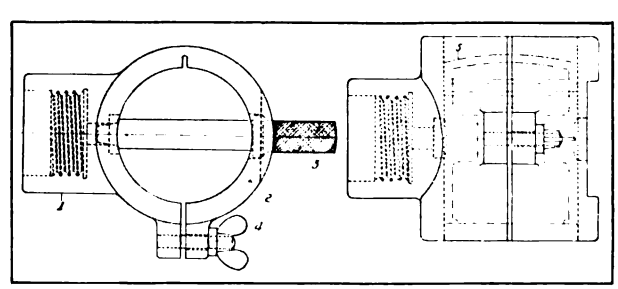

Fig. 5—Jigs for Holding Pistons When Grinding Wristpin Holes with Heald Machine.

noted recently in a car that had been overhauled and felt washers inserted to prevent the lubricant working out from the differential casing.

Digitized by Google

The repairman noted upon testing the car after cleaning out the old grease, that the oil did not show on the drums until the machine had been run some distance. Placing his hand upon the drums, it was found that these members were warm and that the heat had melted the lubricant which found its way to the brakes. The latter were readjusted and the trouble disappeared.

R-C-H HAS SUCCESSFUL YEAR.

Since July 1 the R-C-H Corporation, Detroit, maker of R-C-H cars, has closed contracts for 15,120 machines for delivery during the 1913 selling season. These orders give some idea of the company's business during its first year of life. About 20 per cent. of next year's output will be for export purposes. One instance of this foreign business was given recently by Thomas Byrom, the British representative of the R-C-H, who before leaving Detroit predicted that he would place 1000 of this make in Great Britain within a year, having 46 dealers in the United Kingdom.

AMERICAN IN MIMIC WARFARE.

The value of the automobile was thoroughly demonstrated during the recent military manoeuvres in California when some 10,000 troops, divided into two opposing "armies" attempted the theoretical invasion and defense of the Pacific seaboard. An American underslung car, made by the American Motors Company, Indianapolis, Ind., and owned by Capt. F. A. Marriot, quartermaster of the Fifth California infantry, was attached to that regiment as a part of the defending army.

The machine was in constant use throughout the manoeuvres, acting as an ambulance in at least two emergency cases, taking the place of five horses in transporting officers about the fighting zone, hauling supplies and ammunition to various parts of the camp and to outlying points where troops were on outpost duty, lighting the camp after dark, etc. Several times it was used to convey scouting details, and on one such occasion the photograph reproduced herewith was taken.

In all of this work the American car not only provided a much more rapid means of conveyance than horses or mules, but rendered service it would have been impossible to perform with animals. In addition there proved to be a decided saving in the officers' time for transacting business, in that it did away entirely with the necessity of caring for their mounts. Good and bad roads and trackless cross country routes, sometimes including large plowed fields, were traversed without mechanical trouble of any nature.

Scout Detail with American Car Taking Part in Recent Military Manoeuvres in California.

M. S. Bridgham of Seattle, Wash., recently took four passengers in his 1913 Cadillac and made a tour of the city for one hour, covering approximately 14 miles, negotiating the most formidable hills the city affords and never once shifted out of high gear, his object being to demonstrate the thorough practicability of the car.

NEW HOME FOR PITTSBURG SCHOOL.

ONE of the most successful automobile schools in the country is the Pittsburg School of Automobile Engineering, Pittsburg, Penn. The institution was founded in 1906, with the following officers: President, C. P. Galanot; vice president, A. J. Schmitz; secretary and general manager, W. H. Schmitz, and treasurer, H. P. Smith. Its growth has been in keeping with that of the industry, and recently it moved into its fourth location, the handsome two-story building shown in an accompanying illustration. In addition to this structure the former building in the same city block will be retained, having been equipped as a first class machine shop for repair work and for the construction of 1.5 and two-ton trucks.

New Home of Pittsburg School of Automobile Engineering, Pittsburg, Penn.

As may be concluded from this statement, the course provided for the students at this school is most complete in every respect. Not only are they made thoroughly acquainted with the theory of motor car construction and operation, by the use of text books and under the guidance of experienced automobile men, who have seen long service in manufacturing plants, but they have opportunity to become as well informed in practical work.

The building shown is of fire proof construction, throughout, and is 94 by 128 feet. It comprises a garage, in which the school maintains provision for the storage and care of machines, and sells supplies and gasoline. By this method the students are taught to become familiar with the garage business, in all its branches.

Six skilled instructors, each a specialist in his department, have charge of the school proper. First, the students are given a thorough foundation for the work in explosive motors, wiring, carburetors, magnetos, etc., after which they enter the repair shop, where they are under the direct supervision of President Galanot. This course includes everything from simple repairs to the rebuilding of a motor car.

Electrical engineering is under the superintendency of H. P. Smith. A. J. Schmitz has charge of the road work, teaching beginners the art of driving pleasure and commercial vehicles of all types. The machine shop is under the supervision of William Stocker, assisted by John B. Niklas. The former is machine foreman and the latter gives the students his undivided attention. Secretary W. H. Schmitz gives instruction in salesmanship.

The second illustration herewith is that of the 1912 graduating class, and gives an excellent idea of the type of young men who are gaining their training in automobile engineering at the hands of this corps of competent instructors.

Members of the Class of 1912, Pittsburg School of Automobile Engineering.

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS.

The Cello Hot Water Bottle is marketed by A. S. Campbell, 284 Commercial street, Boston, and is a canteen shaped, flat, convenient container, made of a high grade material, 75 per cent. of which is copper, and nickel plated. It is provided with an insulated neck, preventing the burning of the fingers when filling it with heated fluid. It is very durable and will withstand severe service. It is claimed that it will give off 50 per cent. more heat than hot water bottles of ordinary construction. It is made in various sizes, the capacities ranging from one pint to 2.5 quarts.

—— ★ ——

The McKim Gasket, produced by the McCord Manufacturing Company, Detroit, is a combination of copper, brass and asbestos, and a quality claimed of the device is that it provides elasticity as well as strength. It is designed for service with all types of internal combustion motors, being utilized on any joint where a gasket is required. It comprises a ring of high grade asbestos or asbestos twine, according to the service required, and a shell of especially treated copper. The latter makes it possible to utilize the gasket several times for the metal does not adhere as do some forms of packing. The gaskets are manufactured in various sizes and shapes and are inexpensive.

—— ★ ——

The La May Fire Extinguisher, manufactured by the La May Machine Works, Rochester, N. Y., is designed for automobile service as well as the garage, and the chemical combination is said to be proof against heat or cold. The device is compact, being three by 14 inches, weighs but five pounds and is finished in nickel, brass or special colors. The solution employed is said to be non-poisonous and will not injure the finest fabric. It is easily operated, by pressing a red button at its top permitting the flow of the solution, which is forced out by pressure. The extinguisher may be recharged when necessary by unscrewing a winged nut and replenishing the supply of chemical. Proper pressure is obtained by a pump. Among the qualities claimed of it is that it will extinguish electric fires without danger of a shock to the user.

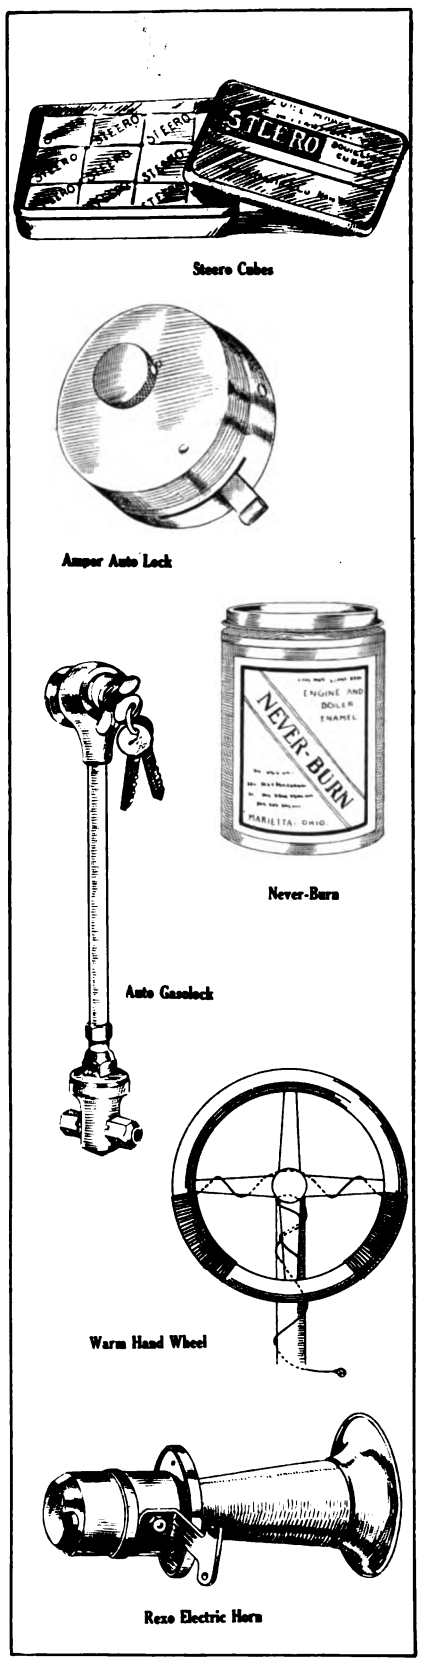
—— ★ ——

The Zilio Boot differs from the usual blow-out patch in that lacings or straps are eliminated, being replaced by a mechanical device which is claimed to hold the boot securely in place as well as to prevent marring the spokes and felloe of the wheel. The boot is provided with two clamp members, these being securely riveted to the material, and their shape is such that they grip the shoe near the bead, protecting a rim cut tire. Two arms integral with the clamps are drawn and secured together easily, the operation requiring but a few seconds. The boot is manufactured by the Zilio Sales Company, 3261 South Park avenue, Chicago.

—— ★ ——

Steero Bouillon Cubes are manufactured by the American Kitchen Products Company, New York City, and one cube makes a cupful served in hot water. They come in boxes of 12 or tins of 50, compactly arranged, and may be stored easily in the

Digitized by Google



car. They are not affected by changes of temperature and are produced for motoring tourists and in conjunction with a Thermos bottle provide convenient means of nourishment when touring.

—— ★ ——

The Amper Auto Lock, manufactured by the Amper Electric Company, Lockport, N. Y., is a combination switch locking device adapted for service on motor cars and motor boats. It is so designed that it may be attached to the coil or dash, as desired. It is constructed in two parts and the base is screwed to the coil or dash. The connections for the battery and magneto or both are incorporated in the base, preventing tampering with the terminals. The lock case is provided with a knurled disc, which when rotated according to the combination permits the utilization of the switch lever. A simple movement of the disc locks the device. The lock case is secured through the combination mechanism and it is essential that the combination be known to remove it as well as to operate the switch lever. The combination may be changed from time to time as desired.

—— ★ ——

The Warm Hand Wheel is being marketed by the Warm Hand Steering Wheel Company, 527 Fifth avenue, New York, and will appeal to motorists in cold weather. It consists of a coil wound around the lower half of the wheel rim, or that portion grasped by the driver. The coil is connected by flexible wires to the battery or a dynamo when the car is lighted by a generator. The current heats the coil and it is stated by the maker that it consumes but little energy. In addition to warming the hands the coil serves as a grip. The device is inexpensive and is especially suitable to Ford cars having the flywheel type of magneto. The company also manufactures a foot warmer, an adaption of the device.

—— ★ ——

Never-Burn is manufactured by the Northwestern Chemical Company, Marietta, O., and is an especially prepared baking enamel for use on motors or components of the chassis of a motor car subjected to a high heat. It provides a glossy, black coating that is kept clean easily and the maker claims that the material is not affected by high temperatures. It comes in a neat can and the quantity varies from one-half pint to a gallon, is applied easily and is inexpensive.

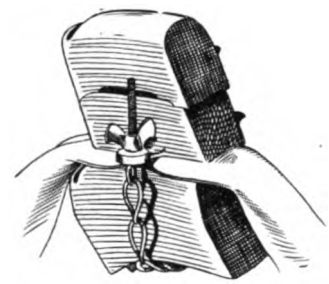
—— ★ ——

The Gasolock is manufactured by the Auto Lock & Specialty Company, Detroit, and comprises a Yale lock, controlling mechanism and a shut-off valve. The latter is fitted in the fuel line between the carburetor and the tank. The movement of a lever on the lock member actuates the valve, closing or opening it as desired. The device is secured by means of a key which is removable, and may be located on the dash or any other convenient place.

—— ★ ——

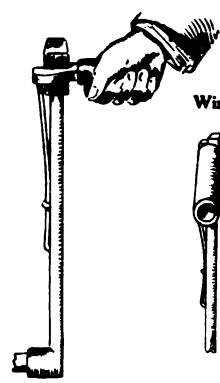
The Rexo Electric Horn has been brought out by the Dean Electric Company, Elyria, O., to meet the demand for a moderate priced signalling device. The new horn embodies the same high grade material and workmanship as those previously produced by this company and the same electric principles are also incorporated. It is economical of current, consuming less than 1.8 amperes, and may be operated

Digitized by Google



by any six-volt battery or set of dry cells. It provides a clear penetrating tone, is weather and dust proof and it is stated by the maker that it does not require any adjustment or attention after being installed.

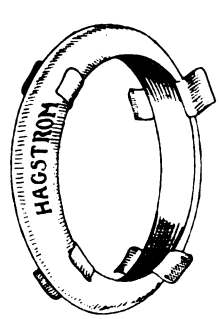
—— ★ ——



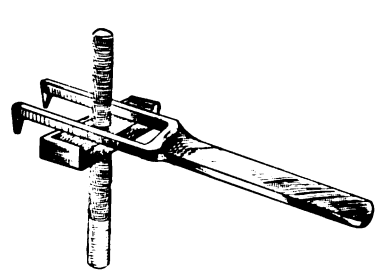
The McVey Vulcanizer, produced by the McVey Manufacturing Company, Dayton, O., is an automatic, portable outfit which will appeal to the motorist who desires to make his own repairs to casings and inner tubes. It may be employed upon the road or in the garage and the maker states it will perfectly vulcanize a patch in 25 minutes upon a tire and in 15 minutes upon an inner tube. The complete outfit weighs but seven pounds and may be stored easily in the tool kit. It is stated that the operation may be performed by anyone as all that is necessary is to fill the vulcanizer with an ounce of gasoline which when ignited by a match will burn out and retain sufficient heat to vulcanize properly. The equipment comprises the vulcanizer, cement, rubber, scissors, etc.

—— ★ ——

The Wink Safety Crank is manufactured by the Wink Crank Company, 2106 Superior viaduct, Cleveland, O. It is designed to prevent injury to the operator when cranking a gasoline motor and it is stated that in the event of a premature explosion or back fire the handle automatically swings back out of the way, preventing its striking and injuring the hand or arm of the operator. The handle is pivotally mounted and provided with a spring which permits the handle of the crank to be rotated in one direction, but upon a reversal or back fire the spring becomes active.



McVey Vulcanizer



Wink Safety Crank

Cowles Coupe Mirror

Hagstrom Inner Liner

P. C. W. Valve Lifter

The Coupe Mirror, manufactured by C. Cowles & Co., New Haven, Conn., is designed for enclosed car or taxicab service for the benefit of the passengers. The mirror proper is approximately seven by two inches and the overall length is eight. It is of the adjustable type and may be swung easily to any desired angle. It is constructed of polished brass, nickel or silver and is inexpensive.

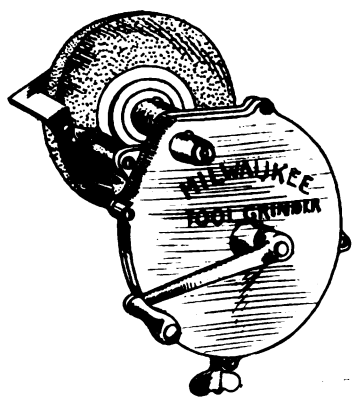
—— ★ ——

The Hagstrom Inner Liner, produced by the Hagstrom Manufacturing Company, Lindsborg, Kan., is of the self-vulcanizing type, making it an easy matter to apply it to a casing. The work involves the washing of the interior of the shoe with gasoline and moistening the proper side of the liner with fuel. After the gasoline has evaporated the liner is inserted and is cemented automatically. The liner is provider with four flaps, which are placed around the bead of the shoe, preventing creeping. It is composed of a high grade material, designed to fit accurately the interior of the tire and may be utilized in old casings, thereby augmenting their efficiency.

—— ★ ——

The P. W. C. Valve Lifter, marketed by J. Stewart Smith, 1779 Broadway, New York City, has three parts and a quality claimed of it is that it is easily and quickly adjusted to any desired position and height. It comprises a threaded rod member which carries a recessed plate, providing a fulcrum for a forked lever. The latter has projections so designed that it may be slipped under the retaining collar of the valve spring. The fulcrum plate and rod are compact and the former may be moved easi-

Digitized by Google

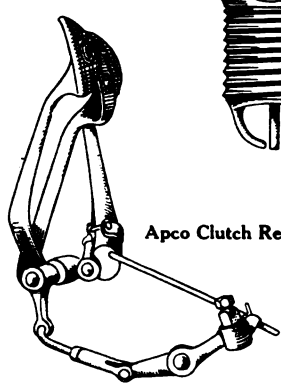


ly to any required height. The maker states that the valve lifter will fit any type of motor. It is moderately priced.

—— ★ ——

The Milwaukee Tool Grinder is produced by the Garage Equipment Company, Milwaukee, Wis., and the tool is designed for attachment to the work bench or table by means of a thumb screw. It is a practical tool for the garage or repair shop not equipped with power as with it tools may be sharpened and parts ground. The device is equipped with gearing the ratio of which produces a high speed, energy being applied by means of a crank and handle. The gears are completely enclosed and are said to be noiseless in their operation as well as very enduring. Carborundum wheels are utilized, these being seven and 5.75 inches diameter respectively. The grinder is fitted with a tool rest, made in two sizes and is moderately priced.

—— ★ ——



The Crary Gasoline Lock, manufactured by the Crary Gasoline Lock Company, Detroit, is as the name implies, a device for shutting off the supply of fuel from the main tank to the carburetor, thereby preventing the use or theft of the automobile by others than those in possession of the key. The locking device is similar in appearance to the ignition switch and is located upon the dash or other convenient place. Leading from the lock is a flexible steel shaft, enclosed in a tubing to prevent tampering with the actuating mechanism. The latter is incorporated in the main line between the tank and the carburetor and a simple movement of the lever key closes a valve member, securely locking the fuel. The lock is a Yale and the key is removable. The device not only prevents theft of the car, but enables the owner to shut off the fuel, eliminating loss by flooding of the carburetor. The Crary fuel lock is constructed of high grade material, nicely finished and easily installed.

Milwaukee Tool Grinder

Vital Spark Plug

Apco Clutch Release

Crary Fuel Lock

—— ★ ——

The Vital Spark Plug is marketed by the Bigsby Manufacturing Company, Cleveland, O., and a quality claimed of it is simplicity of construction. The base or shell is provided with two extensions which project into the combustion chamber of the motor and between the points is located the electrode. The latter is constructed of nickel steel, in one piece, and the maker points out that it is not affected by heat. The electrode is carried in a porcelain member and gas tight qualities are secured through the utilization of asbestos lined copper gaskets. A copper washer is fitted under the head of the electrode member, which may be removed easily if desired.

—— ★ ——

The Apco Clutch Release is a product of the Auto Parts Company, Providence, R. I., and is designed for model T Ford automobiles. It is a simple and practical device that automatically releases the clutch when the foot brake is actuated, thereby permitting the driver to apply the service brake without first throwing out the clutch, an arrangement making for economy of the brake lining. It will appeal particularly to those learning to operate the car and also prevents stalling of the motor by injudicious use of the brake. The device is inexpensive and may be applied with any ordinary screw driver, the work requiring less than 10 minutes.

GOOD ROADS BENEFICIARIES.

That the motorist is by no means the only party to benefit from the expenditure of money for good roads is set forth in a decidedly convincing manner by the recent report of the United States office of public roads. Why, then, should the motorist be expected to bear the expense of constructing and maintaining improved ways?

"Land values increase immediately when roads are improved," reads the report, and it goes on to prove the assertion. In Lee county, Virginia, a farmer owned 100 acres between Ben Hur and Jonesville, which he offered to sell for $1800. In 1908 this road was improved and although the farmer fought the improvement he has since refused $3000 for his farm. Along this same road a tract of 188 acres was supposed to have been sold for $6000. The purchaser refused the contract and the owner threatened to sue. After the road improvement, and without any improvements on the land, the same farm was sold to the original purchaser for $9000.

In Jackson county, Ala., the people voted a bond issue of $250,000 for road improvement, and worked 24 per cent. of the highways. The census of 1900 gave the value of all farm lands in Jackson county as $4.90 an acre. The selling price at that time was from $6 to $15 an acre. The census of 1910 places the value of all farm property in that county at $9.79 an acre, and the selling price is now from $15 to $25.

Only two examples in a long list are presented. Figures from the Denver Chamber of Commerce show that 6000 motorists visiting Colorado have expended $2,700,000 in that state alone since the agitation for better highways was begun. Who reaps the benefit from good roads? Why, then, does the state legislature invariably suggest an increase in the automobile registration fee, every time the subject is mentioned?

EXTENDING THE VACATION SEASON.

The influence of the automobile upon the vacation season in the White mountains is reflected in the announcement that most of the leading hotels in that section have postponed their closing dates until the latter part of October or early in November. In former years the season may be said to have been closed abruptly at the beginning of September. That the hotels are able to enjoy another two months of business this year is due to the fact that they depend almost entirely upon motorists.

There is no denying that the mountains are at their prettiest during the autumn months. Road conditions have been improved so that it is possible to reach these resorts with little more

Digitized by Google

difficulty than the outlying sections of the city. The air is even more invigorating with the coming of the frost. This extension of the vacation season is of decided benefit both to the motorist and the hotel proprietor.

TRUCKS IN MASSACHUSETTS.

The Massachusetts highway commission has announced its intention of giving the cities and towns an opportunity to be heard with reference to the bill introduced in the legislature of 1912, restricting the use of the public highways to trucks of a certain capacity. It is presumed that the opponents of the bill also will obtain a hearing, and they should make sure that they take advantage of the opportunity.

The bill is the result of the failure of certain bridges throughout the commonwealth to sustain the extra weights placed upon them. Apparently its advocates believe it better to delay the day when these bridges must be rebuilt to accommodate the needs of modern transportation facilities. That the motor truck interests have the able assistance of the daily press is borne out by the following from the Union of Springfield, Mass.:

Generally speaking, the use of our highways for commercial purposes should not be discouraged. It is this use of the roads that is counted upon as a factor to reduce the cost of living both by affording farmers a convenient means of marketing their products and enabling wholesale and retail dealers to distribute these same products economically.

In no other city in the country is the value of the mechanical transport better appreciated than in Springfield. The city is a commercial centre of importance, and motor trucks are constantly engaged in competing with the railroads up and down the Connecticut valley, and into the hills on either side. The people of Springfield and vicinity are able to realize the economic value of motor haulage. They know it would be a mistake to retard the progress of the newer method of transportation at this time.

UNIVERSAL LIGHTING LAWS.

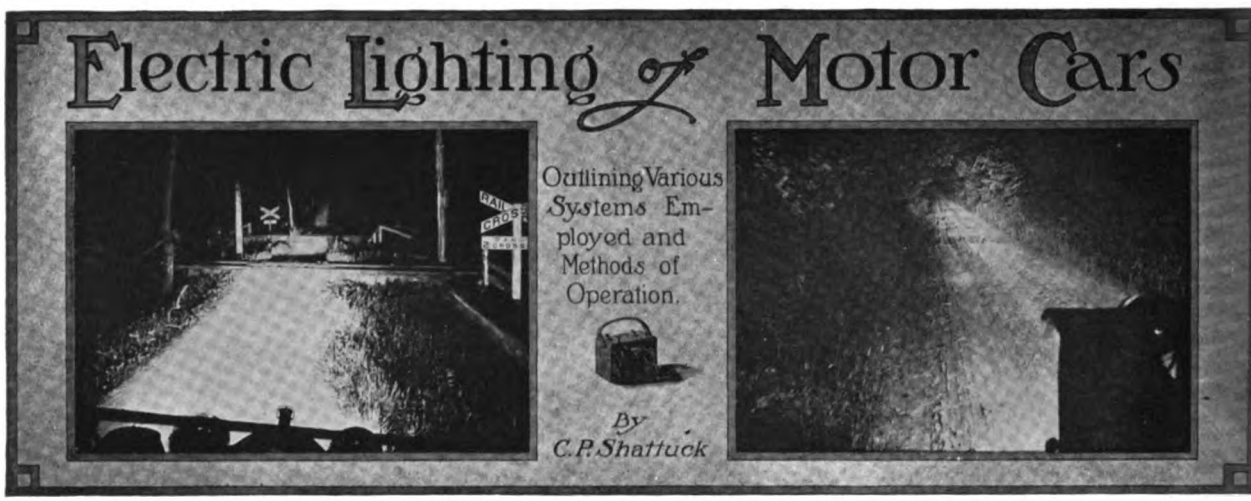
With the close of the fall campaign and the approach of the legislative season, motorists will do well to remember their needs. Those states which have tried the plan of requiring lights on all vehicles using the highways during the hours of darkness furnish abundant evidence of the desirability of such legislation. The safety, both of the motorist and the occupants of a horse drawn vehicle, demands that similar laws be enacted in every commonwealth.

California has been agitating the proposition all summer. The movement has taken concrete form in the bill now under preparation by the Automobile Club of Southern California. The organization has taken the proper means of enlisting public opinion, by publishing its list of arguments in the local press. There seems little doubt that the law will be on the California statute books before spring.

AMERICAN CARS ABROAD.

In a recent issue The Automobile Journal called attention to the attitude of the British motoring press with reference to the American automobile, in which it was set forth that "the American car manufacturer has a public to deal with almost totally ignorant of motoring or motors." It will prove of interest to note the German opinion, reflected in the editorial columns of the Berliner Zeitung am Mittag as follows:

The principle of the American manufacturer is to make his price as low as possible by manufacturing in large quantities, in some cases 40,000 to 60,000 cars a year, and by delivering the car complete and ready for the road. * * * This production in large quantities, with its accompanying lowering of the price, naturally results in a wider market, which in turn increases the demand, which again reacts upon the output. This high output makes possible a reduction in the cost of production, and a still lower price, so that we have a steady cycle, tending to lower prices, which, however, will find its limit in the cost of raw materials and labor.



Another factor is that Americans specialize on two types (20 and 30 horsepower), so that the cost of constituent parts is thus further reduced. The short space of time required for delivery is also of great importance. In America, in a great many cases, the owner drives his own car and has no chauffeur, so it is easy to understand that many now have cars who a few years ago regarded them as a great luxury.

Owing to their low price, it is often deduced that American cars are constructed from poor materials and can therefore furnish but a limited service. This, however, is not the case; indeed the bad condition of the American roads soon showed the manufacturer that only by using the best materials could he compete with his rivals in trade.

It cannot be gainsaid that Americans, in their ceaseless search for new markets for their tremendous output, will seriously menace our industries. This is already shown by the fact that several selling agents in Germany expect to handle American cars this coming year.

Leaving aside the wide difference of opinion between the British and German investigator, there appears little doubt that the American manufacturer is making rapid gains in the foreign market.

Part XVII—The Wagner System.

THE electric lighting equipment for motor car service produced by the Wagner Electric Manufacturing Company, St. Louis, Mo., includes a self-regulating dynamo, an automatic switch which connects the generator to the battery and cuts out the latter at predetermined voltages, a specially designed lighting storage battery, junction boxes, switch, wire, and other necessary fittings.

The generator, which is illustrated at Fig. 120, is a compact dynamo, developing a direct current and the maker states that it is self-contained and automatic at all speeds above a certain minimum. The regulation of the generator is not dependent upon the field weakening as the speed of the automobile increases and at high ratios the chart depicted at Fig. 124 shows a uniform voltage under widely varying speeds, these ranging from 400 to 3250 revolutions a minute of the dynamo armature.

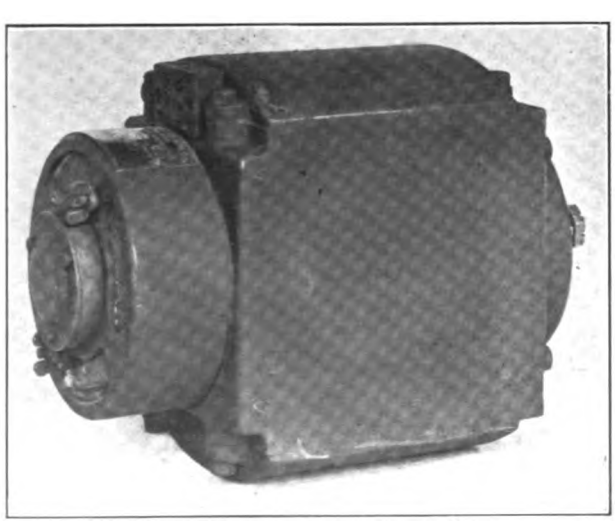

Fig. 120—The Wagner Lighting Dynamo, Supplying Current at Car Speeds of About Six Miles an Hour.

By a peculiar construction of the generator it is claimed that a constant or even voltage is provided despite the widest variation of motor car speeds, and that the dynamo will operate at maximum and minimum ratios without sparking at the brushes, a desirable quality in lighting dynamos. The main field of the dynamo is of the well known shunt type. The material and workmanship are in keeping with the high quality electrical appliances produced by the company, and although the dynamo is oil and dust proof, its components are readily accessible.

Automatic Switch.

The other principal component of the Wagner system is the automatic switch depicted at Fig. 121, the function of which is to close the circuit between the dynamo and the storage battery when the former develops the proper charging current and to open the circuit when the generator voltage falls below that of the battery. This is essential, for as previously explained, the battery would discharge through the dynamo when the latter was operating at low ratios or the motor car was inactive.

The diagrams of the automatic switch are presented at Fig. 123 with the components plainly marked. It will be noted that the coils A are connected in shunt across the terminals of the generator. These coils are so adjusted at the factory as to close at the instant the dynamo develops a voltage exceeding that of the battery; that is, when the current of the generator is stronger by a certain margin than that of the member to be charged.

The coil B is connected in series. It will be

Digitized by Google

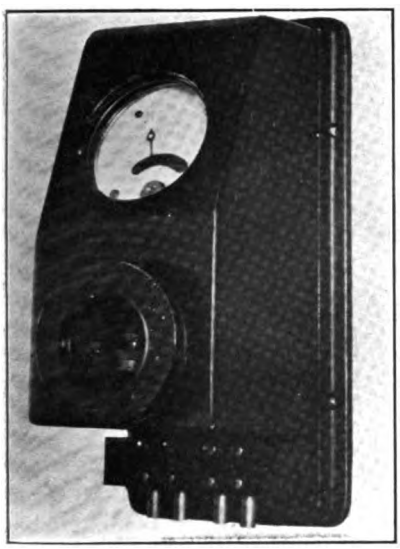

Fig. 121—The Wagner Automatic Switch.

noted that the member includes two contracting arms the pressure of which is augmented when current flows from the generator to the battery. When the speed of the motor car, and consequently that of the dynamo, falls below a predetermined minimum, approximately a car speed of six miles an hour, current tends to flow from the battery to the generator. This causes the contacting arms to move, separating the points and breaking the connection.

The operation of the device is automatic and as each switch is carefully assembled and subjected to tests, the maker states that it will require no attention whatsoever from the user. Incorporated in the device is an ammeter which indicates to the driver the condition of the system, showing the rate of charge, also that of discharge of the battery, an arrangement making for the efficiency of the system.

Characteristics of Generator.

The operating characteristics of the Wagner dynamo are depicted at Fig. 124, the chart showing a uniform voltage under widely varying speeds of the dynamo. At about 300 revolutions a minute of the armature the generator develops slightly over six volts and the rise is gradual up to 1200 revolutions a minute where the voltage is under eight volts and is held uniformly constant at higher ratios.

A variance in the amperage is noticeable. Beginning at zero at approximately 400 revolutions a minute of the armature there is a steady rise until at 1400 revolutions a minute the generator is developing its maximum, nearly 12 amperes. Thence the curve shows a gradual decline, the amperage falling to slightly above eight at 3400 revolutions a minute of the armature. This provides a variable charge.

Function of Battery.

When the battery is not fully charged it absorbs current from the generator and the battery is utilized to supply electricity for the lamps when the generator is operating at too slow speed to provide the proper current and when the car is inoperative.

The six-volt battery is designed and constructed by the company and was subjected to severe tests in automobile as well as train lighting service. It is stated by the maker that it will withstand the most severe service and that the connections between the several plates and elements are of generous proportions. Each individual cell is accessible without disturbing the others and all connections are thoroughly protected.

It is also pointed out by the maker that no trouble will be experienced from an overcharge, due to the natural rise of the potential of the battery as a fully charged condition is approached owing to the arrangement of the elements and the inherent regulation of the generator. The battery may be located upon the running board or at some other convenient place and is enclosed in a heavy pressed steel container as indicated at Fig. 122, which shows the battery slightly elevated to illustrate the connections and terminals. In average service it is stated that the battery will supply current for two headlights, two side and a tail lamp for approximately 10 hours without assistance from the generator.

When the automobile is operated in the usual manner the lighting will be automatic and when the voltage of the battery falls the operator is warned by the indicating instrument and it is a simple matter to start the motor when the generator will restore the battery to normal conditions. It is pointed out that it is unusual for the car to remain standing with all lights on for any extended period and that the battery will not be fully discharged under ordinary circumstances.

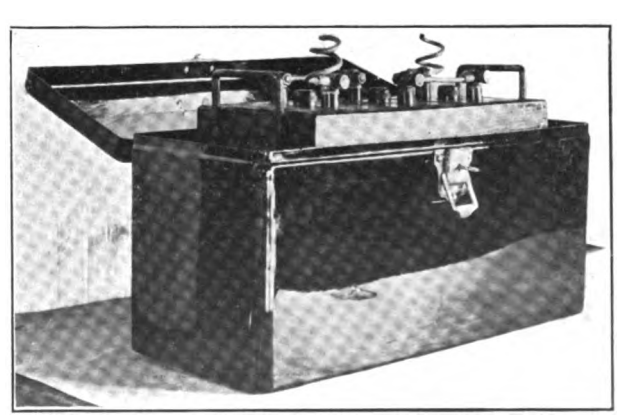

Fig. 122—A Six-Volt Storage Battery Is Utilized with the Wagner System.

Digitized by Google

Lamp Loads.

The Wagner system provides for the usual group of lights, including trouble lamp, cigar lighter, dome, speedometer, etc., the junction boxes being wired as desired. The wiring plan includes connecting the tail lamp in series with that of the dashboard member, an arrangement which makes for notification of the driver of the burning out of the rear signal as the dash bulb also will be extinguished. The switch is of the multiple type, although any standard design may be utilized with the system. Provision is also made for the employment of devices for converting the gas headlights into electrical units.

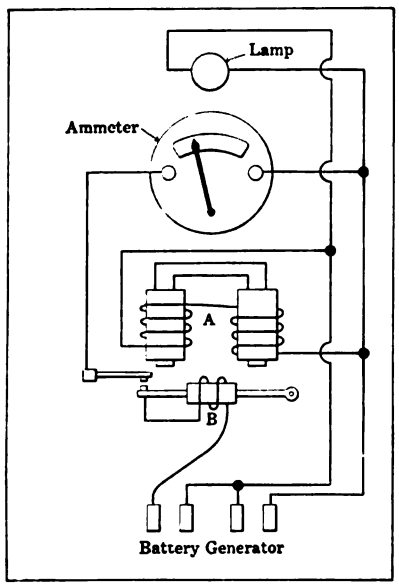

Fig. 123—Connections of Automatic Switch.

The generator may be driven by silent chain, shaft or gears, according to convenience in installation and as it will deliver six volts when operated at any speed above a predetermined number of revolutions a minute corresponding to a car speed of six miles an hour, the company holds that it provides a steady and constant source of current to the lamps and other components of the equipment.

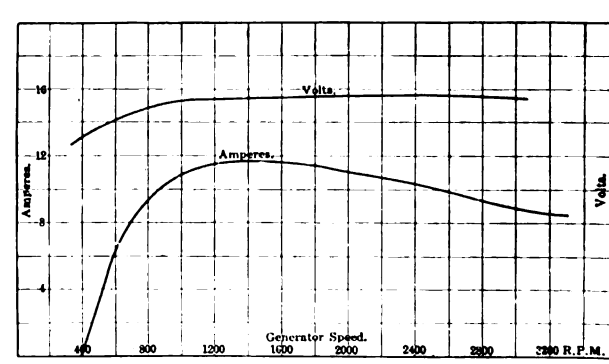
PERFECTION LIGHTING SYSTEM.

Simplicity and ease of installation are qualities emphasized of the Perfection lighting equipment made by the Economy Manufacturing Company, Economy, Penn. The system comprises, in addition to the two prime units, the generator and storage battery, an automatic mechanical cut-out, ammeter, switch and wiring. The maker lays particular stress upon the fact that the machine is constructed without insulated screws or bushings and that opportunities for broken-down insulation are eliminated thereby. The entire insulated portion of the generator is separate and apart from the balance of the construction, the brushes, springs, terminals, etc., being mounted upon a single insulated ring, and the generator proper is assembled with ordinary screws. Another feature of the machine is its base plate. This is constructed of a compositon of ebony and asbestos wood, non-conductors of electricity, permitting of the installation of the generator upon any metal base without possible chance of loss of magnetism.

Magneto Type of Generator.

The Perfection generator is of the magneto type, and the company points out that it is particularly adapted to automobile service in that it is not subject to reverse in case the battery is allowed to discharge through it. The magnets are of the permanent horseshoe type, of tungsten steel, and for these the maker claims freedom from troubles due to moisture, oil, etc. It is also stated that the magnetic density of the field remains the same (having maximum density at low speed), and that this self-regulating feature also prevents excessively high voltages as well as protects both the machine and battery.

Wide variation of speed is made possible through a special construction of the armature, self-regulating features being incorporated. The armature is of ample size, being 2.5 inches in diameter, and its shaft is constructed of a high grade material, is .625 inch in diameter and rotates in imported F. & S. bearings. The winding is securely wedged in well insulated slots, and both the armature and commutator are pressed upon the shaft and retained without nuts or keys. The armature is hand wound. The commutator is two inches in diameter, constructed of high grade material, and the brush holder, as previously pointed out, is separate and easily removed for inspection purposes. Constant tension of the brushes is maintained by spiral springs and the brushes may be removed by withdrawing a screw. All parts are fully protected from dust, dirt, oil or moisture.



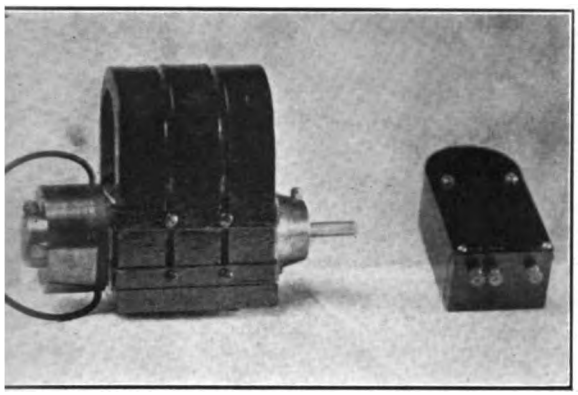


Fig. 124—Operating Characteristics of the Wagner Lighting Dynamo.

The automatic cut-out, which is depicted at . 125, is of the mechanical type, very compact, is sealed to prevent tampering. The maker

. 125—The Perfection Generator and Automatic Cut-Out.

tes that it is positive and reliable in its action l may be installed on the dash, under the hood n any convenient place. Its function is to pre- it the discharge of the battery through the ierator, when the latter is inoperative or not eloping sufficient energy for proper charging. der the last named condition the cut-out is n, but upon the generator attaining a prede- mined speed the cut-out closes, establishing nections between the generator and the bat- y. This office is performed automatically and company guarantees the device for one year. The generator is designed to have an output eight amperes at 1500 revolutions a minute, l in most installations will meet the require- nts at twice the engine speed. The maker nts out that to charge a 40 to 100 ampere-hour pacity storage battery the current should not supplied faster than three to six amperes an ar. With the Perfection system it is stated it as the battery approaches a fully charged ndition the natural rise of the internal poten- l decreases the rate of charge to a point where, thout injury, it will absorb the increased out- t of the generator.

Method of Drive.

The generator may be driven by silent chain gear, the general ratio being about one to two nes motor speed. The company manufactures wide variety of driving sprockets suitable for achment to the crank, cam or pump shaft and mplete directions for installation accompany ch equipment. The machine, being about the ne size and weight as the usual ignition mag- to, lends itself readily to installation and is par- ularly adapted to automobiles not provided th electric lighting systems.

In installing, proper polarity is obtained easily. With each equipment is provided a piece of pole finding paper. The material is wet and the two wires leading from the machine are placed on it, but apart from each other. With the machine operating the negative pole will be denoted by the lead producing a red spot on the paper.

The wiring diagram is presented at Fig. 126, and it will be noted that provision is made for the installation of an ammeter in the circuit, the function of this member being to enable the operator to note at a glance the operation of the system. The Perfection equipment is designed to maintain a group of five to seven tungsten lamps, as well as to keep the storage battery in a fully charged condition, and wiring plans are supplied for incorporating the ignition circuit if desired. As the battery is floated upon the line it acts as a reservoir and balancer, maintaining a uniform voltage at all times.

NORTH EAST COMBINATION SYSTEM.

The North East equipment, manufactured by the North East Electric Company, Rochester, N. Y., is a combination system including an electric motor starter and generator as a unit. The entire system comprises a generator, storage bat-

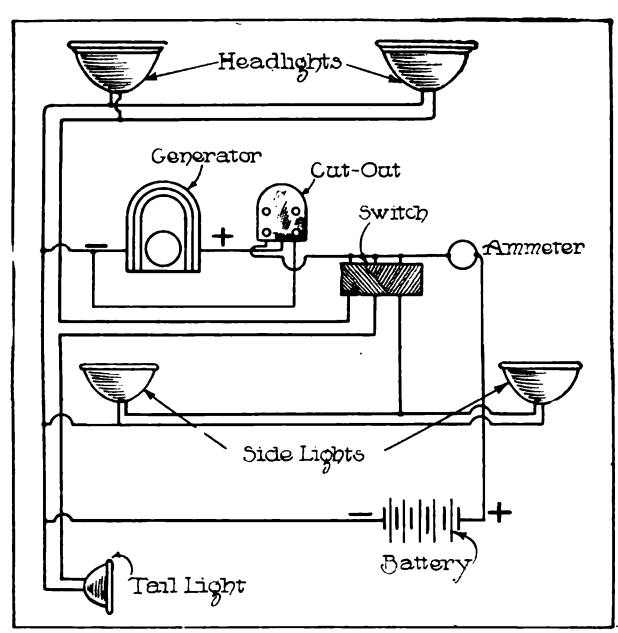

Fig. 126—Wiring Diagram of Perfection Lighting System in Which the Battery Is Floated on the Line.

tery, headlight dimmer and a safety lock switch. The generator is of special design and so constructed as to deliver the correct amount of cur-

Digitized by Google

rent at all speeds without the aid of mechanical or electrical devices. An electric valve is employed to prevent the battery discharging

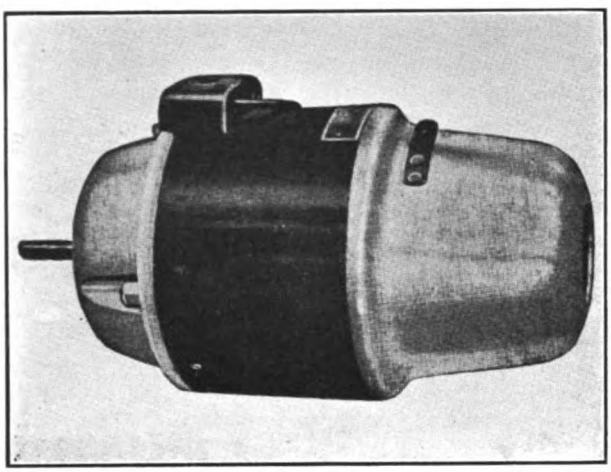

Fig. 127—The United States Lighting Dynamo in Which Governors and Clutches Are Eliminated.

through the generator when the latter is inoperative or its armature is rotating below the proper charging speed.

A feature of the equipment is a headlight dimmer, consisting of a resistance coil incorporated in the circuit. By pressing a button the brilliancy of the lamps is dimmed when approaching an automobile or other vehicle in an opposite direction. A safety lock device is employed, comprising a bank of individual switches in a unit case which may be locked by withdrawing a key.

The generator has but one moving part, the armature, and its capacity is 125 candlepower at six volts. The storage battery supplies current for starting and lighting and the unit is utilized as a motor for starting by simply moving a switch with the foot. The switch automatically returns to normal position and the machine then supplies current for lighting, etc. An automatic gear arrangement is employed with the motor starter which provides the proper gear ratios between it and the automobile engine. The maker claims a simple, compact, durable generator, one that is easily installed and an equipment that will provide efficient service.

THE AUTO-LITER.

With the Auto-Liter, manufactured by the Electric Auto-Lite Company, Toledo, O., the battery is employed as an auxiliary, the generator supplying current for the lamps and ignition above predetermined speeds of the automobile. The generator may be driven according to the convenience of installation.

The variable speed of the motor car is cared for by an automatic device incorporated in the generator. Discharge of the battery through the machine is prevented by an electrical device also in the generator. This cut-out disconnects the generator to the battery when the former is inoperative and closes the circuit when the proper charging voltage is developed. The battery supplies current to the lamps when the machine is idle. The equipment is very complete, including generator, terminal box, switch, ammeter, lamps, wiring, etc.

UNITED STATES LIGHTING DYNAMO.

In the lighting dynamo manufactured by the United States Light & Heating Company, New York City, governors and clutches are eliminated and the generator is driven at ratios depending upon those of the automobile motor. The dynamo becomes operative at a speed of 900 revolutions a minute, at which the proper current is developed, and the output remains constant irrespective of higher ratios.

This is secured by a regulator which is of the vibrating contact type. It is adjusted to operate at a certain voltage. When this starts to rise above a predetermined point the regulator automatically weakens the field just enough to check any departure from the natural voltage in

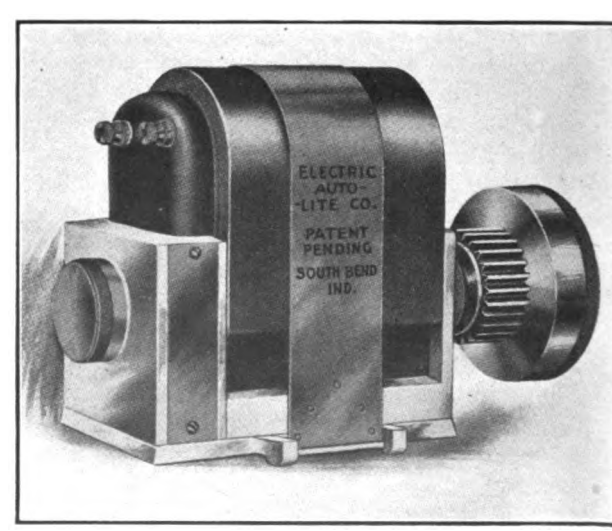

Fig. 128—The Auto-Liter Which Supplies Current to the Lamps, the Battery Being Employed as an Auxiliary.

its incipiency. When the voltage tends to drop below this value the regulator in the same manner strengthens the field. The device performs

Digitized by Google

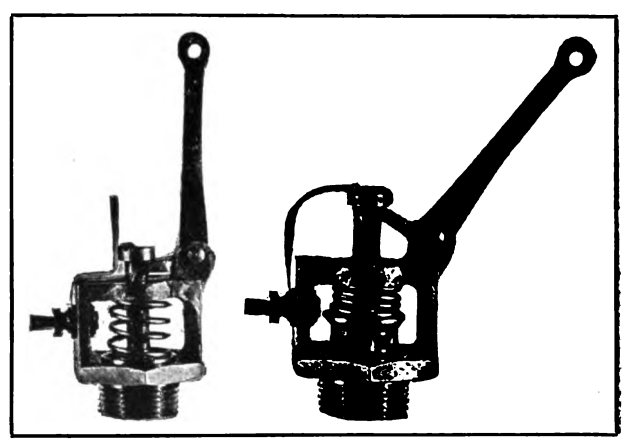
the function of an automatic switch and regulator.

The dynamo is bi-polar of the shunt wound type and its output is 15 amperes. The equipment is a modification of the railroad lighting systems manufactured by the company, which it claims will maintain a six-volt storage battery in a properly charged condition, as well as supply sufficient current for lighting and ignition purposes.

Although there are several lighting equipments being marketed which are not described and illustrated herein, their principles are similar to the systems already presented, and it would be largely repetition to give in detail their construction and operation.

NEW CLUB IN NEW YORK.

A plan meeting with much encouragement in New York City is the formation of the Automobile Club of New York, modelled on the lines of the automobile clubs of London, Paris and Berlin, to encourage and develop the trade; to secure through the co-operation of the trade the best advantages to automobile users; to provide a centre of information and advice on matters pertaining to automobiling and to establish a social club in the neighborhood of Columbus Circle with modern club facilities. Rooms may be taken in the United States Rubber Building at 58th street and Broadway. The organization, it is felt, is greatly needed and although it does not propose to conduct a supply department, it will effect arrangements with supply houses in the city so that members may receive certain advantages. The organization committee, through E. E. Schwarzkopf, will be composed of 50 leading members of the trade.



HUGHES TO RETIRE.

Word came from Milwaukee just previous to the Vanderbilt Cup and Grand Prize races that Hugh Hughes, head of the Mercer Automobile Company's racing team, would retire at the conclusion of those events. This is the second time that Hughes has "retired," having been out of racing for 1.5 years beginning in 1904. His reappearance was on the Indianapolis motor speedway, when he took the wheel on account of the regular driver's collapse. He has been in charge of the Mercer team for the past two years and has helped to win a large number of victories with cars of this make.

M & M CONTROLLER AND ECONOMIZER.

The advantages of cutting out the ignition and with the clutch in allowing the unexploded mixture to pass through and cool the cylinders when descending a grade are recognized by those familiar with gas engine operation. Under such conditions the motor acts as a brake, saving the linings of the latter. A device incorporating these and other principles of a similar nature is the M & M controller and economizer, manufactured by the Moller Bros. Controller & Economizer Company, 700 Betz building, Philadelphia.

It is a nickel plated device comprising a single valve and six port holes, and is designed for attachment to the intake pipe above the carburetor, the operation involving the tapping of a suitable opening. When the valve member is lifted from its seat, being actuated by a pedal, cool,

The M & M Controller and Economizer: At Left, Valve Closed; at Right, Air Port Holes and Device for Cutting Out Ignition.

fresh air is drawn into the cylinders. During the operation the throttle is closed, economy of fuel being effected and the speed of the car being checked by the motor as previously explained.

The controller is shown in an accompanying illustration and a notable quality is the provision made for cutting out the ignition. The wire of the magneto or other ignition member is led to the device and when the valve is opened contact is made, closing or opening the circuit, according to the system of ignition.

Another quality of the device is that starting of the motor may be facilitated, as a few drops of gasoline may be placed on the valve member, effectually priming the cylinders. In addition to the above features the M & M controller permits of regulating the mixture at differing speeds and under varying operating conditions without the driver leaving the seat.

MOTOR TRUCKS IN MASSACHUSETTS.

It will be remembered that the bill introduced into the Massachusetts legislature last spring, seeking to limit the size and weight of motor trucks operating on the highways of that commonwealth, was passed along to the legislature of 1913 for final decision. Considerable opposition to the bill was made manifest at the time, but it appears that those in charge of the matter were by no means satisfied that there was no need for such a law.

Announcement is made by the Massachusetts highway commission, which is understood to have looked with some favor upon the passage of the proposed act, that it will soon give the cities and towns opportunity to express their sentiment in the matter at hearings before the board. It is assumed, of course, that all interested parties are to have the same opportunity.

It is stated that several reinforced concrete bridges throughout the state, and particularly in the eastern portion, have suffered because of the heavier loads carried over them on mechanical transports. A portion of the through route between Boston and Fitchburg is said to have been closed temporarily on this account. Some of the bridges in the Berkshires also have suffered in a similar manner.

The situation narrows down to a question as to whether the towns and cities of the commonwealth shall rebuild their bridges to accommodate the modern method of transportation, or the extension of motor haulage shall be handicapped by certain restrictions. The automobile industry is interested because of the probable effect upon the future sale of motor trucks in Massachusetts, and possibly other states which feel inclined to follow its example. The general public should be interested, because past experience with mechanical transports has given abundant reason for believing that these vehicles represent an important factor in the solution of several economic problems.

FORD ON UNIFORM LEGISLATION.

Henry Ford, head of the Ford Motor Company, Detroit, in discussing the question of uniform motoring laws, sets forth his opinion as follows:

"If each state would but enact automobile laws regulating the speed at which the cars may be driven and then prohibit any secondary legislation by small towns or cities, the problem would be solved. A motorist would then be able to familiarize himself with the law, and would be able to meet its requirements if he desired. If he did not, then every owner of a car should be interested in getting the violator punished.

"When the townspeople see it no longer possible to harass the motorist by unfair laws and are assured that automobile owners in general are endeavoring to enforce the laws, then motorists will no longer drive many miles to avoid buying anything in the town, and the town in turn will make the motorist welcome."

A BRITISH WRITER'S VIEW.

Lord Montagu, editor of the Car, a British motoring print, who recently paid a visit to America, writes as follows in a recent issue of his magazine:

"In the United States there is at least one serious inconvenience to motorists which should be removed before long. Every state, and there are 48 of them, makes its own laws under which motor cars are run, issues its own orders as to speed limits and has a different system of regulations. In every state there is a speed limit, sometimes the same as and sometimes different from its

Digitized by Google

neighboring states. Needless to add, everywhere in America, as elsewhere all over the world, these speed limits are habitually disregarded, because they cannot be enforced."

MAINE WANTS GOOD ROADS.

At the recent state election in Maine the people voted to change the constitution so that it will be possible for the state to issue $2,000,000 in bonds for good roads work this year. Without waiting for this permission, some $700,000 has been expended for this purpose during 1912. There is little doubt that the present legislature will take cognizance of the people's desire in this matter, and that a substantial sum will be placed at the disposal of the highway authorities for 1913. It also is of interest to note that many of the towns have undertaken work of this nature without calling upon the state for aid. It is evident that Maine citizens desire better ways.

DEMAND UNIVERSAL LIGHTING.

At a recent meeting of the Sacramento Automobile Dealers' Association, Sacramento, Cal., a request was forwarded to the city commissioners and the county supervisors, asking for the enactment of a regulation requiring lights on all vehicles using the public streets and highways during the night season. This is in line with the activity manifested all over California, and it is probable that the matter will be taken to the legislature at its next sitting.

The Automobile Club of Southern California, in Los Angeles, already has taken the initial step in the latter move, and has requested the motorists throughout the state to aid it in bringing about a successful result to the campaign. The proposed law will call for one or more lights on all horse drawn vehicles, and if but one is to be carried, the placing of this on the left side, so as to determine the position of the vehicle at all times.

LICENSING OPERATORS.

There is abundant evidence that the legislatures of several of the states are to be called upon at their forthcoming sittings to take up the matter of licensing and examining operators of motor cars. It will appear from the accompanying table that very few commonwealths at present require anything in the nature of an examination from those who seek to drive as chauffeurs, and in most states the ownership of an automobile is held to be sufficient qualification for operation. Several seek to put an age limitation upon the driver. The whole situation is set forth in the table.

Irrespective of the demand for better regulation in this respect, motorists will do well to interest themselves in the bills which shall be presented for consideration. Organized motorists have been endeavoring to secure uniform motoring laws, and it would appear that there is ample opportunity to bring about such action in connection with this situation. If more stringent laws are to be passed, there is no reason why the several states cannot reach a common ground upon which to base their provisions. It may result in a readjustment of other sections looking toward a proper uniformity, if the matter is given sufficient attention at this time.

MAY REPEAL WHEEL TAX.

Repeal of the wheel tax is being urged in Washington, D. C., and as the tax commissioners and assessors have sent a bill to Congress for this purpose, it is anticipated that the present regulation will be removed. The system is held to be cumbersome and excessive, the motorist being taxed on no less than four counts, or five if he wishes to operate a taxicab. It was put into effect in 1909 and immediately aroused considerable protest. The law was sustained in several test cases, however, and until the present there has been very little hope of its repeal.

PITTSFIELD TYPE N. B. MAGNETO.

The Pittsfield type N. B. magneto, made by the Pittsfield Spark Coil Company, Dalton, Mass., differs from those previously described in that the current is generated in a stationary coil without any moving wire on the armature. In other words, a stationary winding is utilized and mechanical energy is transformed into electric power through a distinctive principle depending upon induction. The magneto is of the true high-tension type and each revolution of the armature produces two sparks which are distributed to the proper cylinders by means of a high-tension distributor.

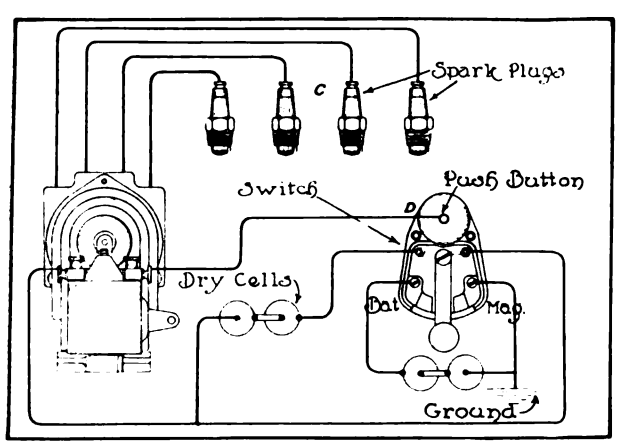

Fig. 1—Wiring Plan of Pittsfield Dual Ignition System with Push Button.

At Fig. 2 is presented a longitudinal cross section of the magneto; also a lateral section. It will be noted that the inductor or armature is composed of laminated iron sections which revolve through a magnetic field formed by permanent steel magnets. The winding instead of being located on the armature is placed on the back of the instrument, is stationary and may be removed easily and a new one substituted if necessary without disturbing other components. It is a transformer in that it contains both the primary and secondary windings.

Construction of Magneto.

The magnetic field contains four poles, two of which are the poles of the permanent magnets as illustrated. The other two poles with the iron core comprise the field. The rotation of the armature generates in the winding of the coil an alternating current which during each revolution attains a maximum spark for ignition. One end of the primary winding is connected to the field by a contact button, as shown, and its other end is attached to a contact plate which is screwed on the field and insulated by a hard rubber plate and bushings. Connection from this plate to the platinum contact piece and screw is made by a brass contact piece. The latter is insulated from the interrupter plate which is in metallic connection with the field or ground.

The platinum screw on the lever is held against a platinum pointed screw by means of a spring and the lever is connected with the field. The current generated in the primary winding is therefore short circuited as long as the two platinum members are in contact. The primary circuit is interrupted when the cam actuates the lever, separating the points.

One end of the secondary winding is connected to one end of the primary, and the other end is led to a conductor by means of a metal bridge. The secondary or transformed current is led from this bridge member to the distributing brush by means of two insulated conductors which are connected by means of a carbon brush and spring. In the distributor plate are four socket inserts, connected to four distributing segments. During the rotation of the distributor gear a brush comes in contact with these segments in proper rotation and as a wire leads from each of these members to the spark plug, the high-tension current is distributed.

Digitized by Google

Installation and Adjustments.

The four-cylinder type of magneto must be driven at crankshaft speed when fitted to a four-cycle motor. The construction of the instrument is such that the interrupter, which is screwed on a sleeve, may be easily removed. In replacing the part care should be taken to note that the screws are tight. The openings of the platinum points should be about .015625 inch when open and adjustment is made by means of the platinum screw member. It should be remembered that the primary circuit is interrupted or broken twice for each revolution of the armature by means of the lever.

To time the magneto: The piston of the first cylinder should be on dead centre or top of the compression stroke. The distributor cap is next

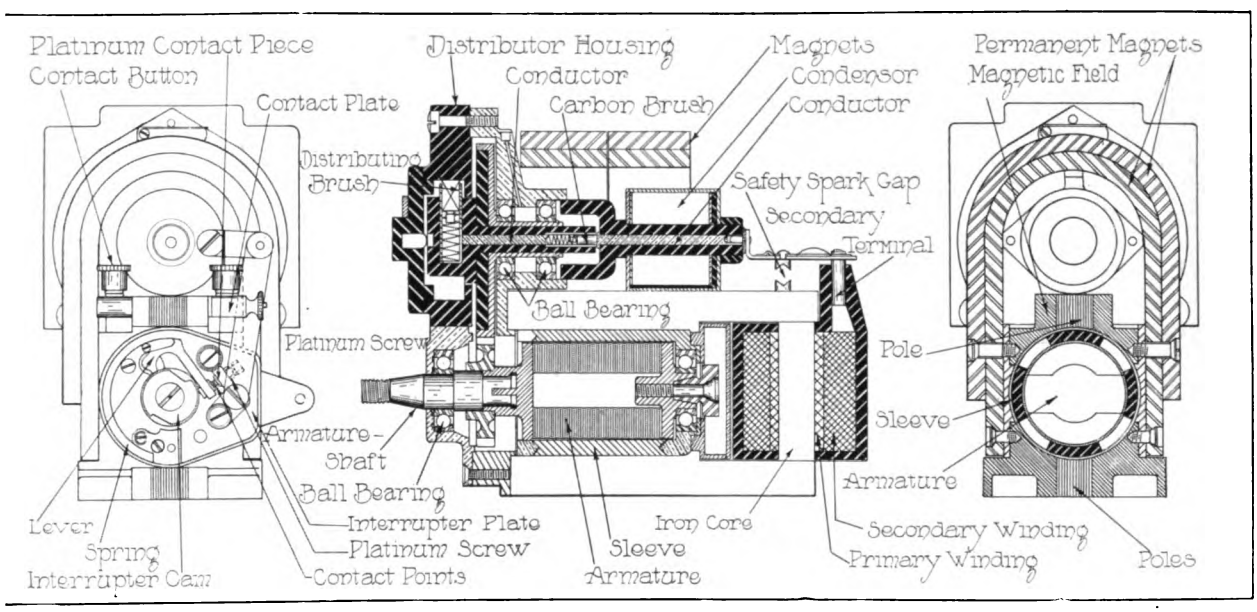

Fig. 2—The Pittsfield Type N. B. True High-Tension Magneto, Illustrating Components of Interrupter Mechanism, Longitudinal Cross Section Showing Components, and Lateral Section.

removed by pulling outward on the knurled knob and by lifting the brass yoke. The armature is then rotated until the line on the brush holder is directly under the line marked on the distributor plate. The coupling or connection member between the magneto and motor is then secured. Assuming that the terminal of the distributor is marked one, the cable from this should be attached to the spark plug of the first cylinder. The remaining wires are connected according to the firing order of the motor, either 1, 2, 4, 3 or 1, 3, 4, 2. It must be borne in mind, however, that the direction of the distributor arm must be observed; that is, whether it is clockwise or anti-clockwise, and the connections made in the proper firing order of the motor. For example: With the motor firing 1, 2, 4, 3, the first two contacts would be connected to the first and second cylinders, but the third segment will be connected to the fourth cylinder.

With motor firing 1, 3, 4, 2, the second segment would be connected to the third cylinder, the third to the fourth cylinder and the last to the second.

Short Circuiting Magneto.

The magneto is cut out by short circuiting the primary circuit. This is accomplished by the switch lever, but in the event the motor fails to stop when the lever is thrown to "off," the ignition may be cut out by connecting a wire from the primary terminal, which is on the contact plate member, and touching the other end of the lead to any metal part of the chassis. This grounds the current, an operation performed by the switch, as it will be noted that in practise a wire is led from the terminal to the switch. Unlike the battery and coil type of ignition, the current of a magneto flows to the plugs only when the switch is open, which is indicated by the lever being placed at "magneto" at which time, however, the primary circuit is established.

The bearings are a high grade ball type, but the maker points out that they should be lubricated about once a month with a few drops of oil, the places being marked upon the instrument. If the skipping of a cylinder is thought to be due to faulty operation of the magneto, the latter may be tested easily by removing the cable from the plug, and with the motor running, holding the

Digitized by Google

terminal about .1875 inch from any metal part of the engine. If a bright, hot spark passes it will denote that the magneto is not at fault. If not the breaker box mechanism should be examined to see if the platinum points open and close when the cam passes under the rocker arm, and that the opening is about .015625 inch. The method of reaching these members has been explained. If the motor fails to run upon the magneto the wire leading from the primary terminal to the switch should be gone over carefully, as it may be chafed and in contact with some metal, creating a short circuit. A simple test is to remove the wire from the terminal.

Dual System.

The Pittsfield Spark Coil Company also manufactures the type NBD magneto, designed for ignition purposes and to be utilized in connection with dry cells, a system making it possible to start the motor upon compression, or upon the spark, by the pressing of a push button incorporated in the switch. The wiring plan is presented at Fig. 1 and it will be noted that one end of the primary winding is connected to the interrupter and the other to the lever of a three point switch, and with the lever on the "magneto" side the magneto operates as a high-tension instrument. When the lever is moved to the "battery" the primary lead is connected to the proper pole of the dry cells and the current from these assists that of the magneto when the latter is operating at slow speeds. In connection with the installation of dry cells the company emphasizes the warning that not more than two batteries be employed, as sparking at the platinum points is not desirable.

ANTI-FREEZING SOLUTIONS.

In the majority of instruction books accompanying the automobile, the novice will, if he reads carefully, note a paragraph devoted to anti-freezing solutions. For example one maker states, "Whenever the temperature approaches 40 degrees Fahrenheit above zero, the cooling system should be made frost proof by mixing a non-freezing substance with the water." Unfortunately there are some who although having read the warning do not heed it because the paragraph is either forgotten or the book mislaid by the time cold weather arrives.

Although mild weather has been noticeable the time is fast approaching when freezing temperature will prevail and for the benefit of the novice as well as experienced motorist the various formulae for anti-freezing mixtures, as well as suggestions for utilizing them, are given herein. Those who make it a practise to motor to the country to spend the week end and where the machine is likely to be exposed to the elements, will do well to either drain the water from the circulating system or to employ solutions which will withstand temperatures well below the freezing point, 32 degrees Fahrenheit. And it may be stated that the cost of such a solution is but a few cents while that of replacing a burst radiator, cracked cylinders and other components of the cooling system may mean an expenditure of several hundred dollars.

Some authorities do not approve of the use of anti-freezing solutions, holding that they are detrimental to the metal parts of the cooling system. There is no doubt that alkaline solutions, which are electrolytes of high potential, produce electrolytic action whenever two metals of different potential are employed together, as the brass tubing of the radiator and the solder at the joints, the aluminum or brass flanges closing the core print holes of the cast iron cylinders, etc. But where the car is exposed for any great length of time or stored in a garage not equipped with heating facilities, some solution is essential if the machine is to be maintained in service.

Materials Employed.

Among the ingredients utilized are alcohol, glycerine and calcium chloride. The first two named may be combined but the calcium chloride is not mixed with other than water. In accompanying tables are presented formulae for mixing the different ingredients and the freezing points of each at various temperatures are also given.

Calcium chloride is favored by many because of its low cost and in its pure state occurs in prismatic crystals soluble in one-quarter of its weight in water, and easily so in alcohol. The commercial form contains about 50 per cent. water of crystallization, and dissolves in half its weight in water. It costs approximately 10 cents a pound. In preparing the mixture it is well to have several strips of blue litmus paper for testing. If it changes the color of this toward a red, the compound is slightly acid and should be corrected by adding small quantities of milk of magnesia until the color remains unchanged.

Alcohol and Glycerine..

An anti-freezing solution, the basis of which is denatured alcohol, is easy to prepare as it does not involve any other work than pouring it into the radiator when the motor is running. Given

Digitized by Google

the capacity of the cooling system it is a case of simple mathematics to ascertain the proper quantity of alcohol and the freezing temperature, as will be noted by a glance at the accompanying table. Denatured alcohol retails at about 60 cents a gallon and two quarts when mixed with the water of the average cooling system will withstand temperatures as low as 18 degrees above zero.

Evaporation of Alcohol Mixture.

Alcohol boils at 172 degrees Fahrenheit, water at 210, and when a solution is prepared to withstand zero temperatures, it will heat more easily than water and on mild days the rising of its temperature is apt to cause evaporation. It is an excellent plan to purchase a hydrometer, which is inexpensive, and test the mixture from time to time, renewing with alcohol when the freezing point is raised above that desired.

A combination of glycerine and alcohol provides a good mixture in that it will not heat readily as the former does not boil until it reaches a temperature of 554 degrees Fahrenheit, and even with the addition of alcohol it is obvious that used with equal parts of water and alcohol its boiling point is above that of the other ingredients. Glycerine costs about $2.50 a gallon and when employed the water connections should be overhauled and made as tight as possible to eliminate glycerine "creeps," the analogy being the creeping of the electrolyte on the terminals of a storage battery. This deposit does not evaporate and dry up, but rather increases after it has been in use a time.

Expansion of Mixtures.

In the preparation of these mixtures allowance should be made for the expansion of the fluid by heat. If the radiator be filled to the top and the car operated on a mild day, the mixture will heat and expand, causing loss of fluid by means of the overflow pipe, a condition some operators do not consider. It is a good plan to make allowance for this action.

Previous to the preparation of the mixture the members in which it is to be utilized should be cleaned thoroughly to remove any alkali or sediment that may have accumulated. This may be accomplished by opening the petcocks at the lowest point of the system and inserting a hose in the opening of the radiator. Then, with the motor running, allow the fluid to circulate from 10 to 15 minutes. A more thorough method is to utilize a solution made from common washing soda in warm water until the latter will not dissolve any more of the crystals. The mixture is poured into the radiator and the engine run for at least half an hour, after which the solution is removed and the system cleaned with fresh water, which is circulated and removed.

Before employing an anti-freezing solution any leaks should be repaired, as an alcohol mixture when heated will find its way through tiny openings which may not have leaked when water was employed or because of the incrustations or deposits. The proportions in the mixture decided upon must be governed by conditions of locality, of course, but it is better to be safe than sorry, and make the solution strong enough for the extremes that may be expected.

ADDITION TO CUTTING FACTORY.

The Cutting Motor Car Company, Jackson, Mich., formerly known as the Clarke-Carter Automobile Company, has decided to enlarge its plant again, having discovered that its manufacturing facilities, recently enlarged, are decidedly inadequate. Arrangements have been made to double the size of the plant and additional land adjoining the factory has been purchased for that purpose. The new plant will be in the course of erection by next spring.

The accompanying illustrations set forth in a general way the changes which mark the 1913, six-cylinder, 45 horsepower Napier, made by S. F. Edge, Ltd., London, England. It may be stated, however, that only such differences have been incorporated as experience has dictated were desirable and in appearance the model for the coming season is much the same as for 1912.

The cylinders are cast in pairs, with bore of four inches and stroke of five, giving a rating under the R. A. C. formula, which is the same as that of the S. A. E., of 38.4 horsepower. Particular attention has been paid to the matter of spring suspension, the members being very long, and with triple suspension at the rear. The wheelbase has been lengthened by four inches and is now 138 inches. The specific features, to which attention is directed by the maker may be set forth as follows:

Forced feed lubrication is provided. The pump is driven by a spiral gear from the camshaft and works in oil. This takes the lubricant from the aluminum sump R through the suction pipe S, and drives its under pressure through the delivery pipe and suitable leads to the crankshaft bearings, crankpins and big ends, while the distribution gear is lubricated by jets of oil impinging on the teeth of the gear wheel at their points of meshing. The surplus flows back into the sump through the adjustable bypass T.

Pressure is maintained in the gasoline tank, carried below the rear of the chassis frame by a plunger air pump W, driven off the camshaft. This is fitted with an inlet and non-return outlet valve, and the open end X of the air suction pipe is covered with a gauze cap to prevent the ingress of dust.

The carburetor is fitted with an hydraulic air regulator, control being by hand lever on the steering wheel and a throttle pedal placed outside the brake pedal. Cooling is by water, the rotary pump G being driven off the distribution gear. Two systems of ignition are provided, one being by enclosed Bosch magneto, also driven off the distribution gear, and the other by the Napier synchronized battery system. The distribu-

tor is enclosed in a little box, 3.5 by three inches, on top of the motor, and its flywheel is driven off the camshaft by means of a steel spindle in an aluminum housing.

Power is transmitted through the multiple disc clutch, running in oil, and double universal joint to the three-speed transmission. The propeller shaft has a universal gear at either end and the road wheels are rotated through a bevel type of differential. The driving shafts rotate in ball bearings and the axle casings have a double row of ball bearings.

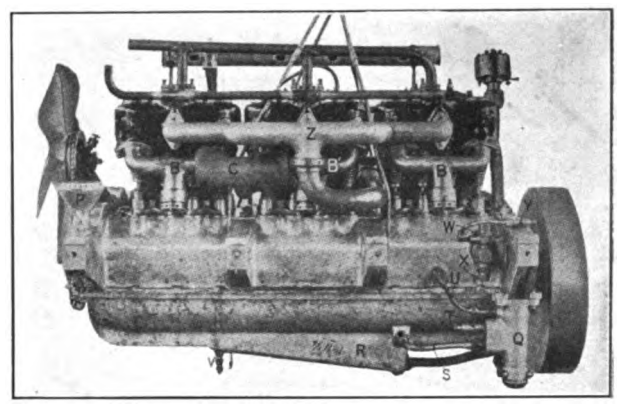
E. Lascaris, the well known automobile importer, who has recently returned to this country after a long tour abroad, states that there are now 2800 motor omnibuses in operation on the streets of London and that 2000 more will be add-



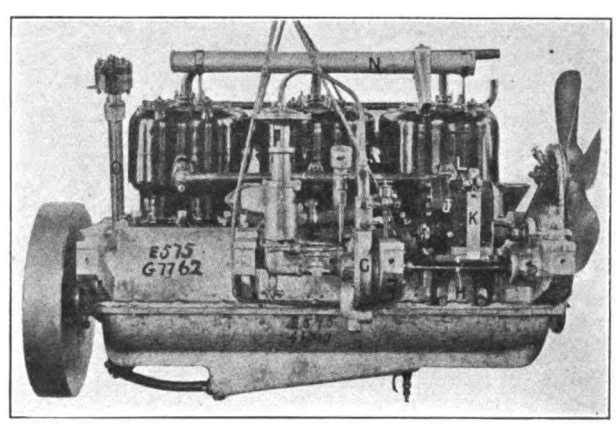
Front View of Napier Chassis for 1913.

ed during the next 12 months. He reports a similar growth of the use of motor vehicles in all the large cities of the United Kingdom and throughout all Europe. He says that in the European and English capitals they are recognizing motor passenger vehicles as superior to street cars, as they eliminate the tracks which destroy street surfaces and dispense with much of the noise attendant on the operation of street cars. The first outlay is much less and the profits from them are large.

—— ★ ——

Operating taxicabs around the pyramids is the work undertaken successfully by H. G. Corriffian of Cairo, Egypt, who recently made a visit to the plant of the Hudson Motor Car Company, Detroit, maker of Hudson cars. Mr. Corriffian is an Armenian and after being expelled from Turkey came to America, where he graduated from Harvard University, after which he went

Inlet Side of Napier 45 Horsepower, Six-Cylinder Motor.



to Detroit and purchased Hudson cars for the service he had in mind. He credits these cars with having been instrumental in opening the Egyptian field to American made automobiles.

—— ★ ——

L. Coatalen of England in a 15.9 horsepower Sunbeam car recently established a new world's record for 400 miles, his time being 5:05:53. He also made new marks for four hours, travelling 319 miles, 242 yards, and five hours, covering 391 miles, 1429 yards.

—— ★ ——

The success of the British cars in the recent French Grand Prix has resulted in concentrating attention once more to the question of road racing in England and a general movement has been started to revive the races which were formerly held on the Isle of Man. It is denied that when racing was abandoned it was due to the opposition of the late King Edward VII, to whose attention the matter was never brought it is claimed. The agitation against reckless and high speed motoring of several years ago has

Ignition Side of Napier 45 Horsepower, Six-Cylinder Motor.

subsided and the Isle of Man has asked for another race. Many of the firms established during the past five or six years are anxious to demonstrate the value of their cars and it is expected that the Royal Automobile Club will arrange for a revival of the Isle of Man series next year.

—— ★ ——

In New South Wales the police department is very strict and before a car can be registered the brakes are tested on a steep hill and the steering gear is searched for loose connections and any bolts that may not have been pinned. The reason for this is that failure of brakes to act or of steering gear to respond is no excuse for accident; any officer who suspects shortcomings in any car traversing the streets has power to stop such car and examine the parts, taking proceedings if necessary.

—— ★ ——

Relative to the invasion of the Australian automobile market by American manufacturers, the British trade commissioner comments as follows: "There is no disguising the fact that the United States manufacturer has come in as a serious competitor during the last 12 months. The American manufacturer of both motor cars and buggies which reach the consumer here at a cost of under $1500 has met with a considerable amount of success. This competition is not confined alone to the cheapest class of cars, however, as it is understood that the United States manufacturers are cutting into the trade for cars up $2500 and $3000. Buyers state that the American cars are lighter, have greater clearance from the ground than those of United Kingdom origin, are cheaper to operate both in respect to the gasoline used and the wear and tear of tires, and the capital outlay, car for car of the same power, is said to be far less for cars of American manufacture."

—— ★ ——

Hermes da Fonseca, president of Brazil, has purchased a luxurious six-cylinder Pope-Hartford car, made by the Pope Manufacturing Company, Hartford, Conn., for his personal use in and around Rio de Janeiro. Several makes of cars were exhibited to the president and he chose the Pope-Hartford after tests had been made.

—— ★ ——

Although business in automobiles in Sicily during 1911 was below general expectations, chiefly because wealthy people passed their vacations away from Palermo, the popularity of the automobile increased and the number of cars sold exceeded that of 1910. While the Ford was the only American car handled in Palermo in 1910, the year 1911 brought the Overland, Hupmobile and Regal, and during the current year the Reo and Flanders are being offered in that market. Observation shows that there is a marked tendency to favor a durable medium or low-priced automobile and the American machine has been found to combine just such qualities.

—— ★ ——

Ontario's revenue last year from the sale of licenses for motor vehicles totalled $50,831.25, twice the amount received during 1910, which was $24,394. The revenue for 1906, the first year fees were imposed, was only $15,235.15. Fees collected last year for issuing charters to automobile corporations totalled $235,663.10.

Built Two-Cylinder Models.

(1444)—Did the maker of the model T Ford ever build any other cars than the present model and the six-cylinder machine? I had an argument with a friend who states that the company made three models of two-cylinder automobiles. Which is right? ARGUMENT.
Toledo, O., Oct. 11.

The first car produced by the Ford Motor Company was a two-cylinder machine with horizontal, double opposed type of cylinders, having a four-inch bore and stroke and rated at eight horsepower. The car was known as the model A, had a wheelbase of 78 inches and was made in the runabout type and with a tonneau.

It was followed by the models called A C and C having the same type of motor, but the latter was rated at 10 horsepower having a bore and stroke of 4.25 inches. Both models were equipped with a planetary transmission and single chain drive. Some of these cars are in service today.

Another two-cylinder car was known as the model F. It had a horizontal, double opposed motor located under the body amidships, and a bore of 4.5 inches and stroke of four. The horsepower was rated at 12. The wheelbase was 84 inches and the transmission planetary with single chain for final drive. The tonneau was of the detachable type.

About the same time the company brought out a four-cylinder touring car with the cylinders cast singly and having copper water jackets. The bore was 4.25 and stroke 5.25 and although rated at 20 horsepower was 28.9 according to the S. A. E. formula. Drive was by shaft and a planetary transmission was employed.

The model was followed by the six-cylinder touring car and roadster and about the same time the company produced a four-cylinder runabout selling for $500 which occasioned considerable interest in manufacturing circles. This model was succeeded by a four-cylinder roadster and later by the present model T.

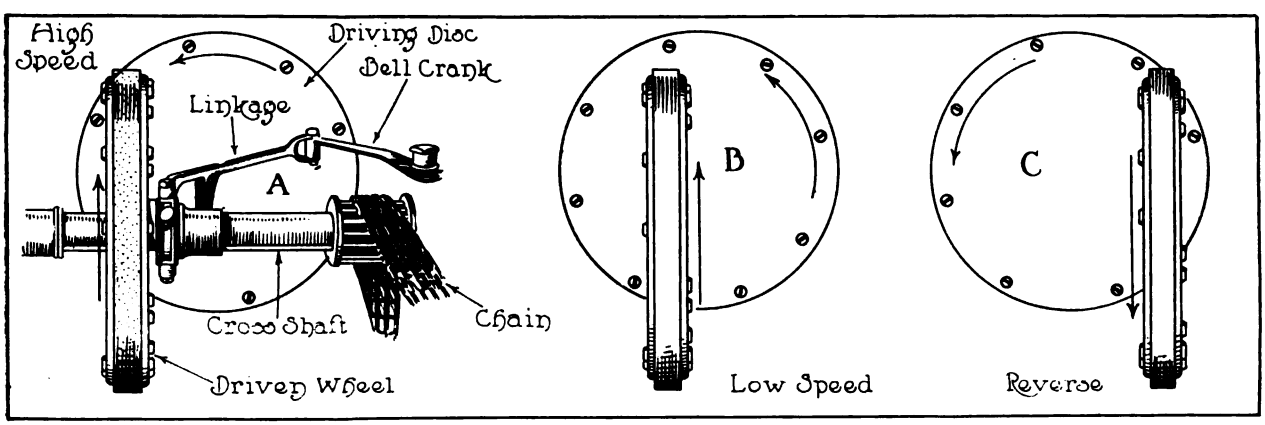
Lambert Friction Drive.

(1445)—Will you kindly explain how the Lambert friction drive car gets so many changes of speed without using gears? Also how the clutch is disengaged? Would one of the pleasure cars be practical for a delivery machine in service where the roads are sandy?
W. K. WHITE.
Kansas City, Mo., Oct. 13.

The friction drive is very simple and the principle is an old one. Coupled to the flywheel by a telescopic connection is the driving shaft actuating the driving disc. These components are mounted upon a substantial cross member, providing a firm anchorage. The connection with the flywheel and the driving shaft is made by the telescopic coupling referred to, which eliminates all end thrust upon the crankshaft of the motor. The telescoping of the shaft into the square part of the female half-coupling makes a perfect connection and the utilization of heavy gib bolts insures rigid contact of the shaft and coupling. This coupling is essential as well, because of the frictional adjustment, which is accomplished by loosening the gib bolts and moving the shaft in or out of the coupling, this affording the desired clearance between the driving disc and the driven wheel.

At the rear of the driving shaft is mounted the driving wheel or disc. It is constructed of aluminum with one side made smooth and even, and with the other webbed to give strength and lightness. This driving wheel, which is shown at A in an accompanying illustration, is perfectly balanced and is so designed that no matter where the pressure may be exerted with reference to its face the load does not cause a special stress upon the journal in which the shaft end is mounted.

The driving disc is coupled to the driving shaft and the shaft is moved slightly forward or backward to either clear or engage with the driven wheel, which is mounted upon a cross shaft. A large thrust bearing is installed just forward of the driving wheel and back of the frame cross member. The thrust bearing also permits free movement of the shaft under any circumstances and is completely enclosed.



At right angles to the main driving shaft and parallel to the face of the driving disc is mounted a cross shaft. This cross shaft carries at the right end a sprocket. On the cross shaft is mounted the driven wheel, and this may be moved on the shaft crosswise of the chassis frame, being actuated by a bell crank and linkage operated by a lever convenient to the driver.

Normally the position of the driven wheel may be assumed to be in the centre with reference to the face of the driving wheel. This driven wheel periphery or face is normally just clear of contact with the face of the driven disc. The driven wheel when not in contact is in a position that

Digitized by Google

corresponds to neutral with the conventional forms of gear transmission. By a pedal movement the driving wheel is forced backward to contact with the driven wheel and if the edge of the driven wheel touches the driving wheel just at the left of the face centre the lowest speed is obtained, for the driving wheel may be revolved at high speed and the movement of the driven wheel is correspondingly slow. The speed is illustrated at B, the arrows indicating the direction of rotation of both wheels.

When the driven wheel is moved to the left and engaged with the driving member, the velocity of the former is increased until it will be revolved with the same velocity as is the driving wheel, which is always at engine speed. With the wheels as above stated the high speed would be produced as shown at A. Moving the driven wheel from centre to the left affords numerous ratios of forward speeds as may be desired.

Illustrating the Application of the Friction Drive: A, Showing Driving Wheel and Driven Disc in the High Speed Position; B, Indicating Low Speed; C, Position of Driven Wheel When Reverse Is Desired.

At C is shown how the reverse is secured, the arrows indicating the direction of rotation of both members. With the driven wheel moved to the right of centre the direction of rotation of this member will be changed. The driving disc always rotates in the direction of the arrow and when the edge of the driven disc is brought in contact with the driving member the right side of the latter is moving upward, imparting an opposite movement to the driving wheel. This is similar to the direction of rotation of the rear and front wheel of two different bicycles travelling in the same direction, one back of the other. The extreme rear portion of the rear wheel of the first machine is moving up while the extreme front of the wheel of the following bicycle is moving down. If the periphery of the two wheels were brought together the contact would check the front wheel of the rear machine and tend to cause it to rotate in the direction other than it was travelling. This condition is well known to bicycle riders and many have experienced falls by running too close to the rear wheel of another machine.

There is no reason why the automobile referred to could not be successfully converted into a delivery car. With the large number of speeds secured through the friction drive, it is obvious that sandy roads could be negotiated easily. And it may be mentioned that this company manufactures commercial vehicles especially designed for the work they are expected to accomplish, also employing the friction drive.

Voltage of Lamps.

(1446)—I have a model T Ford car and have converted my gas headlights into electric members. Of late have been experiencing considerable trouble by burning out the bulbs. Those recommended by the company from which I bought the outfit did not give me light enough at low speeds so I purchased and fitted smaller lamps. Is there any method of regulating the current so that the lamps will not burn out? SUBSCRIBER.

Milford, Mass., Oct. 21.

The cause for the filaments burning out is that the voltage of the magneto exceeds that of the lamps at high speeds. The generator of the car referred to develops considerably more current at high ratios than at low and the lamps recommended by the concern manufacturing the equipment should be employed.

The J. & B. Manufacturing Company, Pittsfield, Mass., markets a lighting regulator which is a compact little device and which it is stated will so control the current that a steady, brilliant light is obtainable at high or low speeds. It is installed easily and does not require the services of an electrical expert, as the fitting of the device requires but the connecting of the wires of the magneto circuit to the marked terminals.

Lighting Capacities of Batteries.

(1447)—I have a pair of 40 ampere-hour capacity ignition batteries, one of which I use for starting my car. Am contemplating fitting electric lights and would like to know what size bulbs to employ and how much service I could obtain from one of the batteries. My plan was to use one while the other was being charged. How are the capacities figured; that is, how many hours lighting would one battery give? ELECTRICITY.

Hartford, Conn., Oct. 14.

The term ampere-hour is employed to denote the capacity for current of a storage battery in a closed circuit. A storage battery that will keep a two-ampere lamp burning for eight hours is said to have a 16 ampere-hour capacity. In a similar manner an 80 ampere-hour battery would operate the same lamp 40 hours. The voltage does not enter into the calculation of the ampere capacity.

The term wattage or watts is now employed in lamp ratings, although candlepower is still referred to by the makers. Regarding the term watt-hour, it may be stated that a current of one ampere flowing in a closed circuit, with an electromotive force of one volt, is equal to one volt-ampere or one watt. The voltage of the circuit multiplied by the rate of current flowing in amperes, gives the rate of work or energy expended in watt-hours. Therefore one volt multiplied by one ampere may be stated to be equal to one watt.

It is not necessary to utilize all these units in computing battery and lamp capacity and to simplify matters the ampere and watt may be employed. The voltage may be eliminated insofar as the straight storage battery system of lighting is concerned, as the majority of lighting batteries are rated at six volts.

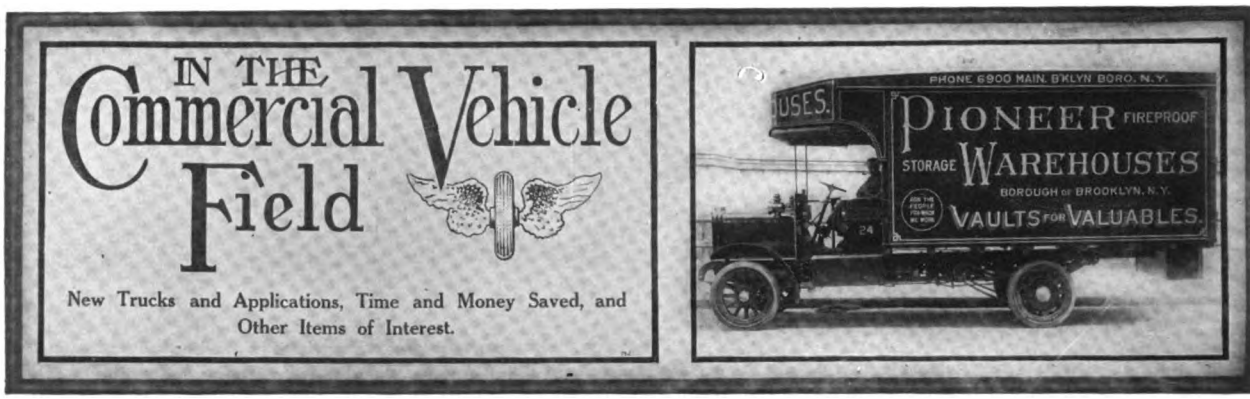
It will be noted that the lamp catalogues give the mean horizontal candlepower in fractions, and the total watts vary from the given figures slightly. For instance, a Mazda six-volt lamp is listed as having a mean horizontal candlepower of 6.1, and the total watts are given at 7.5. These differences, however, are small. The Mazda lamp, it may be stated, is a form of tungsten.

Assuming that the lamp equipment for the car consists of two 10 candlepower headlights, two four candlepower side lights, and one two candlepower tail light, the entire equipment, aggregating approximately 31 watts, a 120 ampere-hour six-volt battery would give 23 hours continuous lighting.

To simplify matters, let it be assumed that one ampere is equivalent to six watts, inasmuch as it has been explained that an electromotive force of one volt with a current strength of one ampere is capable of developing an amount of energy called a watt. Having ascertained the number of watts, the sum divided by six would denote the number of amperes utilized. Various groups of lamps may be computed on the same basis. The accompanying table will give approximately the candlepower of lamps, amperes and watts.

C. P.	Amperes	Watts	C. P.	Amperes	Watts
2	0.3	2.46	4	0.6	4.92
6	1.0	7.38	10	1.6	12.30
16	2.4	14.76	20	4.0	24.60

The storage battery referred to is not adapted to lighting purposes in that it is designed for a slow discharge rate. Another disadvantage is that 40 ampere-hour capacity would not supply a group of five lamps or the headlights and tail lamp with current for any great length of time. The writer knows, however, of a motorist who employs batteries similar to those mentioned for operating the side and tail lamps and he states that he has not as yet experienced any battery trouble. It is advisable, however, to employ a lighting battery and one of 120 ampere-hour capacity would be productive of more efficient service.



THE COLE BLUE BOOK.

A departure, and a pleasing one, from the usual motor car catalogue is noted in the Cole "Blue Book," copies of which have just been mailed to the Cole owners and trade. Not only is the book well printed, but its contents teem with facts about automobiles in which the motorist is interested. Enclosed by a blue cover, bearing the coat of arms of the Cole Motor Car Company of Indianapolis, Ind., the "Blue Book" contains handsome illustrations of the different models produced by the company as well as components of the chassis. It is the product of Homer McKee and his method of handling his subject is not only original, but extremely interesting. His instructions as to care and maintenance are valuable to the experienced as well as new owner.

NEW WHITE TOWN CAR.

The White Company, Cleveland, O., maker of White pleasure and commercial vehicles, has now on exhibition at its Boston showrooms one of its newest models, the 40 horsepower town car. The coupe, which embodies all the traditional excellence of White design and finish, is particularly suited to the requirements of the woman driver, equipped as it is with the electric starting and lighting system and the left side drive.

ONE-TON TRUCKS EXCLUSIVELY.

It is maintained by the Federal Motor Truck Company, Detroit, that it is the largest exclusive maker of one-ton trucks in the world. Inasmuch as this is held to be an age of specialties and specialists, the Federal company naturally takes much pride in this rating, and the idea is carried out in every department. Constructing but one model, the company claims that it is thus possible to produce a fully guaranteed vehicle at a low price.

The Federal is built in two sizes, model C having 110-inch wheelbase and model D 114. The former is equipped with bodies designed for conveying small articles of heavy weight, and the latter for carrying large bulky loads, such as furniture, etc.

These vehicles are represented in over 100 different lines of business and are giving satisfaction in every detail. These lines also include chassis fitted with motor 'bus bodies, and the new combination chemical engine and hose wagon for fire department service is also manufactured.

During the past two years Federals have been distributed widely throughout the United States and a great many have been shipped to foreign countries. The output for 1912 will be over 1000 cars, and the orders and repeat orders for the coming season indicate that between 2000 and 2500 will be needed to supply the demand for 1913. Herewith is presented a portion of the fleet of 60 Federals taking part in a recent motor truck parade in Detroit.

KNOX FOR COAL DELIVERY.

The Citizens Coal Company, Waterbury, Conn., has put in service a large five-ton Knox truck with trailer, made by the Knox Automobile Company, Springfield, Mass. for delivery of coal orders throughout the city and neighboring territory. The machine has solved the problem of hill climbing with heavy loads. The trailer is equipped with extension chutes having three partitions so that different grades of coal can be kept separate and delivered on the same trip.

Portion of the Fleet of Sixty Federal Trucks Making Up a Section of a Recent Parade in Detroit.

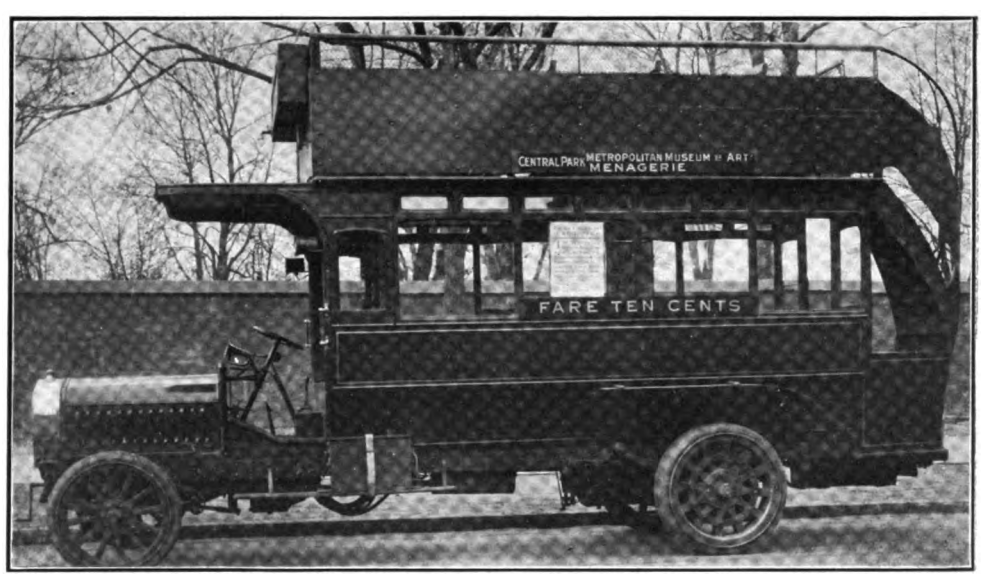
GASOLINE-ELECTRIC OMNIBUS.



As is more or less well known, gasoline-electric omnibuses have been in operation on Fifth avenue in New York City for the past three years, and have met every requirement of the service in a satisfactory manner. An accompanying illustration presents one of these vehicles, and it will prove of interest to consider the mechanical features, the electric equipment for which was made by the General Electric Company, Schenectady, N. Y. This car represents the latest development along this line.

The chassis frame is of double armored wood with pressed steel cross members, and the subframe from the engine and generator has three point suspension, which arrangement is held to relieve the motive unit from undue twists and strains. Transmission from the motor countershafts to the driving wheels is by the regular De Dion system of drive to rear axle, an electric automobile motor being substituted for the gearbox.

Long half-springs support the body at front and rear, making for easy riding qualities. Steering and driving wheels are of the artillery type, 34 and 40 inches diameter, respectively. The tire equipment consists of four-inch solids in front and 3.5-inch dual solids in the rear. The wheelbase is 168 inches.

The gasoline engine used to drive the generator is of the De Dion make, a four-cycle, four-cylinder unit. The generator is a six-pole machine, each pole being slotted on the entering side, forming a small auxiliary pole, about which most of the series turns are wound. By saturation of this tip, series excitation is limited, and a drooping characteristic is the result. A further effect of the saturation is to give a good commutation at times when the field otherwise is weak. Several series turns entirely encircle the pole, the shunt winding being placed over all. Here is, in effect, a commutating pole generator, with high overload characteristics and fine commutation at all loads, which is quickly self-exciting, and at the same time of light weight, according to the maker.

This machine is known as the TD-6-7.5 kilowatt generator, and is rated at 125 volts, 60 amperes, at 900 revolutions a minute. It is claimed it may be run at 100 per cent. overload for two hours with 70 degrees C. rise of temperature, and at 50 per cent. overload continuously. It has an efficiency of 85 per cent. at normal load and weighs about 500 pounds. When in operation it has been short circuited without stalling the engine, taking 285 amperes at two volts. On trial tests, with a load of 6500 pounds, the car has run up grades of 12 to 15 per cent. without stalling. The long continued use of such machines in the Fifth avenue service would seem to indicate they were thoroughly practical and dependable.

Gasoline-Electric Omnibus in Service on Fifth Avenue, New York City.

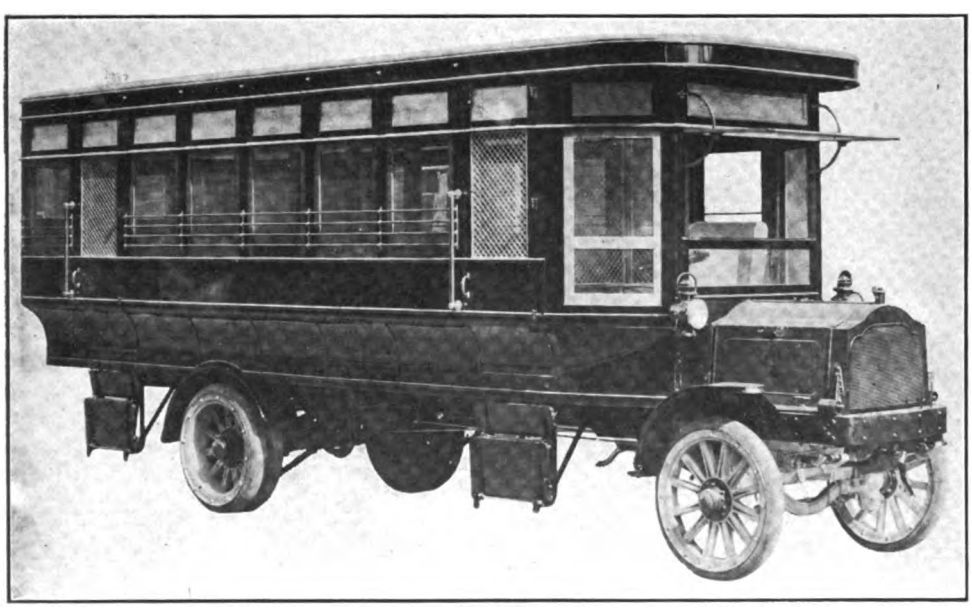
TESTING STUDEBAKER MAIL WAGONS.

During the past few weeks the government officials at Los Angeles, Cal., have been making tests of motor driven apparatus for the collection and distribution of mail. The tests have been exhaustive and accurate and it is expected that when the report is forwarded to Washington motor vehicles immediately will be purchased to supersede the horse drawn vans.

The Studebaker Corporation, Detroit, maker of Studebaker cars, furnished Postmaster Harrison of Los Angeles with two gasoline motor cars gratis and with an expert driver in charge. The cars were of the Studebaker 20 horsepower

Digitized by Google

light delivery type and were given regular runs of 12 hours daily, accurate record of fuel consumption, stops and repairs being taken. The machines accomplished an average of 100 miles a day without a mishap of any kind during the first three weeks and at much less cost than the same work could have been performed with a fleet of horse drawn wagons.



SIX GARFORDS REPLACE 60 HORSES.

The Watson Contracting Company, New York City, is one of the large concerns doing an extensive trucking business that uses Garford trucks, made by the Garford Company, Elyria, O., to transport heavy loads. This company has received numerous repeat orders from firms which have experimented with its vehicles and the New York concern is one of the latest to express its appreciation of their worth. For some time two two-ton trucks have been in service with such successful results that six five-ton vehicles were ordered recently. President Thomas B. Watson, wrote to the Garford Company:

"In accepting your proposition to furnish us with six more five-ton Garford dump trucks, for which you will find signed contract herewith, we desire to express our complete satisfaction with the two Garford trucks that we have had in use the last six months. Each one has replaced from five to six teams. Their operation has been constant and dependable so that we are now fully warranted in putting in a full motor truck equipment. The service and inspection has been thoroughly satisfactory and we can only speak in the highest terms of the treatment received from your company. We propose to sell 40 to 60 horses as soon as the motors are delivered, therefore please push this order along as quickly as possible."

INTERESTING MOTOR 'BUS BODY.

An accompanying illustration presents a new motor omnibus body, of the pay-as-you-enter type, recently produced by the Motor Truck Body Company, Detroit. It has seating accommodations for 29 persons, besides the driver, and the arrangement and size of the seats are the same as in the ordinary street car. The driver is separated from the remainder of the vehicle by a metal lattice partition, this extending along the back and side of the forward compartment to a sufficient height to preclude any interference from the passengers.

New Type of Omnibus Body Recently Produced by Motor Truck Body Company, Detroit.

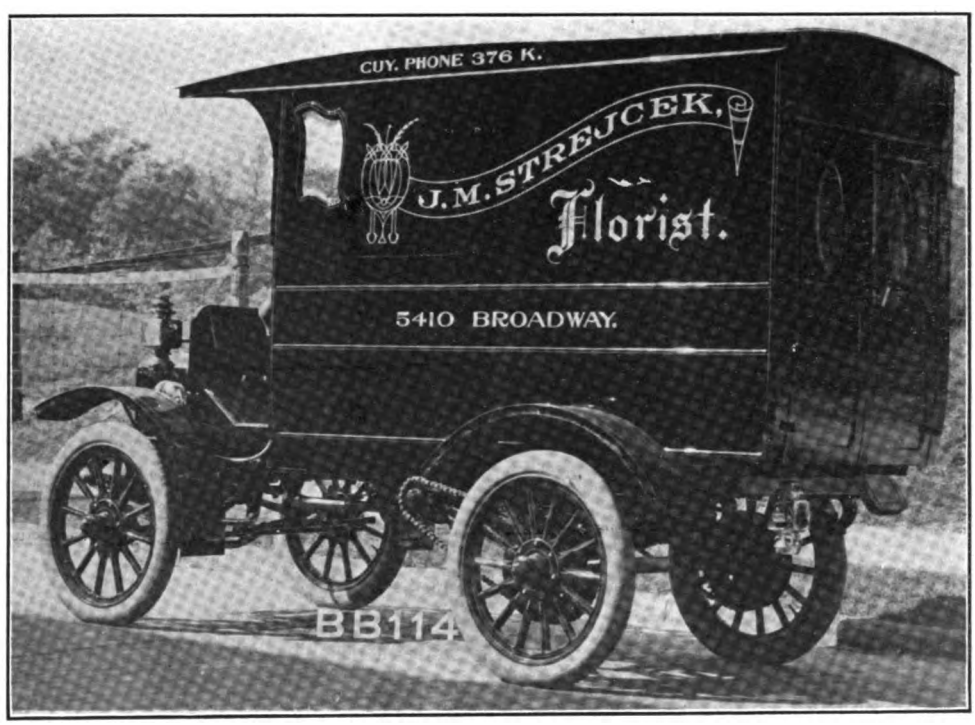
The illustration shows the doors closed and the steps folded against the side of the wagon. Both doors are provided with spring catches so that they may be operated separately from the driver's seat by substantial lever connections, and when the door is opened the folding steps release and offer a means for entrance and egress. There also is a lever under each door so that it may be opened from the outside if deemed necessary.

The body is strongly built of well seasoned oak and ash. The sides are panelled with metal and the windows are of the removable type. Two ventilators are provided, one at either end of the car. All windows, doors, ventilators, windshield and other removable parts are equipped with rubber bumpers to prevent rattling. The side windows are provided with curtains of water proof material, so that the passengers may be protected from weather conditions. The interior is equipped with electric lights of six candle-

Digitized by Google

power each, attached to the roof in such position as to afford the best possible illumination.

MORA 1500-POUND DELIVERY CAR.



The Mora Power Wagon Company, Cleveland, O., is producing a 1500-pound delivery wagon which is meeting with ready acceptance on the part of those interested in the transportation of light loads in merchandise delivery. The two-cylinder motor is of the four-cycle, double opposed, horizontal type, having a bore and stroke of 4.5 inches, and giving a rating of 16.2 horsepower under the S. A. E. formula. It is located under the hood, and is very accessible.

Lubrication is by a combined splash and force feed system. Cooling is by the thermo-syphon principle. The carburetor is a Stromberg. A true high-tension magneto is employed for ignition, and it is claimed that the motor may be started on a quarter-turn of the crank.

The clutch, jackshaft and planetary transmission are a unit and the latter is enclosed in an oil tight, weather and mud proof housing, which is provided with a large inspection plate. The clutch is of the multiple disc type, running in oil. Drive from the motor to the jackshaft is by shaft, provide with a large and well designed universal joint at either end. Final drive is by double roller chain.

Semi-elliptic springs are fitted both front and rear, and two sets of brakes are provided. When solid tires are employed, these are 36 by two inches in front and 36 by 2.5 in the rear, although 36 by 3.5-inch members are offered as extra for the front wheels. Pneumatics, as shown in the accompanying illustration, are 34 by four inches.

The company manufacturers a wide variety of standard bodies to meet the needs of individual purchasers and different industries. In addition, it is prepared to construct special types whenever occasion requires.

Mora 1500-Pound Delivery Wagon Fitted with Enclosed Panel Body for Florist Work.

REPEAT ORDERS FOR GRAMMS.

The merits of the Gramm motor trucks, made by the Gramm Motor Truck Company, Lima, O., is in no way more satisfactorily explained than by the numerous repeat orders that are received from time to time. At Chattanooga, Tenn., the Wallace Buggy Company, agent for Gramm trucks, delivered five vehicles during September. The Chattanooga Medicine Company and the Lookout Mountain & Chickamauga Sightseeing Company, the Sloan Coffee & Spice Company have all doubled their original purchases. One of the recent buyers of the Gramm is Mills & Lupton, a mill supply concern. After a trial of a few weeks they have ordered a second Gramm which will be put into immediate service when delivered from the factory.

FOUR LARGE UNIVERSAL CONTRACTS.

Contracts for 200 trucks have been closed by the Universal Motor Truck Company, Detroit, maker of Universal trucks, within one week with the following companies: George Esselman of Washington, D. C.; Paxton Motor Car Com-

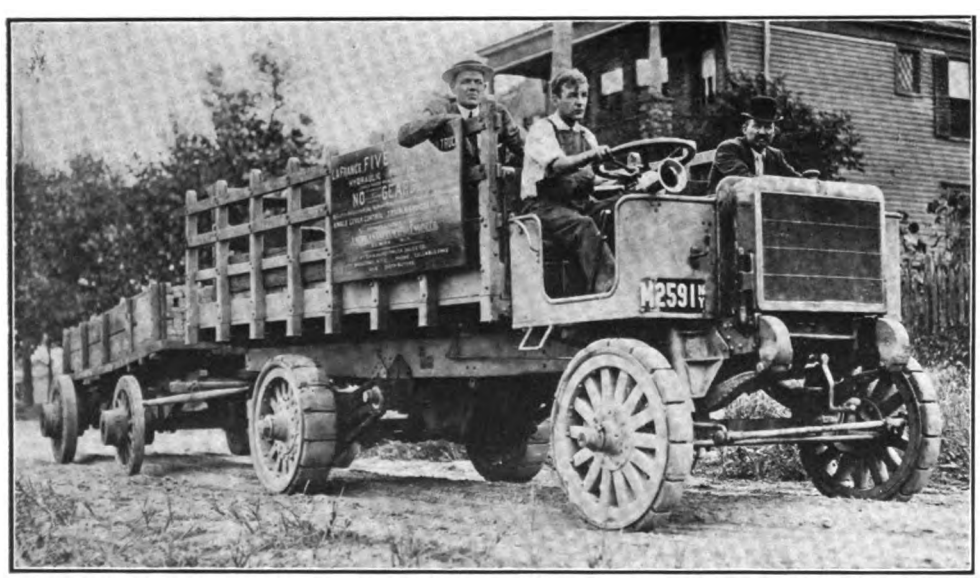
Digitized by Google

pany, San Diego, Cal.; Pittsburg-Chalmers Company and the Colonial Motor Car Company, Baltimore, Md.

PEERLESS IN EXPRESS SERVICE.

The introduction of motor trucks at Newark, N. J., by the United States Express Company, was followed by a peculiar result. Although unforeseen, it was important in affording ample opportunity for comparison. The company installed a Peerless three-ton truck, made by the Peerless Motor Car Company, Cleveland, O., which at once replaced 10 horses, the latter being sent to the company's stables at Jersey City, N. J.

The truck had scarcely begun to operate when the improved service over an expanded territory gave such an impetus to the business that it increased to such proportions that it became necessary to put the horses at work again, one team at a time. This will be continued until there are enough horses again in service to warrant replacing them with another motor truck. Some idea of the work done by the Peerless can be obtained from the statement that during 25 days it carried 470,051 pounds, ran 945 miles and made 1363 stops. This is a daily average of 13,802 pounds, 33.8 miles and 54 stops.



FEDERAL FOR MINING COUNTRY.

A Federal truck, made by the Federal Motor Truck Company, Detroit, purchased a few months ago by J. W. West of W. W. Barnett, Federal agent at Denver, Col., is performing a task daily that calls for the utmost efficiency. Mr. West operates it as a motor stage between Idaho Springs and Alice, Col., a distance of 11 miles, during which the vehicle reaches an altitude of 2700 feet.

At some points the gradometers register a pitch of 20 to 25 per cent. and one stop is made that is 10,000 feet above the sea level. The road is very rough and winds and twists its way up the hills, previously used as a trail. Two round trips a day are made, carrying mostly miners to the silver mines.

TESTING ADVANTAGE OF TRAILER.

The Hydraulic Truck Sales Company, 1777 Broadway, New York City, distributor for the LaFrance gasoline-hydraulic truck, has been making a number of tests recently for the purpose of determining the advantages to be gained by the use of trailers. The photograph reproduced herewith was taken during the trial in Jersey City, N. J., when the six-ton truck was loaded with six tons, and in addition hauled a trailer carrying nine tons, making a total of 15 tons. The truck weighed 4.5 tons empty and the trailer four tons. This entire load was hauled up a 10 per cent. grade, the truck being stopped on the grade twice, and started again, each time without difficulty.

LaFrance Gasoline-Hydraulic Truck Hauling Trailer with Combined Load of 15 Tons.

As a result of these tests the company has reached the conclusion that the use of a trailer materially decreases the cost of hauling goods. It is further claimed that the hydraulic transmission utilized in these trucks affords a tremendous tractive effort and that this factor makes the LaFrance the logical truck for trailer work. It will be noted in the test described the truck was not overloaded, and the Hydraulic concern is firmly of the opinion that the only proper method of increasing the load is by using a trailer as has been outlined in the foregoing.

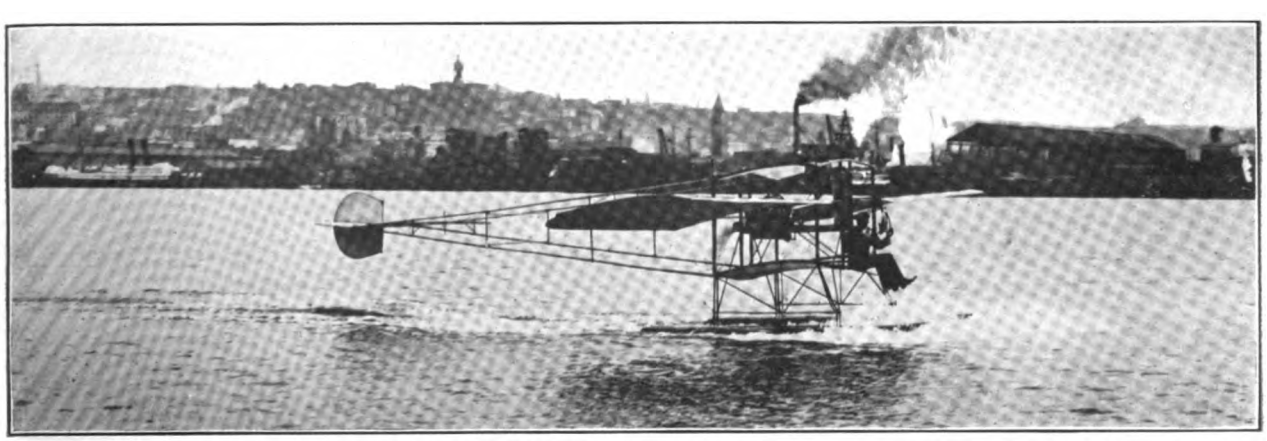
In The Aviation Field

With the Manufacturer and Operator in America and Abroad



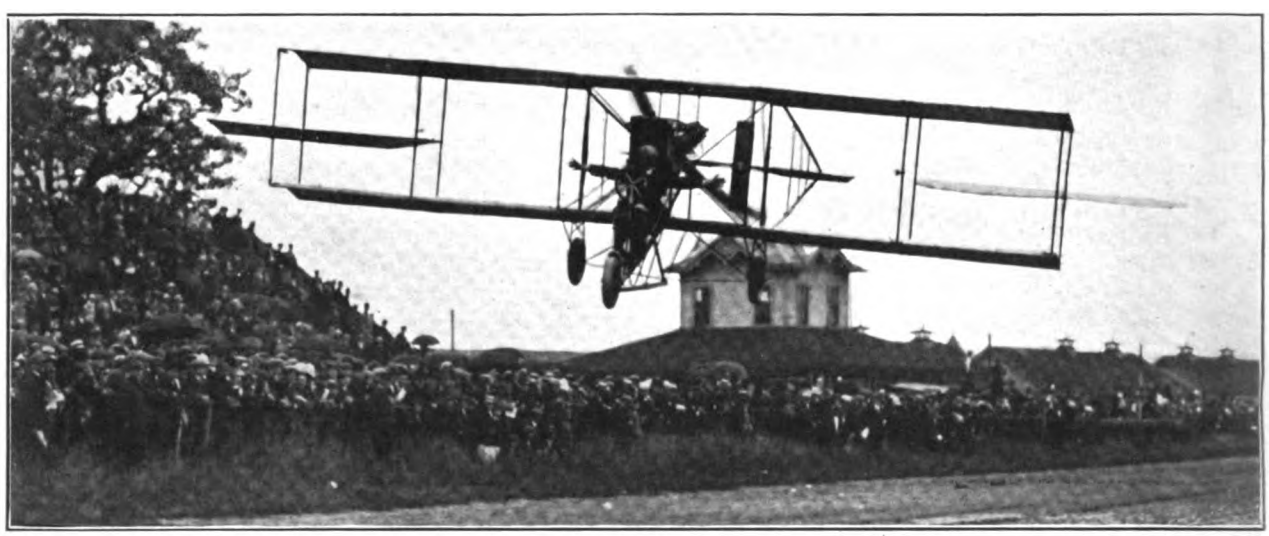
Glenn H. Curtiss announces that he has perfected a gyroscopic device which solves the problem of automatic stability. It is understood that he claims both fore and aft and lateral stability with his invention, a separate gyroscope being needed for each. The details are lacking, as was true in connection with the announcement made by the Wrights, after some little experimentation last year.

Curtiss claims to have given the new device severe tests in connection with his latest type of hydraeroplane, or "flying boat" as it has been termed. Aeroplane constructors agree that the hydraeroplane offers much more inherent safety than either the biplane or monoplane. Apparently, Curtiss does not intend to make known the details of his arrangement until he has had abundant opportunity to test it under every condition.

In discussing the announcement, Orville Wright states he has little faith in the gyroscope principle, but if Curtiss can make it work he certainly is entitled to all the credit. Regarding his own device, Wright says he expects to have it ready for the market about the first of the year.

Both men agree that flying is to be made much more safe in 1913. This seems to be borne out by the fact that new stabilizing devices are being reported from several quarters. A number have been announced in France and elsewhere on the Continent. This particular subject seems to be engaging the attention of a large number of inventors, as is evidenced by the records of the patent office at Washington within the past few weeks.

An accompanying illustration presents a new hydraeroplane of American manufacture which was given its initial tests at Seattle, Wash., last month. It is termed a "mono-hydraeroplane" by its inventor, Roger Varich, and while details of construction are lacking, it would appear from a close study of the photograph that the designation was somewhat misleading. There appear to be three plane surfaces, the monoplane structure being set in the gap between a smaller biplane. The machine is said to have performed very



Roger Varich in His "Mono-Hydraeroplane," Fitted with Hall-Scott Motor, Making Its Initial Tests at Seattle, Wash.

Digitized by Google

creditably in the hands of its constructor and to give every promise of being a complete success in every way. It is fitted with a Hall-Scott motor, made by the Hall-Scott Motor Car Company, West Berkeley, Cal.

The first competition for the Clarence H. Mackey trophy for army aviators was held from College park, Washington, Oct. 9, but three aviators being entered. These were: Lieut. H. H. Arnold, Wright; Lieut. T. D. Milling, Burgess-Wright, and Lieut. R. C. Kirtland, Burgess tractor military biplane. The last named machine developed engine trouble and failed to get away. Milling was taken ill in the air and was compelled to return at the end of 15 minutes. Arnold therefore had little competition in winning the award.

Lincoln Beachey Giving an Exhibition of Flying with Both Hands Removed from the Control of His Curtiss Biplane.

Troop F of the 15th United States cavalry was sent out from Fort Myer, and this was the "enemy" the contestants were required to search out. The scouts were to fly at an altitude of more than 2000 feet as a matter of precaution against terrestrial fire. If they dropped below 1500 feet they were to be penalized, and if below 1000 feet disqualified. The object was to "discover the enemy" and report to the commanding officer, the scout performing this duty in the shortest possible time winning the cup.

Lieut. Arnold left College park at 9:30, flew across Washington and straight over Fort Myer. He continued to the edge of Ballston, Va., thence south to Nauck station, where he picked up a column of cavalry accompanied by three escort wagons. Accumulating this information he flew back to College park, having been gone exactly 41 minutes.

An accompanying illustration shows Lincoln Beachey in one of his spectacular flights with a Curtiss biplane. It will be noted that the aviator has both hands free of all controls, and while this illustrates the remarkable stability of the Curtiss machine, it is not a pose to be recommended to those who desire to create the impression that flying is a safe means of transportation.

Pierre Daucourt of France appears to have made a record in the competition for the Pommery cup in that country which will be hard to exceed. The cup goes to the aviator who makes the longest cross country flight between sunrise and sunset any day during 1912. Oct. 13, Daucourt left Valenciennes, on the Belgian border at 5:59 in the morning, and arrived in Biarritz, almost on the Spanish border, at 5:38 in the afternoon. He thus practically flew across France, covering a distance of 570 miles, with three stops for fuel replenishment. The machine used is supposed to have been a Borel monoplane.

Charles Wald, flying a Wright biplane, fitted with hydraeroplane attachment, made what is believed to be the first rescue from drowning at Glen Head, Long Island, Oct. 9. Walter Strohbach fell out of a rowboat in which he was seeking diversion, and although there were a number of other boats on the water at the time, Wald's attention was called to the drowning man. He

Digitized by Google

covered the half-mile between the two ahead of all other competitors, threw a life preserver to Strohbach and pulled him on board the hydraeroplane. Smiling at the boatmen who had arrived too late, Wald flew back to land with the rescued man.

Lieut. John H. Towers, U. S. N., created a new world's record for continuous flight with an hydraeroplane in a Curtiss machine at Annapolis, Md., Oct. 13, remaining aloft for 6:10:35. The previous record was held by Harry N. Atwood in a Burgess-Curtis machine in a flight along the New England coast, Dec. 11, 1911, occupying 2:40:00. The flight also is a new American duration record for aeroplanes, the previous mark being held at 4:23:38 by the late Paul Peck in a Columbia biplane.

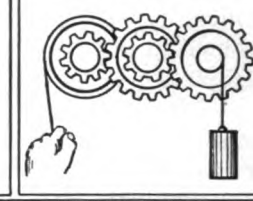
The altitude maintained was from 200 to 1200 feet. At one time, when it became necessary to cut in the reserve fuel supply, Lieut. Towers was forced to leave the control, and the machine glided, dropping several hundred feet. On another occasion a small bird became caught in the propeller and was killed.

Flying a biplane of his own construction, Harvey Crawford of Puyallup, Wash., covered the distance between his home town and Tacoma, Sept. 29. The flight was a remarkable success from every viewpoint. Crawford reached an altitude of 7000 feet at one point. The machine is of the Wright type.

The Royal Academy of Belgium has published its report concerning the experiments carried on by it during the past two years with toy ballons, in an effort to determine the condition of the atmosphere at various distances above the earth's surface. The experiments were carried on with a view to determining the effect of the air currents upon the weather, but it is anticipated that the data obtained will prove of value in the study of aviation as well. Fifteen of the balloons sent up reached an altitude of more than 25,000 metres, which is about 15 miles. One went as high as 32,430 metres, or about 19 miles.

The Bosch Magneto Company, New York City, calls attention to the fact that many of the recent international events in aviation were won by machines equipped with the Bosch magneto. Among these may be mentioned the world's altitude record of Legagneux in a Morane monoplane, distance and time records of Henri Farman in a Bleriot-Farman biplane, the altitude record of Roland Garros in a Bleriot monoplane and the winning of the Gordon-Bennett trophy by Jules Vedrines in a Deperdussin monoplane.

In the recent international hydraeroplane meet at Tamise, Belgium, the prize winning machines were all Bosch equipped, as follows, the listing being according to the number of points obtained by each: Chemet, Borel monoplane, 80 horsepower Gnome; Benoist, Sanchez-Besa monoplane, 100 Renault; Renaux, Maurice Farman biplane, 70 Renault; Beaumont, Donnet-Leveque biplane, 80 Gnome; Molla, R-E-P monoplane, 80 Gnome; Weymann, Nieuport monoplant, 100 Gnome; Barra, Paulhan biplane, 85 horsepower, eight-cylinder V; Lanser, Lanser biplane, 70 Gnome; Train, Astra-Train monoplane, 80 Gnome; Gobe, Nieuport monoplane, 100 Gnome; Buson, de Brouckere monoplane, 100 Gnome.



Just before sailing on a trip abroad with his wife, W. Starling Burgess of the Burgess Co. & Curtis, Marblehead, Mass., announced that his company had secured a contract from the United States government to construct four weight carrying aeroplanes, three of them to be of the Burgess-Curtis hydraeroplane type.

Flying a Wright biplane to which he had fitted an hydraeroplane attachment of his own design, Marshall Reid left Cape May, N. J., Oct. 11, accompanied by Lieut.-Com. H. C. Mustin, U. S. N., for a flight to the Philadelphia navy yard. Shortly afterward, when just out of sight of land, according to Reid's published statement of the accident, the motor exploded and the machine dropped to the surface of the water, where its two occupants were obliged to drift for 16 hours before being picked up. Reid declares that the value of the pontoons was ably demonstrated and he is convinced that water flying is much more safe than venturing over the earth's surface.

Some time ago the Seine general council of Paris offered a prize of 5000 francs to the aviator who should fly around the city the greatest number of times before Dec. 1. The stipulated course is from Juvisy to Vincennes, Le Bourget, Sartrouville-Montesson, Buc and back to Juvisy. On each round the competitor is required to alight at Juvisy to sign the control sheet. The first attempt to take the award was made by Daucourt, flying a Borel monoplane, early in the month. He succeeded in rounding the course seven times between 6 o'clock in the morning and 6:22 o'clock in the afternoon.

RECENT MOTOR VEHICLE PATENTS

Hubert Portable Electric Light.

Conrad Hubert, New York City, has been granted a patent for a portable electric light comprising a casing into which is placed the battery, and means for making proper connection to the positive and negative poles. The casing is provided with an aperture for securing the electric bulb, contact with the lamp being made by a finger member. The other casing terminal is exposed. The circuit is closed through this terminal, a movable finger device being fitted to the exterior of the casing. Means are also provided for locking the switch mechanism.

Bassett Radiator Shield.

The patent granted Frank F. Bassett for a radiator shield is a reminder of the approach of cold weather when the radiator will require protection from the freezing winds. The Bassett device does not differ from those of the usual form, but means are provided for securing the shield through the openings of the cooler and without injury to the metal. Bolts and flexible washers are utilized to retain the shield and the bolts are covered with a sleeve of soft material to prevent chafing due to vibration. The device is constructed so that it may be detached and replaced easily, catches being provided for this purpose.

Moran Fuel Reservoir.

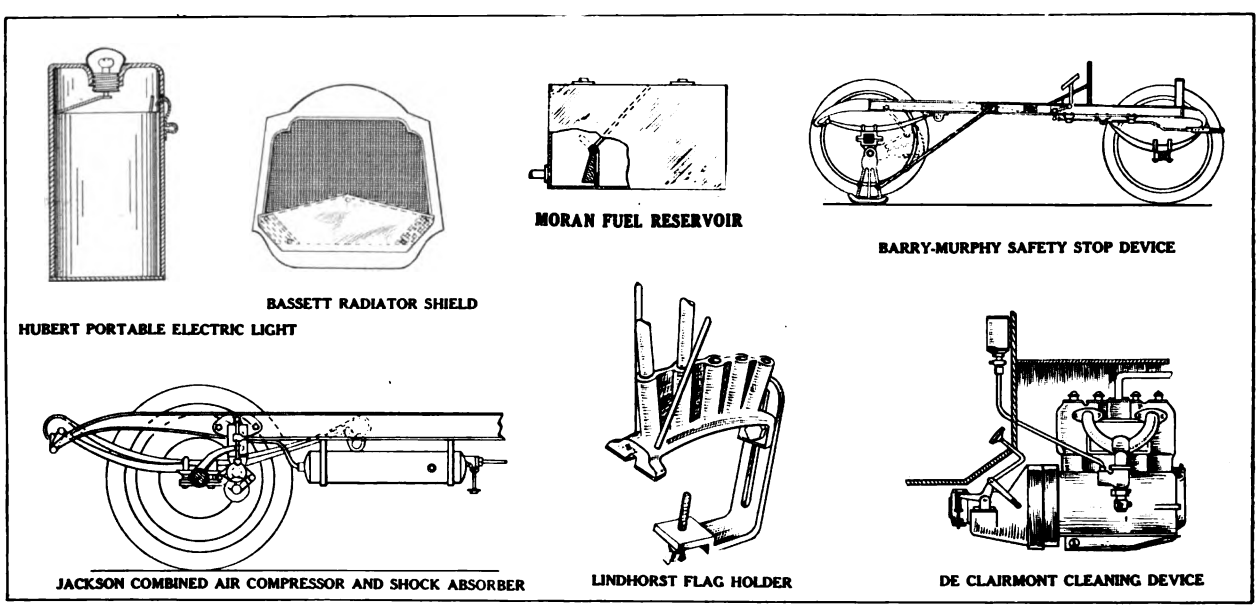
One of the troubles experienced with fuel tanks supplying gasoline to the carburetor by gravity is that when the car is ascending a steep grade and the vaporizer is higher than the level of the fluid in the vessel, the motor is starved of mixture. William H. Moran, New York City, has patented a fuel reservoir which device is claimed to overcome the trouble. The design is such that it is stated in his claims that when the tank is tilted the fuel will be discharged through the proper channels to the carburetor. The vessel is constructed in two parts, a main and an auxiliary chamber. A pivotally weighted valve is incorporated, its function being to allow the flow of fluid from the main into the auxiliary chamber, but to obstruct its return. This operation is performed automatically when the tank is tilted or when the discharge head of liquid in the large chamber is greater than that of the other compartment.

Barry-Murphy Safety Stop Device.

Richard P. Barry and John W. Murphy, Brooklyn, N. Y., have patented a safety stop device for motor cars which presents novel features in that the vehicle is checked by means of a pair of shoes. These members are pivotally connected to the rear axle of the machine so that they may be dropped to the ground when desired. They are connected to operating mechanism and actuated by a pair of arms having a ratchet wheel rigid with said arms. A pawl co-operating with the ratchet member maintains the arms and shoes in a raised position when the service of the latter is not desired. Upon releasing the pawl mechanism, the shoes drop to the ground, restraining the movement of the vehicle.

Jackson Air Compressor and Shock Absorber.

Joseph D. Jackson, Jr., Washington, D. C., has been granted a patent for a combined air compressor and shock absorber applicable to motor vehicles. It is designed to store a quantity of fresh air for the purpose of inflating pneumatic tires, operating a motor starter or other device employing compressed air. The atmosphere thus stored is also utilized as a shock absorber. The air is pumped by the action of the vehicle springs. A cylinder is attached to the body of the machine and the piston of the compressor is so designed that it completes its stroke before it reverses, compressing the air which is conducted by suitable means to a storage tank. Check valves are provided, also a flexible tubing to compensate for the movement of the cylinder. Motion is imparted to the piston by the movement of the frame when the car is traversing rough roads. The construction and operation of the shock absorbing device is as follows: A crank disc is mounted on a shaft, a component of the bracket securing the device to the frame, and the shaft is journaled in bearings in the depending portion of the bracket. In the opposite end of the shaft is a pinion which meshes with a gear wheel on the shaft. This gear wheel carries a ratchet member.



Digitized by Google

Two arms are mounted upon the shaft and carry pawls which engage with the teeth of the ratchet member, are actuated by springs and are always held in engagement with the ratchet. The pawls are reversed so that when one is turning the ratchet and gear wheel in one direction, the other is slipping over the teeth of the ratchet. Lever arms are connected to the other arms, the former members being pivotally secured. One of the lever arms is connected to a bolt in the bracket arm which is secured to the axle by clamping bolts. Through the bifurcated end of the bracket extend screws which are concaved at their inner ends to partly embrace the bolt. This construction, the inventor claims, permits the lever arms to swing on the bolt member as well as on the screws, giving a universal movement.

is a reservoir containing the cleansing fluid. A pipe connects the vessel with the float chamber of the carburetor and a valve is incorporated in the reservoir to control the flow of the liquid. The nature of the cleansing material to be employed is not given by the inventor, but it is presumed that any liquid decarbonizing preparation may be utilized.

Lindhorst Pennant Holder.

The growing tendency to mount flags and pennants upon the automobile has been productive of a number of ingenious devices for securing these members. Edward H. B. Lindhorst, Butte, Mont., has patented a flag holder that differs from those of ordinary construction in that five flags may be carried in one device if desired. The support comprises an arched base having a

Presenting Some of the Recent Efforts of Inventors, Including a Radiator Shield, Portable Electric Light, Safety Stop Device, Multiple Pennant Holder and Combined Air Compressor and Shock Absorber.

When the axle and chassis frame move up or down the piston completes its stroke before it reverses, or in other words, the crank disc will always rotate in the same direction. This is due to the movement of the arms which rotate the gear wheel in the same direction, whether said arms move up or down, as the pawl on one will be moved over the teeth of the ratchet while the teeth of the other pawl rotate the gear wheel. By this construction the piston is always cushioned.

De Clairmont Motor Cleaning Device.

Adolfo De Clairmont, Toledo, O., has been granted a patent for a device for cleansing the cylinders of an explosive type motor while it is operating under its own power. Mounted on the dash of the automobile or other convenient place,

depending foot at either end, said base being formed integral with the socket members. The clamp consists of a vertical arm and bottom plate, and one of the feet of the base carries a bolt having a clamping nut, the bolt extending through the slot of the vertical arm of the clamp, providing means for adjusting the device to different conditions of service. The bottom part of the clamp has a depression adjacent to the vertical arm, having its outer free end offset and carrying a clamp screw.

President A. V. Myer of the National Motor Supply Company, Cleveland, O., will sail Nov. 1 to look after the European business of his concern which makes the National vulcanizer.

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

Decision Aids Independent Show.

At the recent meeting of the Motor & Accessory Manufacturers, the question as to exhibiting products at the first independent national motorcycle show in Chicago, Feb. 1-8, came up on a request from the Bosch Magneto Company, New York City, for information concerning this point. After some little discussion it was decided that members of the association, who in addition to supplying automobile manufacturers also supply motorcycle producers, should be permitted to display such wares or products as are especially applicable to the motorcycle without affecting their status in the association. This decision is of immense importance in connection with the accessory end of the industry, and it is probable that it will aid greatly in making the Chicago show the success that has been anticipated.

Long Tour on Emblem.

Side by side on a specially constructed Emblem mount, made by the Emblem Manufacturing Company, Angola, N. Y., Mr. and Mrs. M. E. Gale of Angola have won their way to the Pacific Coast and are now returning across the continent in the same manner. Their ride is considered one of the most strenuous tests of reliability and endurance yet given a motorcycle. In many places the roads were in bad condition; there were stretches where there was nothing but a path to follow, and the desert trails offered hardships and obstacles that seemed nearly insurmountable.

Two Young Women of Saddle River, N. J., Whom the Emblem Agent Is Interesting in Emblem Machines.

Despite these handicaps the Emblem went steadily ahead and reached San Francisco without mishap. The transcontinental trip began July 15. The motorcycle is so constructed that the riders sit side by side and it may be operated by the rider from either seat. On their way to Columbus, O., Mr. and Mrs. Gale joined one of the tours to the national convention of the Federation of American Motorcyclists. After several days at Columbus, during which they were objects of much interest, they continued their journey as originally planned.

Hendee Company Expands.

The Hendee Manufacturing Company, Springfield, Mass., maker of Indian motorcycles, has completed extensive additions to its factory and now claims to be the largest concern in the world devoted exclusively to the manufacture of motorcycles. As the company closed its year, Oct. 1, with 1200 employees on its payroll and an output of 19,750 motorcycles for 1912, the size of the industry is apparent. With the new factory additions it is expected that employment will be given to 2000 men with an output for 1913 of 35,000 machines. The new buildings include a two-story storehouse and a five-story factory building.

Touring Bureau Starts Work.

The F. A. M. touring bureau, authorized at the Detroit meeting, has come into existence and is now busy making preliminary preparations for collecting information of interest to all members of the federation who contemplate touring in various parts of the country. An effort will be made to provide only reliable information and to give its beneficiaries complete details—not a mere outline of routes as many might expect.

riders carried off the honors. B. A. Swenson, riding an Indian, made by the Hendee Manufacturing Company, Springfield, Mass., was the winner

Mr. and Mrs. Harry Humphries, Los Angeles, Cal., and Their World Touring Minneapolis.

in two events, while John C. Garand took one event, also riding an Indian. Mr. Swenson acted as pacemaker for one of the horses running against time for half a mile.

Around the World on Minneapolis.

An accompanying illustration presents Mr. and Mrs. Harry Humphries of Los Angeles, Cal., who are on their way around the world on a Minneapolis mount, made by the Minneapolis Motorcycle Company, Minneapolis, Minn. The picture was taken just before leaving home. The trip is the result of a wager, and while no specific time limit has been set, it is understood that the journey will be made in 1000 days. They must cover a certain specified route, however.

Starting from Los Angeles the early part of August, Mr. and Mrs. Humphries first went to San Francisco, thence to Portland, Ore., and Vancouver, B. C. When last heard from they had turned eastward and planned to reach the Atlantic seaboard across the Dominion at St. John, N. B. They will then turn southward to New York City, and cross and recross the country, until they have visited every state, before sailing for Europe.

Henderson Meets with Success.

The Henderson Motorcycle Company, maker of Henderson four-cylinder machines, has reported that one-half of the 1913 output from its Detroit factory has been disposed of by contracts with various dealers. J. W. Grady of Worcester, Mass., has secured the agency for Maine, New Hampshire, Vermont and Massachusetts. A recent shipment was made to Brazil and Argentina, and England has ordered 10 machines.

Is Motorcycle Enthusiast.

Mrs. Maria Steel, 78 years old, of Duluth, Minn., has become an enthusiastic motorcyclist since going to Warren, Penn. Recently she took a ride of 12 miles and stated she was going to take many more and longer ones. For many years Mrs. Steel has enjoyed bicycle rides and is an open air enthusiast. She says she does not consider it unusual that she should like motorcycling, stating that any woman of her age who has enjoyed out-of-door sports all her life, would do the same.

Relay Race Postponed.

Owing to bad road conditions in various parts of the country, the motorcycle ocean-to-ocean relay race, which was to have been held this month, has been postponed for the present. In making detailed arrangements it was learned that conditions were such as would interfere seriously with a fair test of the motorcycle's power and endurance. It was thought best to suffer the annoyance of delay rather than to hold the run under an extremely unfavorable handicap.

New Motor Attachment.

Vice Consul General Richard Westcott of London, England, reports that a new motor attachment for changing an ordinary bicycle into a motorcycle has been perfected and will soon be on sale. The invention is called the "auto-

J. C. Hylstead, Vice President Rhode Island Motorcycle Club, Providence, and His Pope Mount.

wheel" and consists of a third wheel with motor, to be at attached to the rear wheel of a bicycle. Several reprints from Motor Cycling describing

Digitized by Google

the invention accompanied the report and will be loaned to those interested, upon request.

Western Canadian Championship.

The Canadian Motorcycle Association ran off the western Canadian championship races at Winnipeg recently, after several postponements, the title going to Baribeau with an Indian machine. The results follows:

Five miles, private owners—First, Turnock, Indian; second, Hughson, Merkel.

Five miles—First, Baribeau, Indian; second, Cruickshank, Indian; third, Mavor, Indian.

Ten miles—First, Baribeau, Indian; second, Cruickshank, Indian; third, Patterson, Excelsior.

Five miles—First, Baribeau, Indian; second, Cruickshank, Indian; third, Mavor, Indian.

One mile, for Roby cup—First, Baribeau; time, 0:58.

Five miles—First, Baribeau, Indian; second, Cruickshank, Indian; third, Pelham, Indian.

Ten miles—First, Mavor, Indian; second, Cruickshank, Indian.

Ten miles—First, Pelham, Indian; second, Cruickshank, Indian.

Fifteen miles, open, for Baribeau cup—First, Pelham, Indian; second, Cruickshank, Indian; third, Mavor, Indian.

Results at Rockingham Park.

At the motorcycle races held at Rockingham park, Salem, N. H., Oct. 19, Channing R. Burbank, on an Indian covered five miles in 4:32.4, a new track record. The performance was all the more notable, in that it was accomplished in a light rain. The results follow:

Fifteen miles, professional—First, Carroll, Indian; second, Gustavson, Indian; third, Crandall, Thor; time, 15:04.4.

Twenty-five miles, professional—First, Crandall, Thor; second, Carroll, Indian; third, Helliwell, Indian; time, 27:17.4.

Meet in Pawtucket, R. I.

In conjunction with a proposed biplane flight by Aviator John McGee, 3000 people witnessed good motorcycle racing at Pawtucket, R. I., Oct. 19, despite the light rain. The results follow:

Five miles, amateur—First, Garand, Indian; second, Peterson, Indian; third, Bell, Indian; time, 9:36.

Five miles, professional—First, Swenson, Indian; second, Frazier, Indian; third, Carlton, Indian; time, 9:38.5.

Five miles, amateur—First, Garand, Indian; second, Bell, Indian; third, Peterson, Indian; time, 9:07.6.

Five miles, professional—First, Swenson, Indian; second, Carlson, Indian; third, Frazier, Indian; time, 8:10.

Chicago Endurance Run.

The Chicago Motorcycle Club held its semi-annual endurance run recently over a 193-mile course including Michigan City, South Bend, Joliet and Chicago. Out of a field of 30 entries there were six perfect scores, as follows: Oscar Persons, Harley-Davidson; R. T. Purdy, Harley-Davidson; L. C. Davis, Excelsior; J. B. Mason, Indian; Thomas Monroe, Special; Gale Smart, Thor.

Crocker in Charge at Denver.

A. H. Crocker, cashier of the Pacific Coast branch of the Hendee Manufacturing Company, Springfield, Mass., maker of Indian motorcycles, has been promoted to the management of the branch at Denver, Col., made vacant by the transfer of W. E. Johnson, who has taken charge of the new branch at Atlanta, Ga., his former home.

Trip Across Continent.

Hugh Fargo, writer and photographer, and Charles Crawford, motorcycle salesman, left Atlantic City, N. J., recently on a Henderson machine, made by the Henderson Motorcycle Company, Detroit, for Los Angeles, Cal., riding tandem. They are carrying a message from the mayor of Atlantic City to the mayor of Los Angeles.

Harley-Davidson Branch Manager.

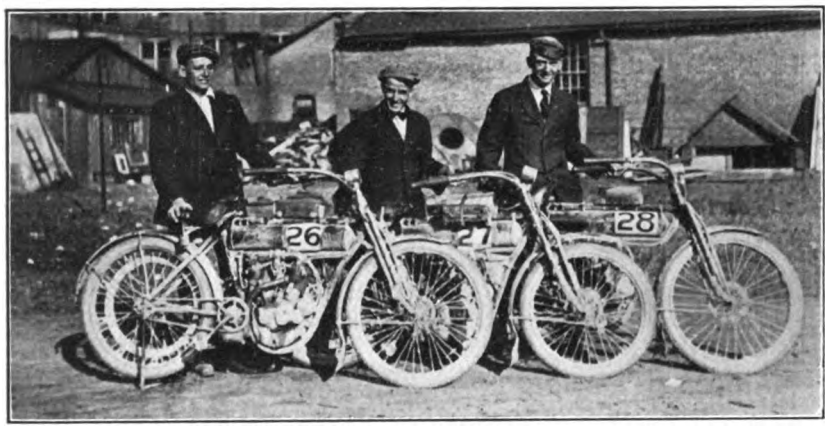
W. J. Walker of Danvers, Mass., one of the best known men in the motorcycle trade in the East, has been appointed branch manager for Harley-Davidson mounts, made by the Harley-Davidson Motor Company, Milwaukee, Wis., in

ATTENTION MOTORCYCLISTS

Immediate deliveries of 1912 Indians, any Model. Cash or installment. Full line of equipments and supplies, also clothing for the Motorcyclist.

B. A. SWENSON

298 Blackstone Street, Providence, R. I.



1913 F. N. SHAFT-DRIVE MOTORCYCLES.

Lightweight Single, with Two-Speed Gear $275

Merkel Team in Recent Ohio Run: Left to Right, L. S. Taylor, William Bewley, J. F. Sanford.

the New England territory. Mr. Walker has for several years been connected with the motorcycle industry and has made for himself an enviable reputation in the mechanical end as well as in the sales department.

He is thoroughly familiar with the mechanical features of the Harley-Davidson machines, thereby enhancing his ability to care for every detail of the business. The New England headquarters and service station are located at Danvers, and Mr. Walker proposes to make his work as thoroughly efficient as possible.

Results in Ohio Run.

One of the most important motorcycle reliability runs of the season was that held by the Ohio State F. A. M. from Toledo to Cincinnati, Oct. 11-13, covering a distance of 573 miles. There were 28 entries and 28 starters, of which only nine survived the third day. A bronze shield was promised to each team finishing with a perfect score, but none was awarded because not a single team finished intact. Three teams started as follows: Yale, George H. Squier, I. F. Jacobs and James Campbell; Harley-Davidson, George Puls, Walter Lawrence and W. J. Lister; Merkel, W. Bewley, J. F. Sanford and L. S. Taylor. The Class B, or factory riders, included the following: C. C. McDonald, Yale; E. G. Baker, Indian; E. F. Kumler, R-S; E. J. Hawkins, Thor; H. D. Capron, Yale; Paul Monroe, Yale; C. Friedman, Triumph. Class A, or individual riders, included: C. A. Leander, Yale; A. J. Angel, Yale; W. J. O'Shea, Yale; J. T. Greene, Yale; L. Bersticker, Yale; W. R. Dreher, Yale; O. W. Rockfield, Indian; E. W. Huberty, Indian; L. C. Nieschwutz, Indian; H. Sell, Excelsior; H. Schenk, Excelsior; C. McGough, Harley-Davidson. Of these four finished with perfect scores, Squier, Jacobs, Hawkins and Baker. The others had the following scores: Campbell, 996; Monroe, 996; Leander, 992; Sanford, 942, and Lister, 92[illegible]. The Merkel team is shown herewith.

Demonstrating Indian's Power.

T. A. Roth of Plaquemine, La., represents the Indian mount, made by the Hendee Manufacturing Company, Springfield, Mass., in his territory. Herewith is reproduced a photograph taken by him recently, which sets forth his method of demonstrating the value of the Indian clutch mechanism, as well as its tractive ability. It will be noted that a four-wheeled buggy and two passengers are assisting him in the demonstration.

Will Operate Pierce Factory.

The company which recently purchased the plant of the Pierce Cycle Company, Buffalo, N. Y., intends to operate the business under a reorganized system. Work is being done on the 191[illegible] models, of which it is planned to build 5000.

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, etc.:

Smith Garage, Hempstead, N. Y.; $2000; incorporators, Lawrence Schultz, Joseph Pensock and others.

Standard Garage Company, Paterson, N. J.; $25,000; incorporators, Martin White, Susan B. White, Oscar Harris.

Hunt & West, Inc., New York City; $10,000; to deal in motor cars; incorporators, Burton R. Law, John W. Collopy, Jr., Elly Z. Parker.

Otis Motor Sales Company, Utica, N. Y.; $10,000; incorporators, T. Harvey Ferris, William T. Cantwell, Edward J. Otis.

Standard Auto Company, Paterson, N. J.; $2500; general automobile business; incorporators, Christian Braun, William F. Drexler, Henry Stoeher.

Mercedes-Daimler Selling Corporation, New York City; $50,000; to deal in motor cars; incorporators, A. M. Becker, John A. Lemline, E. H. Ferguson.

Hub Twenty-Second Street Garage Company, Camden, N. J.; $100,000; to conduct a garage; incorporators, F. R. Hansell, George H. B. Martin, I. C. Clow.

Co-Operative Auto Sales & Supply Company, Olympia, Wash.; $100,000; incorporators, H. F. Preston, G. F. Preston, W. A. Mentrum, F. A. Mentrum, M. S. Alder.

Miller, Hicks & Hewitt, Inc., New York City; $10,000; automobile bodies, painting, trimming, etc.; incorporators, Harry D. Miller, Henry T. Hicks, George A. Hewitt.

South Park Automobile Garage Company, Chicago; $25,000; general garage and livery business; incorporators, Herman Frank, Harry J. Lurrie, John A. Anderson.

Cameron-Rowe Auto Service, Inc., New York City; $10,000; to operate a motor car service station; incorporators, James Cameron, Norman Cameron, August T. Rowe.

Reliance Speedometer Company, Portland, Me.; $100,000; incorporators, Charles M. Drummond, G. M. Horne, Wadleigh B. Drummond.

New York Garage Association, New York City; $2000; to conduct general garage keepers' exchange; incorporators, Charles H. Potter, Louis J. Joscelyn, William Burrows.

Lamay Manufacturing Company, Rochester, N. Y.; $25,000; to manufacture fire extinguishers for automobiles and motor boats; incorporators, Arthur B. Headley, Philip E. Tucker, Arthur C. Lamay.

Grafton Motor Company, Grafton, W. Va.; $5000; to repair and store automobiles, deal in and hire same; incorporators, Henry J. Pracht, H. D. Comerford, J. Howard Reynolds, A. R. Kunst, D. C. Peck.

Western Auto Sales & Manufacturing Company, Omaha, Neb.; $50,000; to sell automobiles and to manufacture tops, covers, etc.; president, A. W. Gilman; vice president, A. W. Cole; secretary, M. M. Searles.

Jefferson Automobile Company, Peoria, Ill.; $30,000; to manufacture, repair and deal in automobiles and to operate a garage; incorporators, R. C. Uckena, Frank E. Howland, F. I. Archdale, W. C. Ronneberg, Cedric Howland.

Bucksport Motor Company, Bucksport, Me.; $6000; incorporators, J. E. Witham, H. N. Churchill, H. E. Churchill.

T. F. Hahn Company, New York; $10,000; incorporators, Elizabeth Hahn, Jeanette A. Bravy, Charles Le Fevre.

W. D. C. Motor Car Company, Elizabeth and Newark, N. J.; $50,000; incorporators, Peter C. Walls, Walter E. Camping, William J. Drumplemann.

Taxicab Company, Charleston, W. Va.; $5000; to deal in and repair automobiles and other vehicles; incorporators, F. J. Hill, F. A. McGrew, R. C. Lanham, J. H. Love, G. A. Denz.

Buffalo Resilio Company, Buffalo, N. Y.; $25,000; to manufacture tires for motor vehicles; incorporators, Stafford D. Noble, Alexander D. Falack, Philip E. Lonergan.

Excelsior Automobile Company, Elizabeth, N. J.; $50,000; general automobile business; incorporators, Patrick H. McGann, Cade Raiemes, Peter Kern.

Holland, Donnelly Company, Atlantic City, N. J.; $100,000; general automobile business; incorporators, Edwin J. Holland, Edwin R. Donnelly, Harry L. Gilberson.

Continental Motor Corporation, Buffalo, N. Y.; $100,000; to manufacture motor parts and accessories; incorporators, Gordon F. Matthews, Frank V. Wayland, Allen E. Choate, Walter Schmieding and R. L. Hurd.

GARAGE AND DEALER.

J. L. Tippins has opened a tire repair shop on Broughton street, Savannah, Ga.

The Lemaster Garage, Ottawa, Kan., has been sold to William D. Sprague by Glen J. Lemaster, the former owner.

John H. Gerhardt, Laurel, Kan., has purchased for $30,000, the Frizzel garage, formerly conducted by E. E. Frizzel.

Federal Auto Accessories Company, Columbus, O., is the name of a new concern which has started business in that city.

Ira N. Thompson, Columbus, O., has opened a new garage on North Fifth street, with a capacity for storing 36 machines.

W. C. Stopher has opened a garage on North Market street, Wichita, Kan., and will handle the Regal and Abbott-Detroit lines.

The Rude Auto Company, Perry, Ia., is planning enlargements to its establishment and will conduct a garage and repair shop.

The Boone Auto Company, Boone, Ia., is to erect a modern, one-story garage to cost $15,000, plans having recently been perfected.

Fred Redetzke has taken possession of the garage and automobile repair business formerly conducted by E. H. Mann at Hebron, N. D.

F. W. Anderson has purchased the Henry garage at Coon Rapids, Ia., and will conduct a first class repair shop in connection with it.

The Warren Automobile Company, St. Louis, Mo., is temporarily located at 4376 Olive street pending the completion of its building on Locust street.

Edward Bean has opened a new garage and repair shop on Columbus avenue, New Haven, Conn. He will also use the rooms for storage purposes.

The Park Garage at South Pasadena, Cal., has undergone a change of management and incorporation papers have been taken out by the new partners.

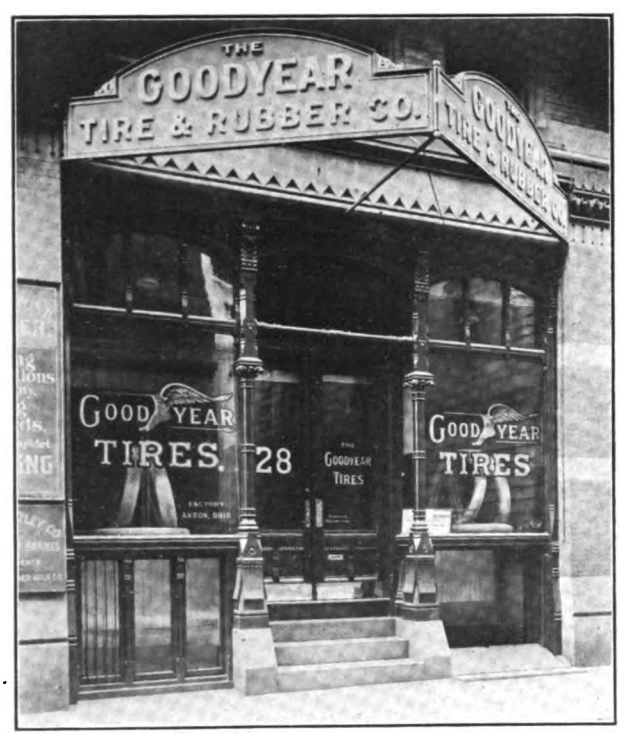
The West Shore Garage Company, New York City, has leased the building at 406-408 West 45th street, of the Duross Company and the Cross & Brown Company.

W. D. Nellis, Watertown, N. Y., is to erect a garage on Jackman street to be two stories in height. The building will be ready for occupancy in the near future.

Ralph Smalley has purchased an interest in the Eagle Grove Auto Company, Eagle Grove, Ia. He will handle

Digitized by Google

the Overland car, made by the Willys-Overland Company, Toledo, O., besides doing a general auto repairing business in connection with the garage.



The R-L Company, Boston, New England distributor of Garford cars, made by the Garford Company, Elyria, O., recently opened new salesrooms and a service plant on Boylston street. L. T. Rainier is president of the new company.

The Matthews Auto Company has moved into new quarters on South 20th street, Birmingham, Ala. The firm is composed of S. H. Matthews and Dr. J. E. Frazier, who handle the Inter-State, Firestone-Columbus and K-R-I-T.

The Oldsmobile Company of Missouri, of which Gratiot Cabanne is president, has leased for 10 years a new building of two stories and basement on Locust street, St. Louis, Mo.

A. L. Crowthers & Son, Coshocton, O., has opened a garage and salesroom and in addition to carrying the Studebaker and Flanders lines, will include several other makes of cars.

The City Hall Garage is a new establishment for the convenience of the automobile public at Saginaw, Mich.

Goodyear Tire & Rubber Company's Branch at Providence, R. I.

It is on South Washington street and is owned by Albert Marlenthal and A. Smallwood.

The Motor Car Service Station, having outgrown its old quarters at 1935 Euclid avenue, has been located at 4824 Payne avenue, Cleveland, O., by the proprietors, H. Houserman and P. G. Forbush.

Steele & Metcalf, Howarden, Ia., implement and automobile dealer, has purchased the business of Charles W. Keniston, who was in the same line. The new firm will continue the business on a larger scale.

Edward Grover and Edward Scheuer, Two Rivers, Wis., have leased a building in which they will conduct a machine and automobile repair business. They will furnish automobile parts and accessories.

The Heimsch Automobile Company, St. Louis, Mo., has purchased a plot of land on Grand avenue upon which John N. Bleeck, president of the company, and his associates plan to erect a garage and repair shop to cost $30,000.

Dr. D. F. Howard, president, and R. S. Brownlee, secretary and treasurer, have formed a stock company at Brookfield, Mo., with a capital stock of $10,000 for the purpose of building a modern garage at West Boston and Livingston streets.

John Sheridan and Albert Dennis, expert automobile men of Holyoke, Mass., have opened a garage on Main street, that city, which they later intend to remodel and extend. The plant is equipped with every modern convenience for the garage business.

The South End Garage, New Bedford, Mass., has just been completed for Manuel G. Souza. It is the first big public garage to locate in that section of the city and is equipped with every facility for the convenience of the car owner. Mr. Souza will make a specialty of supplies and repair work.

The Finch-Freeman Auto Company, Indianapolis, Ind., has established a service station for the accommodation of the owners of Regal and Nyberg cars. The second floor of the building on North Capitol avenue has been given over to this department, which is one of the most complete of its kind.

The Cadillac Sales Company, Pittsfield, Mass., has just been organized and quarters have been taken on South street in a garage recently completed. The company is managed by Roy S. Bridge and Edward A. R. Brown, who have contracted for 23 of the 1913 model of Cadillac cars, made by the Cadillac Motor Car Company, Detroit.

Frank N. Phelps, Boston representative of the Baker Electric Vehicle Company, Cleveland, O., maker of Baker electric commercial cars, has recently moved into new quarters at Boylston and Fairfield streets. In connection with this sales department a service station for New England will be conducted at 90 Chestnut street, Boston.

Island City Garage, Galveston, Tex., has been purchased by Frank Freund, George Frank and Edwin Frank, the former owner, Joseph Bader, retiring from the automobile business. The establishment will be known as the New Island City Garage and special attention will be given to the repair of automobiles and their storage.

The Davenport Auto Company, Davenport, Ia., has been purchased of Steinhauer & Frey by A. Leberman and G. V. Davis. In addition to handling the K-R-I-T, made by the K-R-I-T Motor Car Company, Detroit, the Apperson, made by Apperson Bros.' Automobile Company, Kokomo, Ind., and doing general repair work, the firm will operate a line of taxicabs.

The Atlanta Automobile Sales Company, Atlanta, Ga., composed of some of the best known and successful automobile men of that city, is a new company recently organized to handle for that territory the National, Henderson and Flanders lines. The concern is located on Peachtree street in quarters formerly occupied by the Fulton Auto & Supply Company.

The Pierson Harris Company, Inc., Atlantic City, N. J., now occupies a three-story fireproof building recently purchased at Arkansas and Arctic avenues. The firm will retain its old location at 2013 Arctic avenue for carriage and wagon work. New capital has been added and the company proposes to do only the highest class of work in automobile painting and lettering, and manufacturing tops and trimmings.

Hawley, King & Co., Los Angeles, Cal., southern California and Arizona distributors of the Oakland car, made by the Oakland Motor Car Company, Pontiac, Mich., has moved its branch store into new quarters at 1027-1033 South Olive street. Hawley, King & Co., has dealt in vehicles since 1882 and one of the chief aims of the concern is service, which will be given special attention in the new quarters.

H. W. Pierce, automobile dealer at Butte, Mont., will engage in the automobile business at Spokane, Wash., operating as the Washington Motor Car Company, jointly with his Butte place, known as the Silver Bow Automobile Company. He has the agency for the Stevens-Duryea car, made by the Stevens-Duryea Company, Chicopee Falls, Mass., and is temporarily located in the garage formerly occupied by the Pacific Motor Car Company.

W. H. Fuller, who has a showroom at Washington and Snow streets, Providence, R. I., in the centre of the automobile trade, and a service station on East avenue, Pawtucket, R. I., has taken the agency for Cole cars, made by the Cole Motor Car Company, Indianapolis, Ind., for Rhode Island, the Attleboros and Taunton, Mass. For the past four years Mr. Fuller has handled the Garford, E-M-F and Flanders lines.

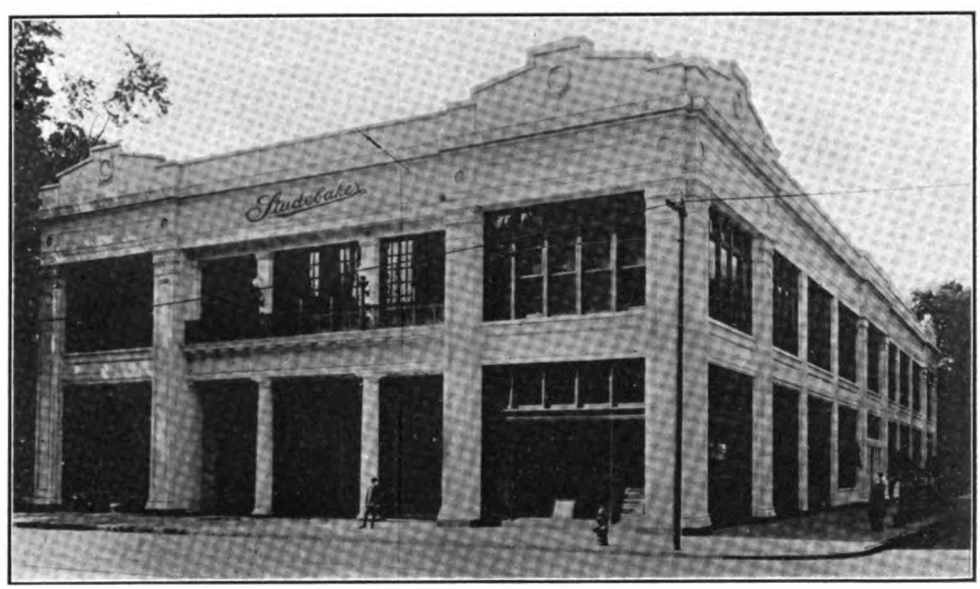
WITH THE MANUFACTURER.

The Prest-O-Lite Company, Indianapolis, Ind., has moved its Detroit branch into a new service station at 961 Woodward avenue.



The Stuyvesant Motor Car Company, Sandusky, O., is to erect a new factory at Benton, Mo. The contract for a large building already has been let.

The Oakland Motor Car Company, Pontiac, Mich., has established a factory branch at 1905 Euclid avenue, Cleveland, O., of which Fred C. Wood is manager.

C. M. Dow has joined the sales force of the Tanner Motor Car Company, Brooklyn and Long Island distributor of the Flanders-Everitt line. Mr. Dow has had many years experience in the automobile field and goes to Brooklyn direct from the Everitt organization at Detroit.

The Willys-Overland Company, Toledo, O., maker of Overland cars, has leased for a long term the entire building at 915-921 Boylston street, Boston. Improvements will be made after which the building will be occupied. There is 6000 square feet of land, with a six-story fireproof structure, especially built for the automobile business and formerly occupied by the E. R. Thomas Motor Car Company's branch.

The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, now maintains 60 branches throughout the United States, Canada and Mexico, each of which is in charge of an expert tire man as manager, who is assisted by a corps of workmen familiar with the Goodyear equipment. The object is to place at the disposal of motorists in the respective districts a service which shall be most complete in every way. An accompanying illustration presents the branch at 28 Custom House street, Providence, R. I., under the management of A. M. Bummister, and is typical of the various buildings devoted to the needs of the company in the smaller centres. Aside from the salesroom indicated, additional facilities are afforded in the rear for repair and replacement work, so that the branch becomes a service station in every sense of the word, as is true of all the other Goodyear branches.

Model Garage Erected by Studebaker Corporation, Detroit, Mich.

The E. C. Andrews Company, Boston, has located in its new fireproof building at 67 Church street, near Park square and now has increased facilities and improved equipment for handling promptly all orders for automobile tops, slip linings, envelopes, storm fronts, etc.

S. H. Humphrey, for many years prominently identified with the automobile industry, has been appointed factory manager of the Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars. He will have charge of the 1913 output.

The Atlanta Tapto Top & Trimming Company, Atlanta, Ga., which was incorporated one year ago, expects to move into new and larger quarters in the near future. The new factory will be fully equipped and will carry an up-to-date line of automobile accessories. The officers are: President, J. Richardson; vice president, G. W. Anderson; secretary and treasurer, W. H. Spratlin.

The Federal Rubber Manfacturing Company has secured quarters on North Broad street, Philadelphia, in which are located ideal sales and service rooms for the Federal line. Henry Benner is manager.

The Nordyke & Marmon Company, Indianapolis, Ind., maker of the Marmon automobiles, has established a factory branch at Kansas City, which is under the management of Fred D. Clinton.

The Locomobile Company of America, Bridgeport, Conn., maker of Locomobile cars, has opened a factory branch at 3033 Locust street, St. Louis, Mo., with A. L. Ellwood, formerly of the Chicago branch, as manager.

The Moline Automobile Company, East Moline, Ill., maker of the Moline cars, has established a branch on East Washington street, Los Angeles, Cal., and the 1913 models are being shown. O. J. Root is manager of the wholesale department and George B. Vaston has control of the retail trade.

Walter C. Barnes, Springfield, Ill., is now publicity and advertising manager of the Moon Motor Car Company, St. Louis, Mo., maker of Moon cars. Mr. Barnes was formerly connected with the advertising departments of the Illinois State Journal, Springfield, Ill., the Idaho Statesman, Boise, Ida., and the Oregon Agriculturist of Portland, Ore. During the past year he was with the Lord & Thomas agency of Chicago.

The American Auto Top & Slip Cover Company, Hartford, Conn., although established a comparatively short time, reports a rapidly increasing business and may have to expand in the near future.

The Ignition Starter Company, which manufactures the Disco starter and lighter, recently opened a direct factory branch and service station at 448-450 North Capital avenue, Indianapolis, Ind. H. L. Morgan is manager.

A. G. Bayerline has secured space in the plant of the King Motor Car Company, Detroit, where he is at work on a car which he intends to introduce in the near future. Mr. Bayerline was formerly general manager of the Warren Motor Car Company, Detroit, maker of Warren machines.

Clark A. Oostdyke, former director of purchases of the General Motors Company, has incorporated the Oostdyke Gear Shifting Company, Detroit, with $100,000 capital to manufacture a gear shifting device which does away with shifting levers on the car, the gears being operated by a keyboard on the steering wheel.

The Studebaker Corporation, Detroit, maker of Studebaker cars, will soon open a model automobile garage, salesroom and repair shop as an object lesson to the army of dealers who annually visit the Detroit plants of the concern. The establishment, as shown in an accompanying illustration, will embody every advanced idea in arrangement, labor-saving devices and other details. A. K. McLuney is manager of the garage, which will be headquarters for the recently organized Detroit branch of the corporation.

The Lumen Bearing Company, Buffalo, N. Y., is preparing an addition to the already large plant of the company. When completed the concern will have one of the largest brass foundries in the country.

SAFETY LIES IN TIRE CHAINS.

George H. Robertson, who on three successive Saturdays in the fall of 1908 won the 24-hour race at Brighton Beach, the Vanderbilt cup race and the Fairmount Park trophy, is now engaged in the automobile business in New York City. His recollections concerning the original introduction of the tire chain as a means for preventing the danger arising from skidding, will prove of interest. He says:

"I remember the time when tire chains were first brought to our notice as a skidding preventer. In fact, everyone in the trade here ridiculed the idea. However, the doubting tradesmen were invited to a comparative test held one rainy day on 'Automobile Row,' which at that time was located on 38th street. Two cars were taken, one a huge Panhard and the other a light Renault. The Panhard, which had a name at that time of being a veritable merry-go-round-on-wheels, was equipped with a set of chains on the rear wheels, while the Renault was equipped with the then popular steel-studded tires as an anti-skidding device.

"The Renault was started from Broadway towards Seventh avenue and just before it reached the avenue the brakes were applied and the car swerved smoothly and continued on for a distance of about 25 feet, while the Frenchman driving the car smiled and facetiously remarked that the old Panhard would have to 'go some' to even equal his performance. The clumsy old Panhard was started on its way and the crowd at the corner backed off so that the car would have plenty of space to swing once it got started. At the instant that the brakes were set to everyone's surprise the heavy old car stopped within a few feet without any perceptible side swing.

"The onlookers were amazed and they surrounded the car, looked everything over, felt the chains, and examined the tires. They were still unconvinced, but after a few minutes the 'doubting Thomas' demanded another test. Again the old Panhard was started off carrying as passengers this time three of the skeptics. At the corner the car was swung purposely for a skid, but it again refused. The chains held like Grim Death to a Chinaman.

"As the result of these few tests one prominent dealer ventured the expression that 'he would take a few sets and see how the darn things would take with his customers.' Suffice to say from that time on the chains sold themselves in that territory, and now the ordinary expression of 'Everybody's Doin' It' might justly be changed to 'Everybody's Usin' Them' without fear of contradiction. I know that from the time the trial was made in the 'row,' I have been an earnest advocate of non-skid chains and I believe that they should be used on all four wheels for a car thus equipped will never skid."

NEW KOEHLER COMMERCIAL CAR.

The Koehler commercial car, which is being marketed by the H. J. Koehler S. G. Company, 1074 Boylston street, and by a large number of dealers in various parts of this country and abroad, possesses a number of interesting features in design and construction. The motor is a two-cylinder, four-cycle, opposed, water-cooled unit. The transmission is of the planetary type and final drive is by side chains.

Large wheels are employed, particularly the rear driving members, which are 48 inches in diameter. It is maintained by the maker that this is an important feature, inasmuch as when the car is running at a speed of 15 miles an hour, which is the maximum permitted by the governor, the driving sprockets and chains, as well as the transmission, are running at a little more than half the speed that would be necessary with a smaller diameter wheel.

It is claimed that a distinct departure is made in the running of the planetary transmission at half the motor speed, instead of at engine speed, a gear reduction taking place between the motor and transmission. The radiator is hung on springs. The floorboard at the front of the car is all metal, and integral with it are the various control parts necessary. The designer states it is more difficult to know how to eliminate screws, bolts, etc., than to use them, but even this problem has been solved in a satisfactory manner.

WOMAN CLIMBS TWIN PEAKS.

Twin Peaks, the highest accessible point in San Francisco, has been conquered by a Flanders electric automobile, made by the Flanders Manufacturing Company, Pontiac, Mich., with Mrs. F. J. Craig driving and Mrs. J. J. Scherr as passenger. The car travelled to the end of the roadway. The achievement is notable from several standpoints, first in that the grade is not only steep, but the approach is fully half a mile, ranging from 10 to 15 per cent. and the final climb is from 15 to 25 per cent. grade, covering a total distance of two miles.

NATIONAL CONTEST AND RACING NEWS.

Mercers Take Four Out of Eight Events at Brighton Beach Meet---Rain Interferes with Programme at Rockingham Park---Stutz Victorious on Pacific Coast---Case and Simplex in Illinois---Results in Reliability Runs.

Mercer cars finished in first place in four out of the eight events at Brighton Beach, Long Island, Oct. 19, and Spencer E. Wishart would have been credited with another victory but for the fact that his machine was found to be undersize after the race was run. Neil Whalen in a National took the 25-mile contest, and Ralph Mulford drove an exhibition mile in a National, his time being 0:53.3. The summary follows:

Five Miles, 230 Inches.

Car	Driver	Time
Mason	Roberts	5:18.55
E-M-F	Chandler	
Hupmobile	Meyer	

Ten Miles, 301-450 Inches.

(Poertner Trophy.)

Stutz	Lewis	9:32.50
G. J. G.	Thebaud	

Five Miles, 600 Inches.

(Borax Trophy.)

Mercer	Wishart	4:46.25
Mason	Mulford	
National	Whalen	

Twenty-five Miles, Free-for-All.

(Robertson Trophy.)

National	Whalen	24:54.85
Mercer	Ferguson	
Stutz	Lewis	

Five Miles, Special.

Mercer	Ferguson	4:56.85
Mercer	Wishart	
Mercer	Mitchell	

Ten Miles, Free-for-All.

(Warner Trophy.)

Mercer	Wishart	10:09.85
Mercer	Ferguson	
Stutz	Lewis	

Ten Miles, 231-300 Inches.

Mercer	Ferguson	9:32.95
Bergdoll	Homan	

Five Miles, Free-for-All.

Stutz	Lewis	4:27.50
Bergdoll	Homan	
National	Whalen	

RAIN AT ROCKINGHAM PARK.

The races at Rockingham park, Salem, N. H., originally scheduled for Oct. 12, were postponed on account of rain, and when they were finally held, Oct. 19, rain again interfered with the programme after two automobile events had been run off. The results in the motorcycle races are found elsewhere in this issue, the summary for the automobile events being as follows:

Five Miles, Amateurs.

Car	Driver	Time
Mercer	Iselin	5:50
Mercer	Slater	
Buick	Bigelow	

Ten Miles, Professional.

Flanders	Higgins	13:15
Penn	Pew	
Hudson	Warren	

STUTZ AT FRESNO, CAL.

Stutz cars took two out of three races on the programme at Fresno, Cal., Oct. 12, and created a new track record for a mile, lowering Barney Oldfield's mark of 0:55.2 to 0:55. The summary follows:

Five Miles, 231-300 Inches.

Car	Driver	Time
Mercer	Weathers	5:15.5
Warren	Bravel	

Ten Miles, 450 Inches.

Stutz	Cooper	9:57.5
Buick	Denta	
Mercer	Weathers	

Twenty-Five Miles, Free-for-All.

Stutz	Cooper	24:53.5
National	Devore	

CASE AT SPRINGFIELD, ILL.

Case cars took four out of six events on the programme at Springfield, Ill., Oct. 12. Louis Disbrow in a Simplex drove an exhibition mile in 0:51.2, and with the Jay Eye See Case he created a new track record for two miles in 1:47.4. The results follow:

Five Miles, 231-300 Inches.

Car	Driver	Time
Case	J. Nikrent	5:34.75
Case	Ulbrecht	

Five Miles, 301-450 Inches.

Case	W. Endicott	5:10.00
Inter-State	Madden	
Stutz	Luttrell	

Five Miles, 300 Inches.

Case	Ulbrecht	5:13.20
Case	J. Nikrent	
Staver	Monckmeier	

Three Miles, Over 301 Inches.

Simplex	Disbrow	2:56.80
Case	W. Endicott	
Hotchkiss	Kilpatrick	

Ten Miles, 601 Inches.

(Illinois Championship.)

Case	J. Nikrent	10:28.50
Stutz	Luttrell

OLDSMOBILE WINS HERRIMAN CUP.

Seventeen cars took part in the annual century run of the Long Island Automobile Club, Brooklyn, N. Y., for the Herriman trophy early in the month. This was a non-stop run, and points were awarded for work done on the road, as well as lateness at controls. G. F. Hunter in an Oldsmobile finished with a score of 999, while Herbert G. Andrews in a Buick had 998.

ST. LOUIS RELIABILITY RUN.

Twenty-five of the 26 cars which started in the fifth annual owner's reliability tour of the Automobile Club of St. Louis, completed the 110.2-mile run without difficulty. There were two classes and the winners were as follows: Class A, Barnard trophy—First, A. H. Ahrens, Franklin, 993; second, S. S. Pingree, Amplex, 991. Class B, Pingree trophy—First, E. A. Limberg, Locomobile, 998; second, James Hagerman, Jr., Marmon, 993.

William Schimpf, Chairman of the Contest Board, American Automobile Association, in His National Roadster.

ENTRIES FOR DESERT RACE.

Twelve entries for the Los Angeles-Phoenix desert road race had been filed at the time of closing, Oct. 10, as follows: Three Cadillacs, two Americans, Buick, Franklin, Schacht, Simplex, Hupmobile, National and Mercedes. The race starts from Los Angeles, Oct. 26. It was won last year in a National driven by Harvey Herrick.

GLIDDEN STARTS ALONE.

The attempt of Charles J. Glidden, donor of the Glidden trophy, to awaken interest in an unofficial tour over the route from Detroit to New Orleans, which was to have been used for this year's national tour of the American Automobile Association, does not appear to have been an entire success. However, Mr. Glidden kept his promise to start Oct. 14, driving a Maxwell car, and was accompanied by M. R. Newton, advertising manager for the United States Motor Company, and Charles Walls, one of the drivers in the winning Maxwell team last year.

OTHER AMENDMENTS IN JERSEY.

J. H. Lippincott, state commissioner of motor vehicles in New Jersey, is said to have prepared a new amendment to the motoring law in that state, designed to deal with visitors who violate the provisions of the so-called reciprocity act. It is understood that it will require garage proprietors and dealers to take note of all cars entering and leaving their places, and have these reports ready so that state inspectors can check up the number of times non-resident owners have been in the commonwealth. Two other amendments also are suggested. One of these proposes to simplify the lighting section so that the rear lights shall shine more clearly on the license numbers. The other will provide for a fine of $200 for any machine bearing a registration that has been blacklisted whenever such car is brought into the state.

It would seem from this information that the automobile industry has by no means heard the last of motoring legislation in this commonwealth.

MOTOR CAR ANATOMY.

The Buckeye Manufacturing Company, Anderson, Ind., maker of the Lambert friction driven pleasure and commercial vehicles, is issuing a neat, cloth bound book of 106 pages entitled "Motor Car Anatomy." It is by Franklin Pierce and deals with the components of the motor car, explaining each in non-technical language. The book is liberally illustrated by colored half tones as well as line cuts and diagrams. Many valuable suggestions for selecting and maintaining a car are given and throughout the subjects are handled in an able manner.

WEED CHAINS
PREVENT ACCIDENTS LIKE THIS

What an awful game of chance we sometimes play on the checkerboard of Life!
How narrow is Life's victory over Death at times!
What a contrast is here presented! What an object lesson this scene portrays!

Absolute control and **perfect safety** on the one hand; on the other an "unruly, balky" machine, whose seemingly greatest ambition was to bring its occupants face to face with disaster.

Picture for yourself the story:

Two cars traveling the same country road—a rainstorm overtakes them. Reaching a treacherous, slippery curve—

ONE CAR with scarcely any noticeable slackening of speed rounds the curve and **passes on in perfect safety.**

THE OTHER at the critical moment, **skids,** and in a flash, plants itself in front of the on-rushing trolley.

A mass of wreckage, "nerve-shattered" passengers and a lasting memory of what might have been if the trolley car had not been stopped.

One Car was skid-proofed with Weed anti-skid Chains. **The Other** was not. Take the lesson home.

Weed Chains

Absolutely Prevent Skidding

Are you still taking your life in your hands by refusing to take the necessary precaution against the dangers of skidding? Are you still unwisely depending on "rubber alone" for the safety of yourself, the occupants of your car and other road users?

Make safety yours—take no chances. Fully equip your own car with Weed Chains today and **insist,** for your own protection, that other drivers do the same.

Weed Chains cannot injure tires because "they creep;" are put on in a minute without the use of a jack or other tools. Use them on all four tires.

The Features the Buyer Wants in Distinctive and Distinguished Cars

CROXTON

Croxton Cars incorporate all of the features for which the buyer looks in the new season models.

Moreover, many of these have been in use on our cars for five years; so, with us at least, they are not experimental.

Others—which some day we predict will be widely adopted—are yet exclusive to the CROXTON.

These are even more valuable to you in a sales way than those which have now become more or less common in other cars.

A glance at what follows will show you that no car is more complete, of more advanced design or more completely equipped:

Short Turning Radius.

Extremely long and flexible Springs.

Quick Detachable Demountable Rims.

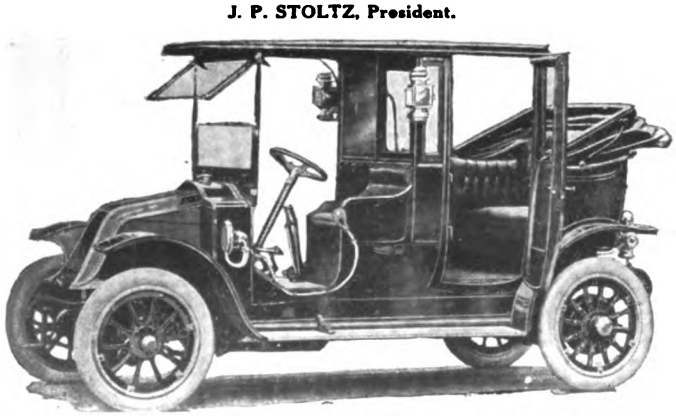
Electric Starting and Lighting System.

An extremely long stroke motor; improved ignition system with automatic spark advance, dispensing with spark lever on steering wheel.

Improved Thermo-syphon cooling system.

Radiator protected from damage and from mud and water splashing by being placed at rear of motor; no hot air from radiator passes over motor. Improved oiling system. Left hand drive with steering gear of new design. Centre control. Clutch and transmission enclosed as a unit. Gasoline tank incorporated with cowl dash. Motor protected by hood from dust, dirt and water.

Particularly attractive and distinct body lines.



We are now located in our new factory with the best and latest machinery and most complete facilities.

Our Sales Force is yet to be completed by the addition of a few good dealers.

Full details and specifications will be mailed for the asking.

Electric Star Auto Headlights and Tail Lamps

The lamp that has no rivets nor solder, and only one screw used in its construction. It is made of cast silvered aluminum, and the interior is highly polished, which does not tarnish. The convex lenses are laid in rubber, which makes them water and dust proof, and same is the strongest lamp made. Write for cataogue. Mfd. by

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. **TRY THEM NOW.**

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that **"Invader"** Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

When Loss of Seconds Means Loss of Lives

You have read of many instances where the loss of a second resulted in accident and loss of life.

Eliminate this danger by equipping your car with an Electric Self Cranker.

It is instantaneous, absolutely sure, economical, convenient and clean.

If your car stalls, just push a button and go ahead, leaving danger behind.

"Dead centers" cut no figure with good Electric Cranking Systems; they start your car always---in summer or in zero weather.

But the heart, the brains and the initial energy of every one is a reliable Storage Battery.

That's why 90% of all the manufacturers equip Electric Cranking and Lighting Systems with

GLBA

STORAGE BATTERIES

Use the Class A GLBA With an Electric Lighting Generator.

Use the Class B GLBA With an Electric Self-Starter.

Write us for full information.

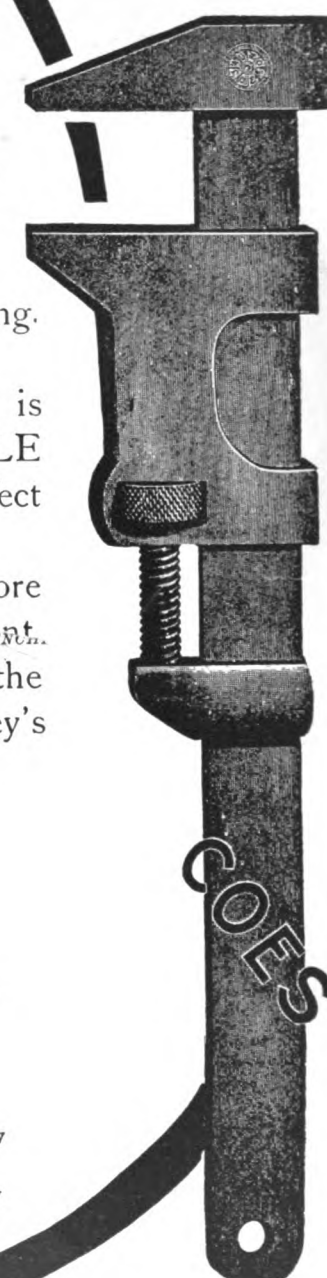
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

You Can Get

Greater power, more mileage and perfect lubrication if you use---

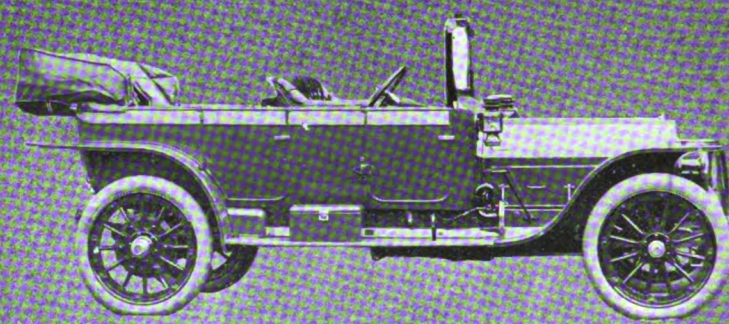
HARRIS

TRADE MARK REG. U.S. PAT. OFF.

OILS

This is an acknowledged fact. The reason is obvious. HARRIS OILS are the result of over a quarter of a century of experience in the making of high-grade cylinder lubricants.

HARRIS OILS have been the leading lubricants since the inception of the automobile. Only the highest grade of Pennsylvania Crude Stock is used. The damaging soot-deposit forming ingredients are eliminated to the greatest possible extent.



Motorists who use HARRIS OILS once —never use any other brand. The difference in the engine, the difference in the cost for up-keep, the difference in power and speed is so apparent that once used---HARRIS OILS are always used. They are truly the highest in quality of all automobile lubricants.

Cameron's Great Car Find a "40" Like It

There are 72 makers this year building Forties. For legions of motorists are demanding cars of reasonable size and power.

Each of these makers strives in some way to outdo the others. As a result, some of the most luxurious cars ever built are now in the Forty class.

And prices on "40's," since this war began, have been fairly cut in two. So some of the greatest values in Motordom now are in 40-horsepower cars.

Find if you can, among our 72 rivals, any value that compares with this.

300 Improvements

We have spent four years on the Michigan "40." We have sent out and watched 5,000 cars. We have worked out some 300 improvements.

Our engineer-in-chief is W. H. Cameron, who has built 100,000 cars.

For body designer we have John A. Campbell, whose body designs are used by kings.

Each part and detail is built by an expert, picked out by Cameron. After four years, the result is one of the greatest cars that ever went out from a factory.

Electric Lights---Four Speeds Big Tires---All for $1,585

In the Michigan "40," W. H. Cameron reveals his splendid genius.

He has given you safety, by making all driving parts sufficient for a 60 h. p. car.

He has given you economy by using extra wide tires. He has given you comfort by his 14-inch cushions, by wide, long springs, and by unusual room.

He gives you the luxury of hand-buffed leather, and a 22-coat body finish.

He gives you four forward speeds, extremely rare in cars under $3000. He gives you electric lights.

And, by enormous output and model equipment, we have made it possible to give you all this for $1,585.

What Other Car Compares?

What other car in the whole Forty class gives you this much value?

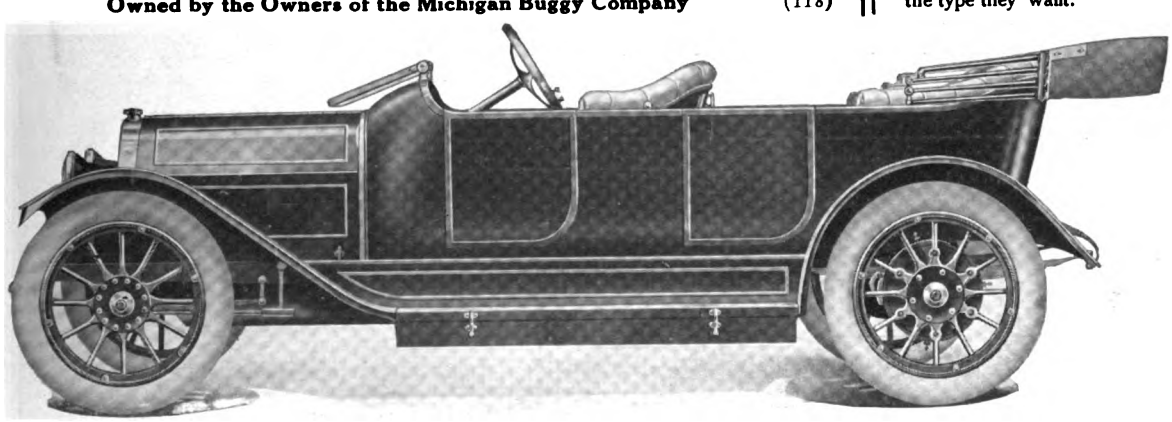
Make your comparisons. Watch all the costly features in which makers skimp. See if any car, built by able men, makes an offer this year which compares with this. That is the way to get the utmost from this war of Forties.

Write for our 1913 catalog, and we will tell you where to see this car.

Michigan Motor Car Company, Kalamazoo, Mich.

Owned by the Owners of the Michigan Buggy Company (118)

Michigan "40"



$1,585

With All These Special Features:

Four forward speeds, like all leading foreign cars.
Electric lights with dynamo.
Oversize tires—35x4 1-2 in.
40 to 46 horsepower.
Cylinders—4 1-4x5 1-4.
Wheel base, 118 inches.
Rear seat, 50 in. inside.
Cushions, 14 inches deep.
Centre control.
Left side drive.
Brakes extra efficient—drums 16x 2 1-4 inches.
Springs 2 1-4 in. wide, 37 and 50 in. long.
Firestone demountable rims with extra rims.
Steering post, clutch and brake pedals all adjustable to fit any driver.
Body finish 22 coats.
Nickel mountings.
Electric headlights, very powerful, 12 1-2 in. diameter.
Sidelights flush with dash.
Windshield built in.
Mohair top, side curtains and envelope.
Electric horn.
$50 4-inch Speedometer.
Foot rail—robe rail.
Rear tire irons.
Tool chests under running boards.
An average of 50 per cent overcapacity, to allow big margins of safety.

Self Starter

Either gas or electric, furnished at moderate extra price. We do not include it because men differ about the type they want.

Your Safety

Actually Depends on Quick-Acting Brakes

TRADE MARK
Raybestos
REG. U.S. PAT. OFF.

"The Original and Best Asbestos Brake Lining"

No other lining compares with RAYBESTOS because no other lining has the same high QUALITY. RAYBESTOS is made of the finest long-fibre asbestos—which gives longest wear and maximum efficiency.

RAYBESTOS is woven in special looms. It is treated and finished by a secret process known only to the manufacturers. Every inch of RAYBESTOS is subjected to gruelling scientific tests before being shipped. If the fabric does **not** show **100 per cent. efficiency** it is rejected.

The result is that RAYBESTOS not only outwears and outlasts every other lining, but gives a much greater coefficient of friction and offers the car owner a higher factor of safety than can be obtained in any other way.

Raybestos Is the Quality Lining of the Industry

Demand and insist upon getting Raybestos. Do not accept cheap imitations. The name "Raybestos" is stamped in every foot for your protection. Look for it.

The Royal Equipment Co. **422 Housatonic Avenue BRIDGEPORT, CONN.**

We also make Duplex and Raymond Brakes, and Gyrex, the Mixer.

Warner AUTO-METER

THE big American automobile manufacturers in 1913 for the first time acknowledge the necessity of equipping their cars with an accurate speed and mileage indicator. After the most exacting series of tests they have virtually made a unanimous selection.

The WARNER AUTO-METER is recognized as the world's OFFICIAL and standard speed and mileage indicator. Manufacturers planning full equipment sought the best indicator. They invited tests. It was the survival of the fittest.

The Warner Auto-Meter won. It won although the highest in price.

Practically all the prominent cars for 1913 are equipped with Warner Auto-Meters. The majority of the highest grade cars are Warner equipped. Over 100,000 new cars will be Warner-equipped this year.

Examine the speed indicator on your prospective car. It is an indication as to the quality of the whole car.

Priced from $50 to $145. For sale at our branches and by leading dealers all over the world.

Handsome catalogue on request.

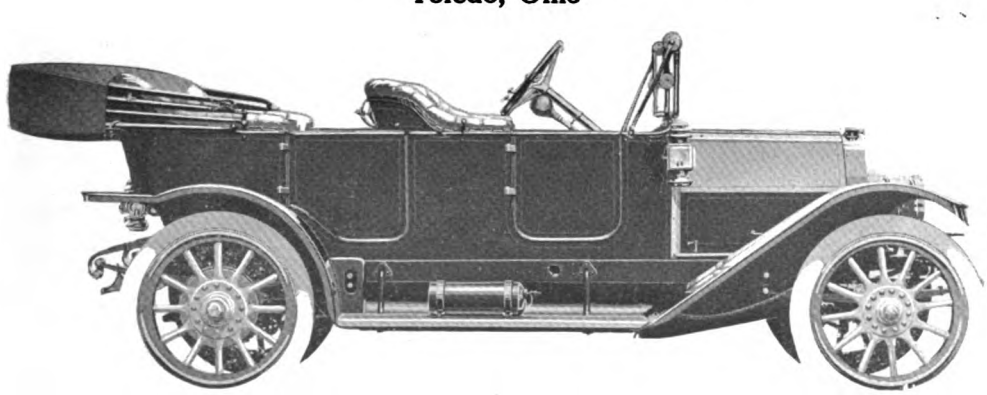
High-priced feature No. 1

Popular-priced makers consider semi-floating rear axles well enough. We do not. Overland Model 69T axles must be better---*THREE-QUARTER FLOATING.*

The Overland three-quarter floating axle causes the weight of the car and its load to rest on the axle housing---reinforced by an inner steel tube, riveted and keyed to the housing.



Advantage?

In the ordinary semi-floating axle the weight of the car and its load is carried half and half on the axle shafts and housing. Hence, the axle not only does the wheel driving, but must carry, also, part of the great weight. Result---excessive strain and friction, most surely causing disalignment of bearings. More repair expense.

High-priced features in a low-priced car. This is one of the features that make the Overland the greatest value in the world. Let us send you a catalog which explains in detail the many other high-priced features. Please address Dept. 52.

WHITE TOWN CARS

Built Particularly For Women

THE White Forty Coupe is the pioneer woman's gasoline car. To the woman who drives, it offers the touring radius and flexible speed of the gasoline roadster, combined with the comfort, safety, and ease of operation of the electric brougham.

The left-side drive admits of easy access to the driving wheel from the curb. The White Electrical Starter, positive under all conditions, not only is operated by one simple motion from the seat, but also renders impossible the inconvenience of the engine being accidentally stalled. The lighting of the car, electric throughout, is likewise controlled from the driving seat.

The first of its kind, the White Coupe is the recognition of woman's demand for a clean, safe motor carriage for town and suburban use, having the grace, speed, and radius of travel which only a gasoline car can give. White Coupes are built in Thirty, Forty, and Sixty horsepower models.

THE AUTOMOBILE JOURNAL

VOL. XXXIV, No. 7 NOVEMBER 10, 1912 Price, $1.00 the Year

PIONEER AMERICAN GASOLINE CARS.

Early History of the Industry and Some of the First Machines Which Proved Practical—Indicating the Progress in Design and Construction.

UNDOUBTEDLY there was much experimentation and development, which never has been brought to the attention of the general public, before the advent of the first practical American gasoline automobile. It is extremely improbable that even those earliest machines, now regarded as the pioneer productions on anything even remotely resembling a commercial basis, were carried through from original design to the completed vehicle without many disappointments and failures. There always will be dispute as to the identity of the real pioneer constructor, but considering only those creations which are readily conceded to be the forerunners of the present day motor car, the history of the gasoline autmobile industry in America may be said to date from 1891.

First Practical American Gasoline Automobile, Produced by Duryea in 1892.

Steam and electric machines were produced in this country, as they were abroad, many years prior to the invention of the Beau de Rochas cycle in France in 1862. This principle was first applied to a gas engine by Dr. Otto in Germany in 1877. Because of its application in the Otto-Crossley engine, this four-stroke cycle has come to be known in the industry as the Otto cycle.

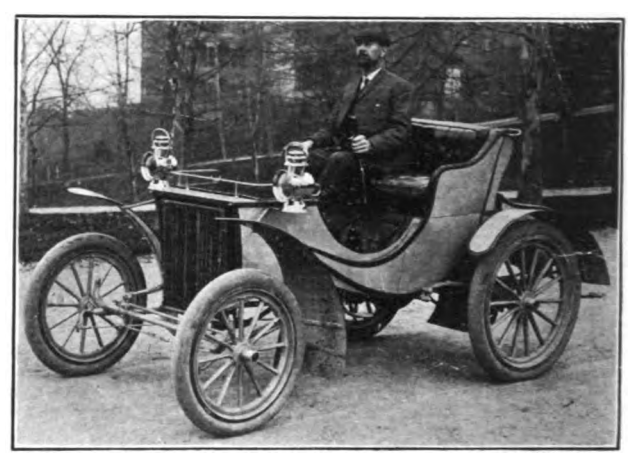
It was while he was engaged with Dr. Otto in experimental work that Gottlieb Daimler produced the first internal combustion engine in

Digitized by Google

Duryea Motor Wagon Model 2, Winner of Chicago Times-Herald Race of Thanksgiving Day, 1895.

1884. The following year Daimler applied his engine to a bicycle, and this is regarded as the first practical gasoline propelled road vehicle. Other installations followed, and three and four-wheeled vehicles were produced abroad before any made their appearance in America. There is quite as much rivalry in Germany as to the identity of the real pioneer, both Daimler and Benz contending for the honor.

Meanwhile, American engineers were experimenting motors of various types. The Brayton two-cycle engine was patented in 1872, but it does not appear that any attempt was made by the inventor to apply this to a road vehicle. George B. Selden made application for the patent, which later was to exert such a wide influence upon the industry, in 1879, although he had been engaged upon the preliminaries for two years before that. In this he made use of an adaptation of the Brayton engine. This patent was granted in 1895, and somewhat more extended

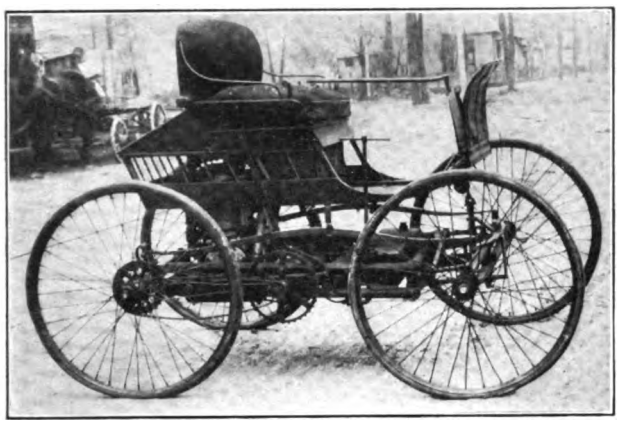


Third Model Produced by Duryeas, One of Which Won the Cosmopolitan Race of Memorial Day, 1896.

reference will be made to it in a subsequent installment of this discussion.

That other American experimenters were engaged upon the problem of engine design is borne out by the large number of patents issued by the United States patent office during the years immediately preceding the appearance of the first gasoline propelled road vehicles in this country. Most of these followed the principles adopted by Otto rather than those worked out by Brayton. The former was of the constant volume type and the latter of the constant pressure. In the Brayton there was no explosion, the gas issuing from the container burning all the time it was entering the cylinder. In the Otto the combustion was more rapid, the charge burning so quickly as to justify the term "explosion engine."

In 1886 Charles E. Duryea decided upon the internal combustion motor as the most efficient



Charles E. Duryea Driving the First Three-Cylinder Car, Constructed by Him in 1898.

means for road vehicle propulsion. It is stated that the first successful engine of this type made in America was produced by A. J. Pierce at Sterling, Ill. As a result of this and because of the fact that Pierce later was engaged in the manufacture of gasoline automobiles, there has been some disposition to question the priority of these two designers. It ought to be mentioned that Elwood Haynes was engaged about the same time in the design and construction of a machine, and his name also is to be included in the list of pioneers.

It was in the summer and fall of 1891 that actual work was begun on the original Duryea motor wagon, and inasmuch as it was the first gasoline propelled horseless carriage to make its appearance in public and the first to be offered for sale, the gasoline automobile industry as such

Digitized by Google

Original Car Completed by Elwood Haynes in 1893, and First Operated Successfully, July 4, 1894.

must date its beginning therefrom. This first machine was completed early in 1892, and is shown herewith.

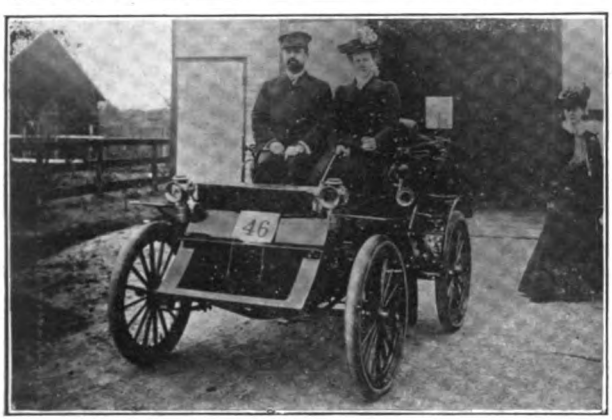
It will be noted that the body construction was in every way similar to that of the old horse phaeton buggy. The motor was a single-cylinder unit, fitted with a governor, so that changing speeds and steering were the only necessary operations. The motor drove a variable speed friction device, and power was transmitted to the rear wheels by a countershaft and double chains. A sidewise movement of the tiller steered the vehicle, while an up-and-down motion changed the speed—the original one-hand control. Carburetion was by a spray mixer and ignition was by electricity, a decided improvement over Daimler's original application of the hot tube ignition. The road wheels appear to have been unchanged from regulation horse wagon design, and spiked iron tires were utilized to give traction in snow and ice.

J. Frank Duryea, a brother, was identified with the production of this first machine, and also with the second of the same model, which was completed in 1893. This car saw considerable service, and offered a substantial basis for further experimentation.

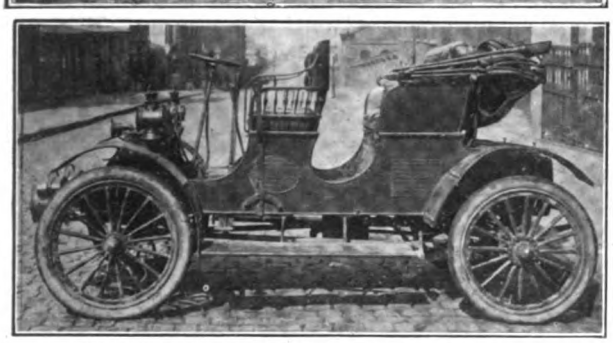
In the fall of 1893 the two brothers perfected their new design and what may be regarded as the Duryea motor wagon model 2 was produced in 1894. This also is shown and it will be seen that it differed materially from the original type. The body construction was much more distinctive, the curve of the dash being with a view to providing a place for carrying parcels, etc. It also had pneumatic tires, and is claimed to be the first automobile in the world to be thus equipped.

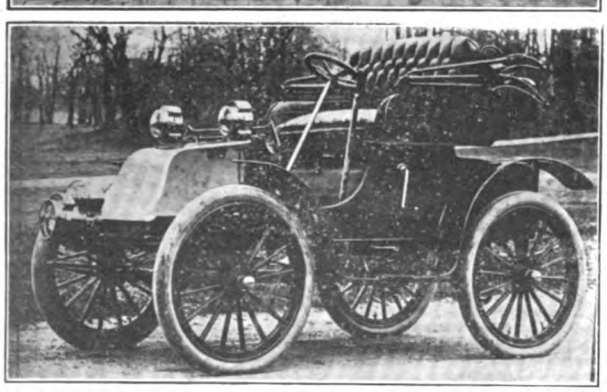
The motor was a two-cylinder opposed unit, and the bevel gear transmission gave three forward speeds and reverse. Cooling was by water, the tank being located forward under the floor, where it was exposed to the air. The motor and crankshaft were placed lengthwise of the car, and power was transmitted to a live rear axle by means of a single chain and large sprocket. The variable governor acted upon the inlet valves of the motor, and provided a means for throttling to a limited extent.

The car shown won the Chicago Times-Herald race of Thanksgiving Day, 1895, being driven by J. Frank Duryea, the first prize for which was $2000. The distance was 52 miles, and much of the road was covered with deep snow. The machine was used all of 1895, 1896 and 1897, and at the end of that period was sold for $1000 at second hand.



Automobile racing was of decided value at that early date, it would appear, as experience with this Duryea suggested smaller wheels, larger tires, longer wheelbase, lower centre of gravity,





First Haynes Model Produced on a Commercial Basis in 1899, Leading Other Cars of That Period About to Start on a Run.

Digitized by Google

Early Haynes Models: From Top to Bottom—Tonneau, 1899; Two Seats, 1900; A, 1901; H, 1902.

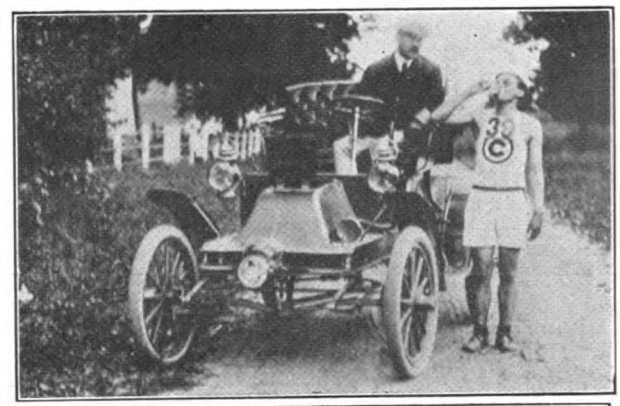
more power and more perfect throttle control. All these features were incorporated in the third model produced in 1896. A comparison of this vehicle with that which immediately preceded it will indicate several refinements in body design, as well. Fenders were placed over all four wheels, full elliptic side springs took the place of the end springs at the rear and a headlight was added.

Four of these machines were entered in the Cosmopolitan race from New York City to Irvington-on-the-Hudson and return, about 50 miles, Memorial Day, 1896. Three of them were the only contestants to return the same day, winning all the prizes, $3000. A car of this model also won the Liberty Day run from London to Brighton, England, Nov. 14, 1896, defeating the winners in the first, second and third French races by over an hour on a 52-mile course.

Several of these vehicles were marketed. One of them was purchased by George H. Morrill of Norwood, Mass., and became the first machine to be shown publicly on the streets of Boston. On one of his first trips down Boylston street, Mr. Morrill felt obliged to employ a flagman to walk in front of the car. This certainly does not speak very highly of its speed possibilities, despite the fact that the Duryea motor wagon of 1896 will long be remembered as the winner of the Cosmopolitan race of that year. P. A. Lewis, who opened the original Automobile Headquarters on Stanhope street in Boston about 1900, also owned one of these early Duryea cars and exhibited it at all sorts of agricultural fairs throughout the East.

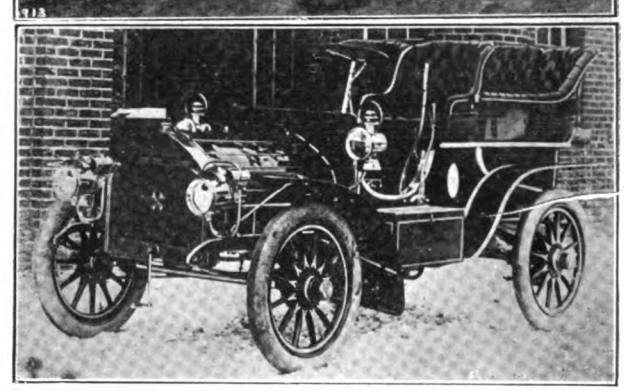
In 1897 the two brothers separated, J. Frank Duryea becoming associated with the interests now forming the Stevens-Duryea Company in Chicopee Falls, Mass. Their experiments had been conducted in Springfield and Chicopee for a number of years, practically since the appearance of the first successful car. Charles E. Duryea returned to Reading, Penn., and continued experimentation along his own lines. He is now president of Duryea Motor Company at Saginaw, Mich., and is still producing Duryea motor vehicles.

Following the separation, the fourth model made its appearance in 1898. This had a three-cylinder motor with flywheel concentric with the motor shaft, planetary transmission, and other features which are apparent from an examination of the accompanying illustration. It is held to be the first car with more than two cylinders, and to be as great an advance over previous machines as the six-cylinder car was over the four in its day. Moreover it was a block motor, the three

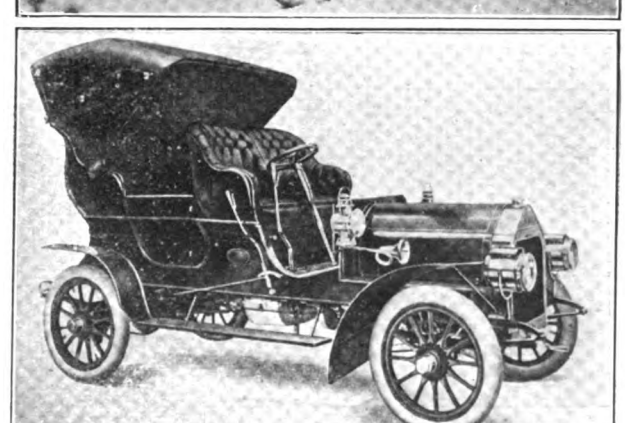


Digitized by Google

cylinders, their water jackets and valve chambers being cast integral. The three water jackets were continuous, having common inlet and outlet ports, and they only covered the combustion space, the theory being that too much cooling is hostile to economy and efficiency, particularly at slow speeds.

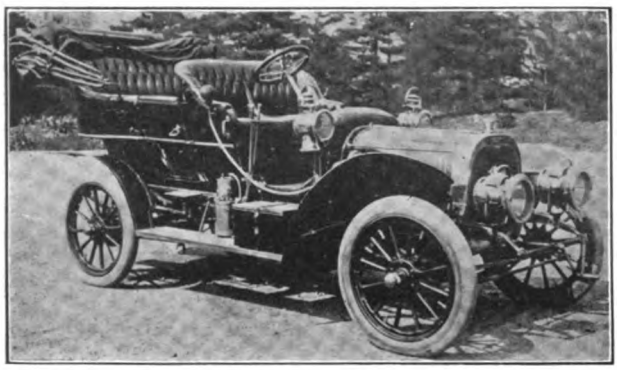


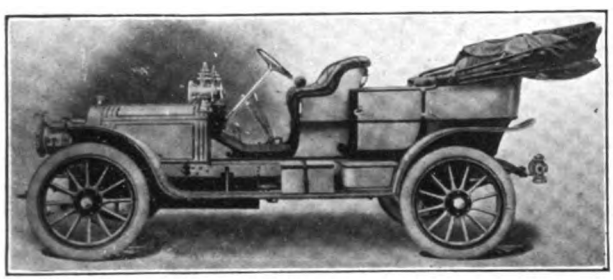
The ignition was by primary spark, the current being supplied by a magneto generator driven from the flywheel. One pole was grounded on the frame of the motor, while the current from the other was carried by two insulated anvils let into the walls of the combustion space. A rocking contact breaker or hammer, pivoted in the exhaust valve stem and caused to oscillate by a pawl extending over the camshaft, was lifted at the proper instant by a cam shaped for the purpose. The lifting of this pawl brought the sparking hammer into contact with the insulated anvil, completing the circuit.

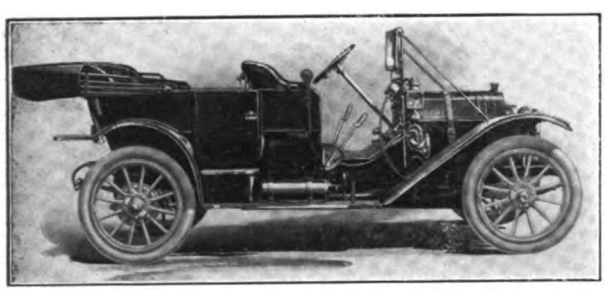


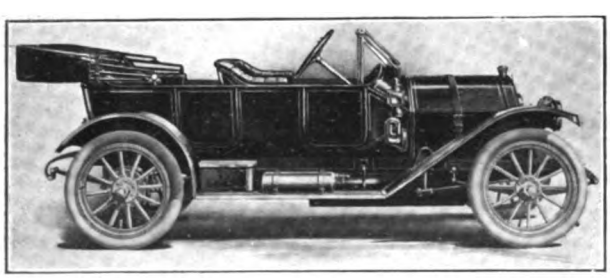
Perhaps the product of no concern in the industry better illustrates the progress made than that of the Haynes Automobile Company, Kokomo, Ind. Elwood Haynes designed his first machine in 1891 and 1892, and it was finished as shown in an accompanying illustration in 1893. It was successfully operated for the first time July 4, 1894. After that came a period of further experimentation and the soliciting of support from the Apperson brothers, which resulted in the production of machines on a commercial basis in 1899, under the name of Haynes-Apperson. Later the Apperson Bros.' Automobile Company was formed for the manufacture of Apperson cars, while the Haynes was continued by Elwood Haynes and his associates under the name of the Haynes Automobile Company. The present models are still constructed under the personal direction of Mr. Haynes, and the photographs reproduced herewith present in a graphic manner the development and progress of the industry.

Comparison of the original Haynes with the first car produced by Duryea will indicate that decidedly more attention was paid to the matter of general design, although Haynes appears to have utilized an ordinary wagon body, and regulation bicycle wheels were employed. The body was mounted on two semi-elliptic side springs 50 inches long and the frame was made of tubing. The axles, front and rear, were solid bars. The motor was a single-cylinder unit, rated at one horsepower, with bore and stroke of four inches. Power was transmitted through a contracting band clutch to a two-speed transmission, which provided for no reverse, and no brakes were fitted, it is understood.

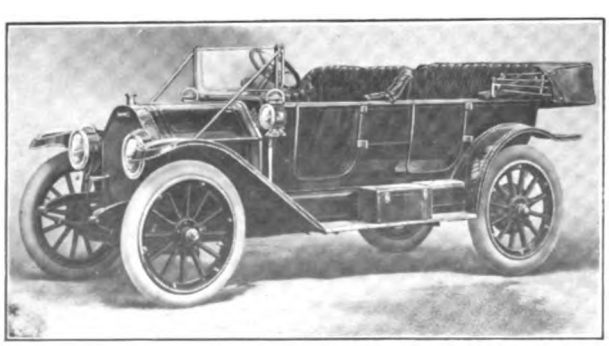








Additional Haynes Models: Reading Down—I, 1903; First F, 1904; Second F, 1904; K, 1905.



Digitized by Google

Later Haynes Cars: From Top to Bototm—Model R, 1906; Model W, 1908; Model 19, 1909; Model 20, 1910; Model 21, 1911.

The model of 1899 is presented in two views, in one of which it is shown at the head of a long line of other cars, evidently about to start on some kind of a run. The photograph was taken in 1899, but the information concerning it is not available from the Haynes company. The car was not the first to be provided with a tonneau, a Winton claiming that honor, as will be brought out later. The other view shows the top raised and gives a much better idea of its general appearance.

Apparently the tonneau feature was discontinued on the 1900 model, as the photograph presented shows a two-seated vehicle in front of the garage of an early motoring enthusiast. This brings out the left hand drive, which seems to have been adopted in all the early Haynes models. Tiller steering also was a prominent feature on these cars.

Three models were produced in 1901, A, B and C. That shown is model A. In some of these vehicles the tiller steering is retained, but the wheel appears for the first time in this year. Left hand drive is continued. Model B was a two-seated machine, but seems to have had all the other characteristics of the A. Model C also was a two-seated machine and was supplied with a top.

Model H appeared in 1902. This seems to have been a continuation of the model C with several refinements. A longer hood was fitted and the steering post was given a decided angle. The whole design made for increased comfort and convenience. Model I of 1903 does not appear to differ materially in general appearance. The photograph was taken during the progress of a marathon run or some other contest of that nature.

Model J was produced in 1904. This was a two-seated machine with decidedly advanced lines. Model F also appeared in that year, and two views of it are shown, indicating the two very different types of radiator fitted. This seems to be the first placing of the motor under hood, following the conventional practise of today. Model K was a 1905 production, and for the first time the driver was placed on the right.

There does not appear to have been any distinctive model in 1907, or at least the company is unable to locate a photograph of it. The other machines reproduced bring the line down to date, with the exception of the latest vehicle, and indicate in a decidedly interesting manner the rapid progress made by the industry during the past few years.

(To Be Continued.)

MAKING THE CAR READY FOR WINTER.

Attention Necessary and Methods That Will Facilitate the Overhaul---How a Machine Should Be Prepared for Storage to Prevent Deterioration.

REFINEMENTS in body design, including the fore door and cowl dash, improved tops and close fitting side curtains, inside control, demountable rims, electric lighting, motor starters, etc., all make for comfortable operation under all weather conditions. As a result, it is not at all surprising that the number of motorists who keep their machines in service throughout the entire year is increasing very rapidly.

Despite these modern conveniences, however, certain precautions must be taken to insure proper service during severe weather. Careful motorists take advantage of this period to give the car a systematic overhaul. This preparation for the winter months, while it should be thorough, need not involve any great labor or expense. The number of automobilists who accomplish their own overhaul is increasing each year, and for the benefit of the new owners, particularly, the following suggestions should prove of interest and value.

Effect of Cold on Parts.

The necessary work involved will depend largely upon the car's age and condition. Machines which have seen considerable service will require more attention than those which have been driven but a few thousand miles. In the latter event it is probable little will be necessary other than cleaning out the carbon, grinding in the valves and making minor adjustments.

The car that has been operated for several seasons should be given careful attention, more so than the late models in which the maker has incorporated high grade alloys, as well as means for taking up components subject to wear. While low temperatures may be said to have little if any

SCHEDULE OF NECESSARY STEPS IN THE FALL INSPECTION.

OVERHAULING THE CAR.

The Power Plant.
- Clean Circulation System.
- Remove Old Grease and Dirt.
- Clean Lubricating System.
- Adjust Bearings.
- Remove Carbon Deposits.
- Grind Valves.
- Retime or Check Valve Timing.
- Clean Carburetor and Fuel System.
- Examine Wiring and Terminals.
- Clean Spark Plugs.
- Test Gaskets or Packings for Leaks.
- Try Nuts and Bolts for Looseness.
- Refill Crankcase and Oil Reservoir.
- Renew Lubricant in Grease Cups.
- Examine Water Connections.
- Anti-Freezing Solution (Optional).

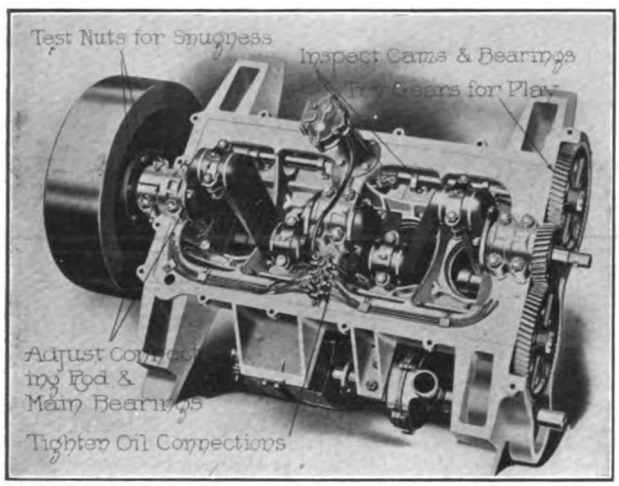
Clutch.
- Examine Bearings for Wear.
- Renew Clutch Lining if Needed.
- Wash Out Multiple Disc Type with Kerosene.
- Refill Housing with New Lubricant.
- Adjust Clutch Spring or Springs.
- Reset Clutch Stop.

Transmission.
- Remove Old Lubricant.
- Inspect Gears and Bearings for Wear.
- Try Action of Shifting Forks.
- Oil Shifting Lever Mechanism.
- Refill Casing with Lubricant.

Differential.
- Clean Out Old Lubricant.
- Adjust Bearings
- Try Drive Shaft for End Play.
- Renew Lubricant.

Rear Axle.
- Examine Brake Linings.
- Renew Facing if Necessary.
- Test Action of Brake Mechanism.
- Clean Bearings, Renew Grease and Adjust.
- Tighten Radius Rods, Fender Irons, Nuts, Etc.

Front Axle and Springs.
- Tighten Spring Clips.
- Examine Spring Shackles.
- Align Wheels if Necessary.
- Inspect Steering Linkage.
- Clean Bearings, Renew Lubricant and Adjust.
- Refill All Grease Cups.
- Clean and Lubricate Springs.



Steering Gear.
- Test for Lost Motion.
- Examine All Connections.
- Inspect Pivot Pins and Bearings.
- Adjust Bearings.
- Renew Lubricant and Replace Grease Boots.

Wheels and Tires.
- Remove Tires and Clean Rims.
- Inspect Shoes for Cuts, Etc.
- Examine Tire Chains.

PUTTING THE CAR AWAY.

- Remove All Accessories.
- Wash and Dry Body and Gear.
- Clean Top, Curtains and Upholstery.
- Clean Circulation System.
- Empty Components of Water.
- Clean Chassis.
- Loosen Fan Belt Tension.
- Relieve Valve Spring Tension.
- Use Kerosene in Cylinders.
- Release Clutch Tension.
- Remove Tires and Clean Rims.
- Clean and Wrap Shoes and Tubes for Storage.
- Empty Water from Generator.
- Jack Up Frame to Remove Weight from Springs.
- Cover Body, Top and Chassis and Darken Garage.
- Clean and Store Accessories.
- Make Periodical Inspections.

Showing Bearings and Components of Motor Which May Need Adjusting.

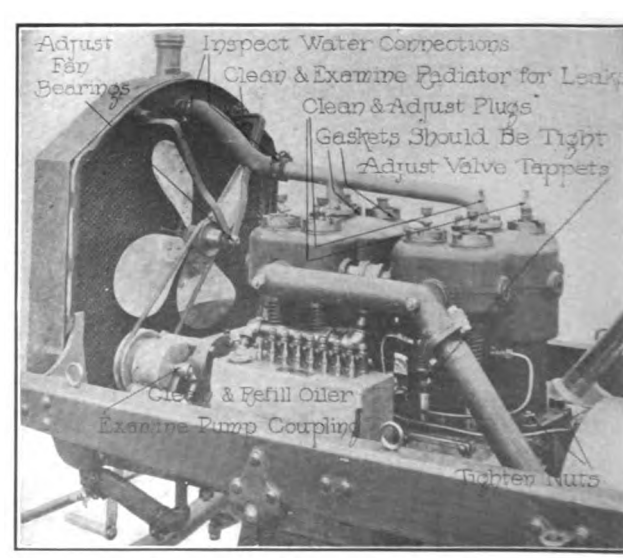
effect upon the static strength of steel the repeated application of stresses, none of which is equal to the carrying strength, due to loose or worn parts, may result in rupture. In other words, a succession of shocks or impacts, none of which alone would be sufficient to break a piece of metal, will cause deterioration and subsequent breakage.

Components Requiring Attention.

Too much emphasis cannot be laid upon the importance of the steering gear mechanism, the failure of any part of which is, without exception, the most serious accident which can occur to a motor car. For the benefit of those not familiar with the components of the steering linkage it will be explained.

The front axle is fixed and each end is formed into a fork like construction, the tips of the forks being provided with vertical holes. That part of the knuckle that carries the wheel has an abutment or pivot member which has a similar vertical hole. A pin is passed through the openings of the fork member and knuckle and so secured that it does not rotate. The knuckle being pivotally mounted permits the wheels to be deflected through a relatively wide angle.

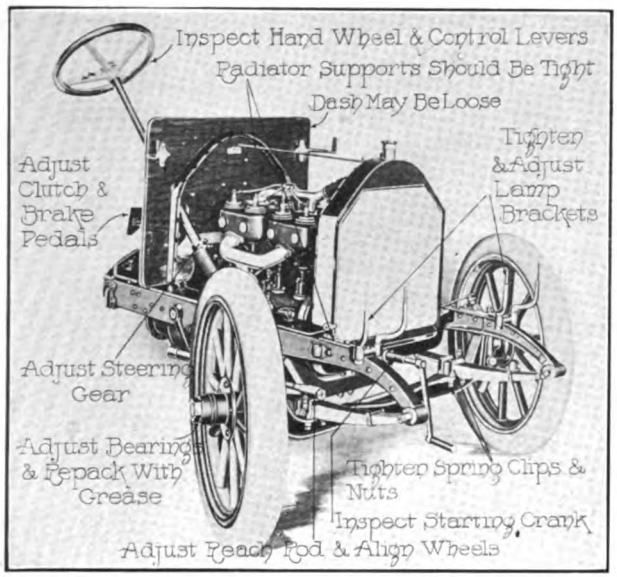
Each pivot member is provided with an integral arm and these are connected by means of a horizontal tierod. A second arm is integral with the pivot member and is connected with the steering gear arm by another rod. When the steering wheel is rotated, the arm member moves forward and back, imparting motion to the rod member, thence to the knuckles, and the road wheels are deflected in a corresponding direction by means of the tierod.



These components are subject to wear and considerable shock. All joints and connections of the linkage should be inspected carefully and any lost motion should be eliminated as far as possible. Adjustable joints are largely employed in the linkages of modern cars and are usually of the ball type. The end of one of the parts is spherical, this being retained in the cup shaped member of the other.

The wheels should be jacked up and the components tested for undue play. If any exists it should be corrected. Bushings are usually fitted to the pivot member and if badly worn new ones should be procured, as well as a new pin. If the ball and socket connections are not adjustable the repair will require the services of the expert or the machinist.

The adjusting of the steering gear worm wheel and sector will depend upon the design, but provision usually is made for taking up the thrust and lost motion. In making adjustments it should be borne in mind that the parts must not work stiffly as the steering will be affected. It is advisable to remove the pivot pins to make sure the holes carrying the lubricant are not clogged.

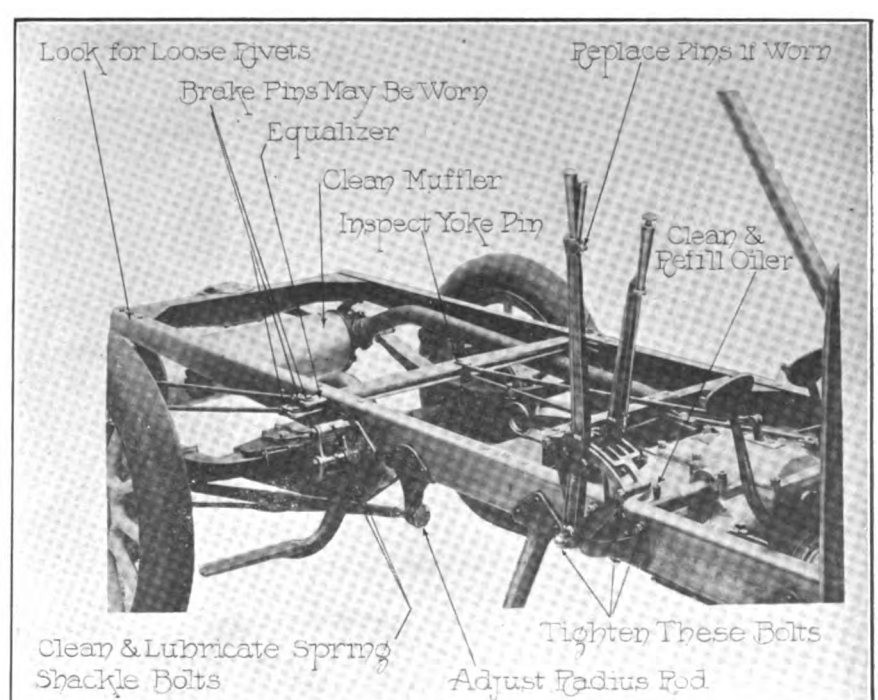


Inspection of Brakes.

The inspection of the brakes is vitally important. Remove all grease from the linings and if the latter be worn badly new material must be fitted. If the surface is worn flush with the heads of the rivets, considerable more service may be obtained by flattening the rivets, provided they are not too deeply countersunk. After adjusting the brakes, test them thoroughly, especially if equalizers are not provided. This may be accomplished by jacking up the rear axle and setting the brake a notch at a time, trying each wheel.

When an Anti-Freezing Solution Is Employed It Is Important That All Joints Be Tight to Prevent Loss of Fluid.

Digitized by Google

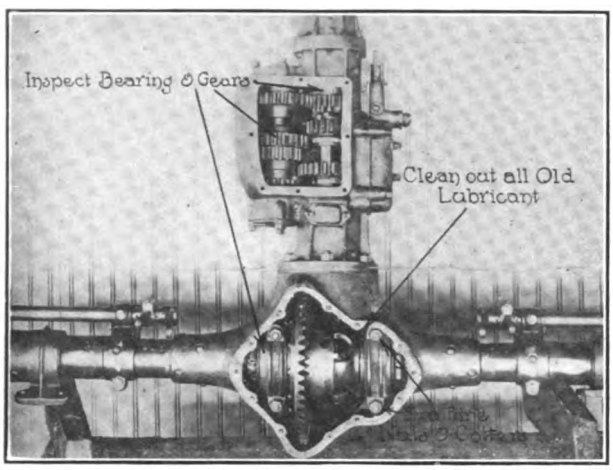


Lost Motion in the Steering Mechanism and Linkage Is Dangerous and Components Should Be Inspected, Adjusted and Lubricated.

As with the rest of the car, the overhaul of the power plant will depend upon its condition. If the machine has been driven considerably it may be possible that the main connecting rod and camshaft bearings will require adjustment and that upon examination one or more of these may permit of being taken up slightly. In performing this work it will be necessary to remove the lower section of the crankcase, although some motors have liberal sized inspection plates by means of which the work may be accomplished easily without dismounting. Taking off one or more shims may compensate for the wear, and the bearing should be tightened and tested according to the design and instructions of the maker.

Removing the carbon deposits is a simple matter with some types of motors, while with others it will require displacing the cylinders. When the overhaul is to be thorough the carbon may be removed and the valves ground in at the same time. When the combustion chamber is fairly accessible, scrapers may be utilized, saving the trouble of taking down the cylinders. All deposits of old oil and grease, as well as dirt, should be removed from the power plant and the work of cleaning extended to the pan or shield.

Valve Timing and Adjustment.



After replacing the valves, springs, etc., the timing should be checked up to insure that the motor delivers its maximum efficiency. Usually the flywheel is marked with letters and figures, these indicating the proper opening and closing of the intake and exhaust valves. Affixed to the rear cylinder, or on the dash, is an arrow or pointer with which the marks on the periphery of the flywheel should register. The letters usually employed are I O, I C, E O and E C, indicating the point at which the intake or exhaust opens or closes. To check the timing, crank the motor or rotate the flywheel by hand, which will be an easy matter with the spark plugs removed, until the marks I O, 1 register with the arrow, making sure that the first cylinder is intaking. This will be noted by moving the wheel a trifle past the mark, when the intake valve will be lifting. If the latter begins to open when the arrow and marks coincide, it may be assumed that the timing is fairly accurate, providing the motor is not worn badly. Each valve should be tested similarly, and if the opening be late it may be corrected by loosening the check nut of the tappet and lengthening that member until the proper

Illustrating Some of the Components of the Chassis Requiring Attention.

Digitized by Google

opening is secured. If each valve is treated in this manner it will be surprising how smoothly the motor will run. In tightening the check nuts

Dirt and Small Pieces of Metal May Accumulate in the Transmission or Differential Forming an Abrasive.

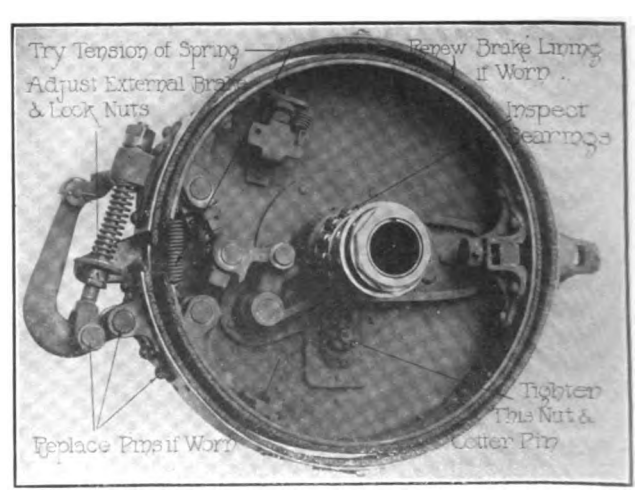
care should be exercised in handling the wrench so as not to exert undue or uneven stresses upon the tappets, etc.

Cleaning the Lubricating System.

The components of the lubricating system require consideration as oil flows less freely in the winter, and with some systems its passage is very slow until the motor has become warm. Many types will require no more than a general cleaning or flushing out with kerosene, while those on the compression principle and utilizing the exhaust, will need a thorough inspection.

If considerable oil has been fed to the motor it is probable that the check valves have become caked with carbon and these members should be disassembled, carefully cleaned and replaced. Go over all connections, making sure that each is tight. One of the most common sources of trouble is the check valve leading to the reservoir. In replacing this member use a drop or two of oil. The proper grade of oil to employ during cold weather is suggested by the makers of all lubricants.

Cooling Systems.



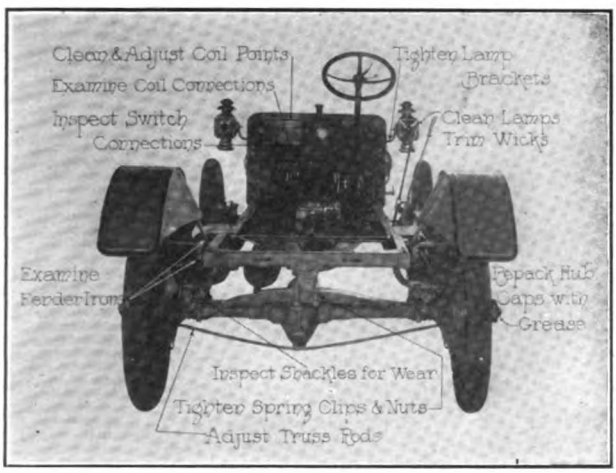
The various anti-freezing solutions and method of preparing the circulation system were fully discussed in the Oct. 25 issue of The Automobile Journal. The information may be supplemented, however, with the suggestion that a hydrometer be procured, the utilization of which will enable the operator to ascertain easily the freezing point of the fluid. It is to be assumed that the radiator is in good condition and that any leaks in the circulation system have been remedied before the anti-freezing solution is employed.

Cleaning the Fuel System.

The fuel system should receive careful consideration in cold weather and the carburetor, tubing and tank require cleaning to remove all deposits and water. Fortunately provision is made upon the majority of cars for trapping water, this being released easily by opening a petcock or removing a drain plug. Those with cars not thus equipped will do well to empty the fuel tank and make sure that water has not settled in the bottom of the container. The writer knows of an instance where water collected and froze, preventing operation of the machine until it was towed to the garage, thawed out and the water removed. If the construction of the tank be such that its interior cannot be cleaned easily, it is possible to utilize a piece of chamois on a stick by inserting it in the container. The chamois will pick up all moisture and sediment.

Cleaning Bearings.

In the inspection of the chassis components the wheel, clutch, transmission and differential bearings should not be overlooked. The clutch members may be worn, causing the clutch to drag and may be responsible for the trouble experienced in changing gears, or the facing may need renewal or treatment. With the multiple disc type, the old lubricant is removed and the plates washed thoroughly with kerosene before new is inserted, after which any adjustments needed may be made. The proper grade to employ in



The Brakes and Actuating Mechanism Require Careful Consideration and Worn Linings Should Be Replaced with New.

this member, as well as in the transmission, is given by the maker and some advise the use of a lighter lubricant in cold weather.

Digitized by Google

The transmission may be inspected for wear by washing it out with gasoline or kerosene, a treatment which will remove any particles of

Showing Components of the Rear Axle and Dash Requiring Attention.

metal that may have accumulated and which form an abrasive, creating undue wear of the gears, etc. While the gears are exposed it is an excellent plan to try the various speed changes and note if the shifting members require adjustment.

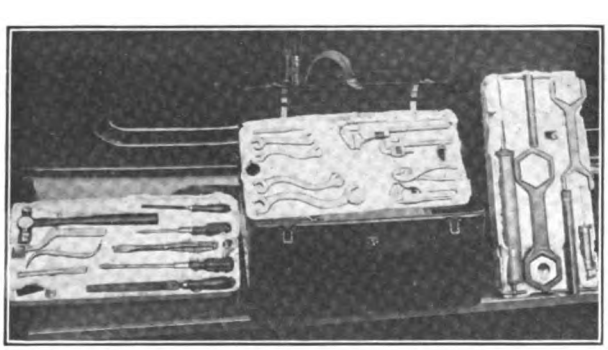
Adjusting Bearings.

If the car has seen considerable service the old lubricant should be removed from the differential, the gears, etc., being washed with gasoline. Afterward the components may be tested for lost motion and if any exist it should be eliminated, as well as any end play in the propeller shaft. The wheel bearings may be tested by jacking up each member and trying for play, and it is a good plan to clean bearings and replace the old lubricant with new. In adjusting ball bearings, the cone is screwed up until snug, then slacked off a half-turn and the parts locked, taking care to replace the cotter pin or key. If difficulty be experienced in eliminating play in front wheel bearings; that is, if they tend to seize during part of the rotation of the wheel, but are loose upon further movement, it will be due to the axle spindle having become sprung.

Springs, Frame, Etc.

In the inspection of the chassis it is well to examine the bolts, rivets, etc., for possible looseness, as well as the clips and fender irons. If the springs have become dry the bearing surfaces of the leaves should be cleaned and graphited, and the work is made easy by jacking up the body and prying the leaves apart. There is a spring tool, made especially for this work and which is not expensive. Before leaving the chassis all grease cups will require cleaning and refilling with fresh lubricant, taking care to remove the surplus, as it attracts dirt.

Tires and Rims.



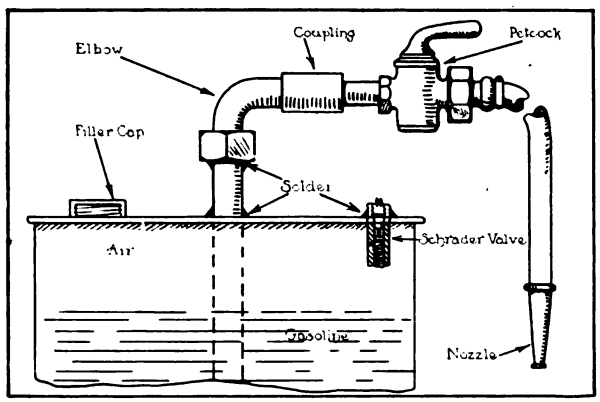
Examine the tires carefully for cuts and if any exist have them vulcanized, as the shoes are subject to considerable moisture in winter due to the snow and ice. Although it is a disagreeable task, the shoes should be removed from the rims, the latter being cleaned and treated to a coat of graphite. Although the use of paint is recommended by some, the writer has attained better results with graphite, which is easily applied, more enduring and keeps out water. Demountable rims should be treated similarly.

The body will not require any special treatment other than the replacing of the fore doors, if these have been removed, and the closing of the ventilating devices. Cars not equipped with doors may be fitted with these members and several concerns make a specialty of producing designs requiring little effort to install. The ingenious motorist may construct fairly neat side curtain members from canvas, which material when painted to match the color of the car is quite satisfactory.

The top may need cleaning or repairing and it is possible that a new window will be necessary in a side curtain or the storm front. Inspect the windshield, and if any of the fastenings be loose, or broken, tighten and replace with new.

Lamps, Generator, Etc.

Coming next to the lighting system, it is advisable to clean thoroughly the oil lamps, as well as the gas members. Nothing detracts so much from the appearance of the car as dirty lamps, a condition due to smoking wicks. The mirrors of the headlights are cleaned easily with tissue pa-



Showing How Tools Are Carried to Prevent Injury as Well as Rattling Noises.

per or with a little warm water and a soft cloth. Inspect all tubing carrying the acetylene and if the exterior be cracked, throw the pipe away and

Digitized by Google

fit new. There is a special gas tubing which is weather proof and which is indexed under the Buyers' Guide. Defective burners should be re-

Home Made Cleaner Operating on the Compressed Air Principle, Which May Be Constructed Easily.

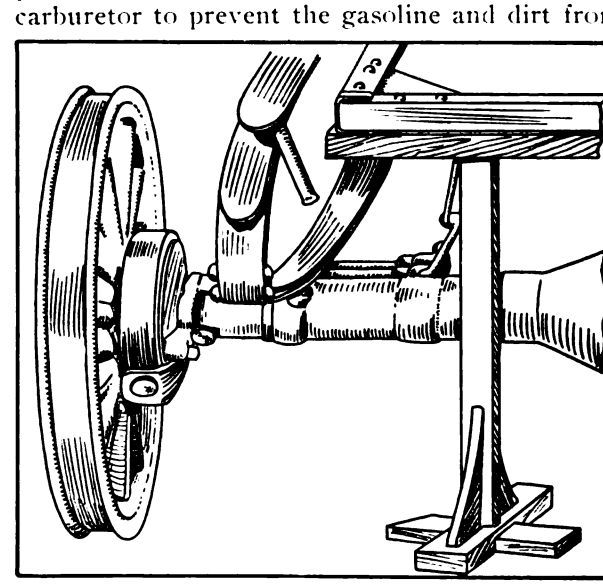
placed with new if the old members cannot be made serviceable by cleaning. When a generator is employed it should be cleaned thoroughly, and if water jacketed the water should be replaced with an anti-freezing solution.

Tire Chains Important.

While there are several designs of non-skid tires the tire chain is generally conceded to be indispensable when the roads are covered with snow or ice. For the benefit of the new motorist who has not utilized these members it should be explained that there is but one proper method of attaching them. The free ends are secured through a snap and hook arrangement and in placing the chain upon the wheel it is important to observe that the closed end of the hook is in the direction in which the wheel travels, as indicated in an accompanying illustration, which also depicts how to fold the chains to make easy their fitting. Chains should be snug and free from undue play, which is detrimental to the shoe and imposes strains upon the rear axle mechanism.

During severe cold weather many make it a practise to remove the fan belt and to partially cover the radiator as shown in an accompanying illustration. If the cover is retained by bolts passing through the fins of the cooler, these should be covered with rubber tubing to prevent chafing of the metal. The fitting of the cover and material utilized will depend upon the design of the radiator.

The selection of suitable clothing, robes, gloves, etc., is optional, depending upon individual requirements. Space does not permit of taking up all the features in detail, but the suggestions made should prove of value.



PUTTING THE CAR AWAY.

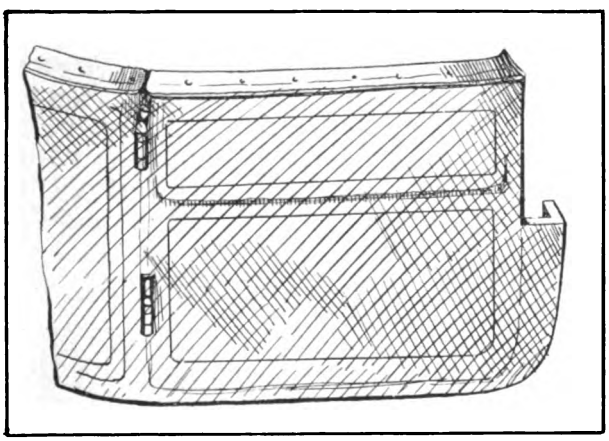
In putting the car away for the winter it should be borne in mind that its condition and appearance will be important factors in the event it is to be sold or traded in the spring. First of all it should be carefully washed and dried, and if the garage be a small one the work had best be performed outside to keep dampness out of the building, as moisture is detrimental to paint and varnish.

The next step is to strip the machine of all accessories, these including lamps, speedometer and cable, horn, gas tank, generator, extra tires, trunks, etc., placing them at one side. The top is next put up and thoroughly cleaned as should be the side curtains and upholstery, removing all grease and dirt stains.

If an overhaul of the chassis is planned during the winter or spring, much valuable time will be saved by removing the body and placing it upon horses or suitable boxes, covering it carefully to keep out dust and moisture. The robes and articles stored under the seats may be removed or taken out when convenient.

The chassis is now ready for cleaning and this work also should be performed out of doors. The grease and dirt may be removed with a brush and gasoline or with the device shown in an accompanying illustration and working on the compressed air principle. Cover the magneto and carburetor to prevent the gasoline and dirt from

Illustrating Method of Jacking Up Frame to Lubricate Springs as Well as to Relieve Latter of Stresses.



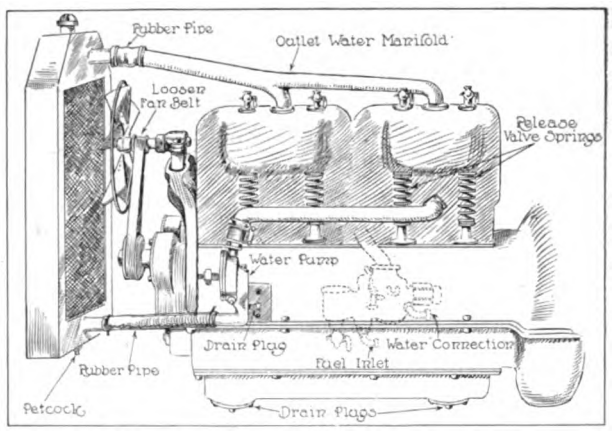
reaching these members. Next clean out the circulating system by using a solution of soda and water, running the motor several minutes before

Digitized by Google

draining out the fluid and flushing with clean water.

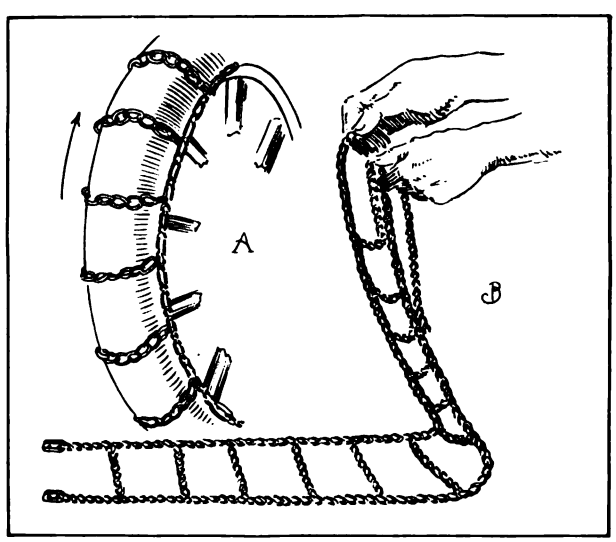
Before rolling the chassis into the garage make sure that all water is removed from the cylinders, radiator, pump and pipes. This is important, especially if the car is to be stored in an unheated building. The old lubricant should be removed from the crankcase, kerosene inserted and the motor cranked vigorously to splash the fluid to all working parts. Cleaning out the transmission and differential will save considerable time when the car is to be placed in commission again.

Next jack up the wheels and remove the tires, cleaning and treating the rims as previously outlined, after which operation the frame should be jacked up to relieve the springs of all weight. Wooden jacks are constructed easily from old pieces of joist. The fuel may be drawn off, taking care to open the filters to remove all water. If the carburetor is water jacketed, disconnect the pipes and remove the vaporizer, emptying out the water. All fluid must be removed from the generator and it is an excellent plan to clean this member thoroughly at the same time.



Fore Doors Contribute to the Comfort of the Operator—Design Made by Lortz & Co., Cleveland, O., for Model T Ford.

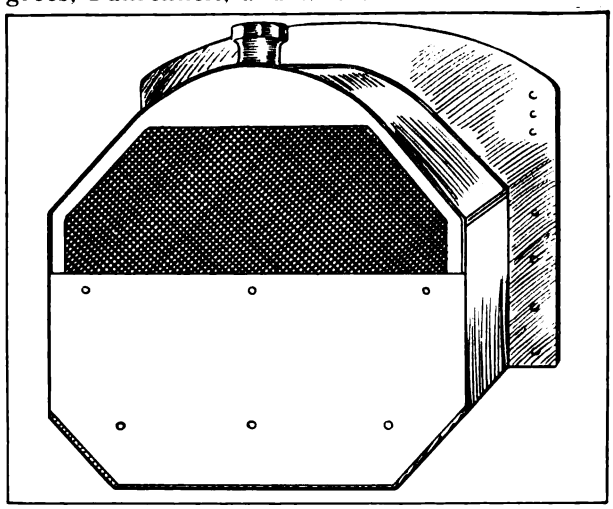
Care of the Motor.



It is poor practise to allow a motor to stand all winter with the tension of the valve springs unrelaxed, as the elasticity is impaired. It is a simple matter to remove the retaining cotter pin or key. Loosen the spark plugs and pour about half a pint of kerosene into each cylinder. During this work a general inspection of the chassis is possible and a memorandum may be made of components requiring attention and new parts needed. This will simplify the overhaul in the spring.

All brass work on the car and accessories should be thoroughly cleaned and covered with polish or grease to prevent tarnishing, and the members stored carefully. Nickel work may be covered with a thin coating of vaseline. In putting away the gas tank make sure that the valve is closed tightly. Before storing the lamps, remove all oil and accumulations of dirt and grease from the metal and glass. If the car is lighted by electricity with current supplied by a dynamo and battery, the novice will do well not to interfere with the generator and its connections. The storage battery, however, should be given attention according to the instructions of the maker.

In Putting the Car Away for the Winter It Is Vitally Important That All Water Be Removed from the Circulating System.



In preparing the tires for storing, one cannot be too careful. They should be washed and thoroughly dried, followed by an inspection for cuts or sand blisters. If any exist the shoe should be sent to the tire expert for renovation. Wrap the casings carefully in dry paper or some other

Tire Chain Hints: A, Proper Method of Attachment; B, How to Fold Chains to Make Easy Their Fitting.

Digitized by Google

protective material and store in a dark room where the temperature is between 45 and 70 degrees, Fahrenheit, and where there is a free circulation of air, if possible. Do not place the tires flat, but arrange them vertically. Tubes require even greater care owing to the higher percentage of gum rubber.

Showing How Lower Portion of Radiator May Be Protected During Severe Cold Weather.

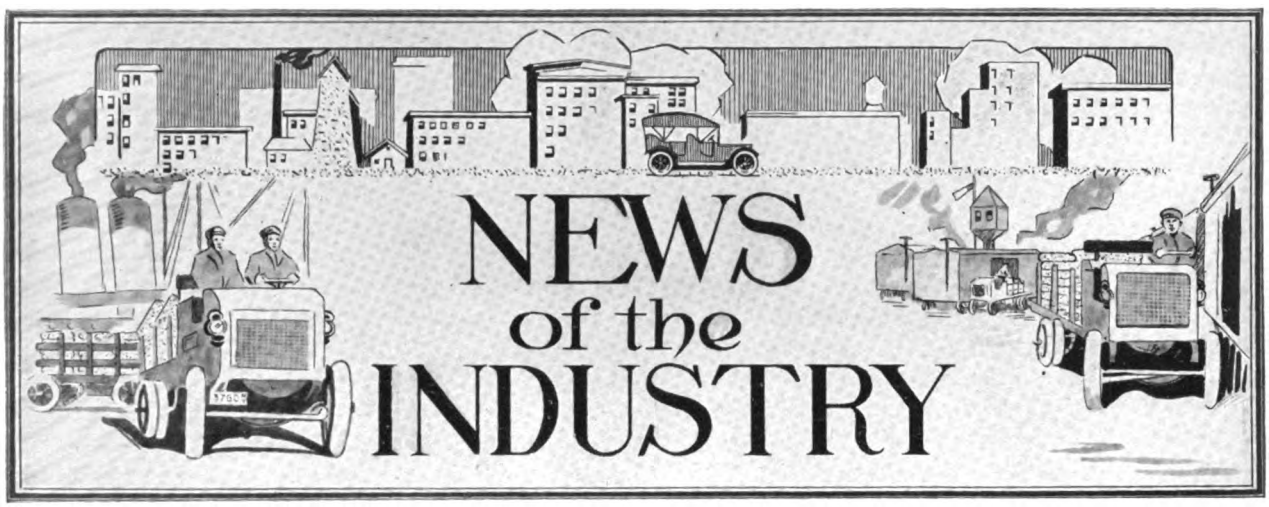
Occasional Use of Car.

Should the service of the machine be desired occasionally during the winter, the water either should be drawn off or an anti-freezing solution employed. Each wheel should be jacked up and the air let out of the tires, leaving just enough for the casing to retain its form. Cover the machine with cloth or similar material and do not expose it to the rays of the sun. If near a window pull down the shade or cover the window with some material that will not admit sunlight.

Driving Hints.

In taking the car out of a cold garage care should be exercised in changing gears and in subjecting the components of the driving mechanism to severe stresses until they have become warmed through operation. If the machine has been exposed to the cold overnight it is an excellent plan to remove the radiator cap or open the petcocks and make sure that the water has not become frozen, as endeavoring to crank the car without inspection may result in a broken pump or stripped gears. If frozen it is best to tow the machine to a warm place and allow it to thaw out gradually. When leaving it for any length of time, cover the radiator with a blanket or robe. In this manner starting will be facilitated, as the water will thus retain its heat for a considerable period, especially if chassis be equipped with a suitable pan or undershield fitting close to cooler.

PRAISES EMPIRE TIRES.



The Empire Tire Company, Trenton, N. J., is in receipt of a letter from B. O. Gilden, president of the America Sanitary Works, New York City, in which a high tribute is paid to the quality of the Empire tires. Mr. Gilden says: "It may be of interest for you to know that we have returned from our successful transcontinental trip, having covered over 27,000 actual running miles in a 58 horsepower touring car carrying nearly a ton of baggage and freight in addition to the ordinary equipment, bringing the total weight up to 6800 pounds. Empire tires, 37x5.5, were used exclusively on the trip and we cannot say too much for the goods you produce, as the trip speaks for itself.

"We drove into New York City on a shoe placed on the car at Los Angeles, Cal., going from there through the mountains to San Francisco, touring the Hawaiian Islands and returning by way of British Columbia, covering more than 10,000 miles with no blow-outs. We are not interested in tires or automobiles, other than from a commercial standpoint, as we had 'B.O.T.' sanitaries to advertise, hence could not afford to talk automobiles. It being a commercial trip, our judgment would have been severely criticised with poor equipment, therefore, no expense was spared to accomplish the desired result and we are under no obligations to any manufacturer."

Before Storing Tires, Dirt, Grease and Moisture Must Be Removed and the Casing Covered with a Dry, Protective Material.

SCHEBLER RETIRES FROM FIRM.

Sells His Interest in Wheeler & Schebler Because of Continued Ill Health.

Announcement has been made that George M. Schebler, inventor of the Schebler carburetor and member of the firm of Wheeler & Schebler, Indianapolis, Ind., has retired from business on account of ill health. The news will come as a surprise to many, but to Mr. Schebler's friends it had been known for some time that he intended to close out his business interests.

Mr. Schebler was one of the first men in America to devote his time to the construction of a carburetor for gasoline engines. At that time he had a small shop for experimental purposes, which has since grown into the largest plant of its kind in the United States. For the past several years Mr. Schebler's health has been failing and his retirement comes only after the most mandatory advices of his physicians. By the retirement of Mr. Schebler, F. H. Wheeler will become the sole owner of the plant, having purchased Mr. Schebler's interest. He states that the firm name will not be changed.

LENOX IN NEW FACTORY.

Plans Under Way for Still Another Addition to Accommodate Rapidly Growing Business.

The Lenox Motor Car Company, Hyde Park, Mass., maker of Lenox cars, has moved into its new factory, recently completed. The company now has 30,000 square feet of floor space in addition to office rooms. Despite the fact that the company has been operating only three years the demand for Lenox cars has been so great that the first plant at Jamaica Plain was speedily outgrown, necessitating more room.

Even the new plant is not sufficient to carry on the business and plans have been drawn for another new factory building adjoining it, to be four stories high and having 120,000 square feet of floor space. Work will be begun upon this immediately and it is hoped to have it in operation early next year.

UNITED STATES MOTOR SITUATION.

Receivers File Reprt and Reorganization Plan Awaits Further Action by Court.

Robert S. Walker and W. E. S. Strong, receivers of the United States Motor Company, presented their report to Judge Charles M. Hough of the United States district court in New York City, Oct. 28, the document comprising 40 pages of closely written manuscript. The schedule of assets and liabilities is presented in brief, herewith. The receivers recommended that the manufacture of cars by all subsidiary companies, except the Maxwell-Briscoe Motor Company, be abandoned; that the deposits of dealers be returned, and that they be given authority to issue $1,500,000 in receiver's certificates with which to continue the business.

As a means of settling the present action between the Brown & Sharpe Manufacturing Company and the United States Motor Company, a proposition to sell the property was made, this to be determined at an adjourned session of the court Nov. 11. Frederick D. Bond, acting for certain minority stockholders filed a demurrer to the action on the ground that inasmuch as the

Digitized by Google

plaintiff was a Rhode Island concern and the defendant a New Jersey corporation, the equity suit should have been started either in Rhode Island or New Jersey, instead of New York. This may have the effect of delaying a final settlement somewhat.

The plans for reorganizing the United States Motor Company appear to have been held in abeyance until after the adjourned court session of Nov. 11. In the meantime it is stated that W. E. Flanders of the Flanders Manufacturing Company, Detroit, has made an examination of the properties of the company, and that representatives of the United States Motor Company have inspected the Flanders properties with a view to combining the two concerns, although nothing definite has been determined in this respect, it is understood.

As stated previously the receivers' report was very complete. A summary of the schedule is as follows:

AGGREGATE ASSETS.

Real estate, buildings and equipment, estimated value as a going concern	$5,119,356.31
Furniture and fixtures	76,000.00
Inventories, estimated as going concern with all factories operating except Brush	4,500,000.00
Accounts receivable	550,000.00
Notes receivable	34,830.20
Cash in hand and on deposit	412,027.80
Cash, special fund to provide for dealers' deposits	62,513.24
Prepaid expenses, insurance premiums, unexpired portions	45,440.21
Total assets, other than inter-company accounts	$10,800,167.76
Inter-Company Accounts.	
Entire debt so far as unassigned	$1,198,769.54
Notes receivable	2,000.00
National Motors Company	4,042.23
Providence Engineering Works	.....
Total assets, other than securities, going concern value	$12,004,979.53
Securities.	
Briscoe Manufacturing Company	$367,995.00
Providence Engineering Works	1.00
E. R. Thomas Motor Car Company	.....
Courier Car Company	.....
National Motors Company	355,190.07
Total assets, estimated value	$12,728,165.60

AGGREGATE LIABILITIES.

Real estate mortgages	$164,540.90
Debenture bonds, bond scrip and interest	6,161,509.87
*Notes of one or more subsidiary companies, indorsed by the United States Motor Company, and notes of one or more selling branches, similarly indorsed, with interest	2,194,258.12
Notes of United States Motor Company, indorsed by one or more subsidiary companies	650,820.99
Claims against United States Motor Company, of which approximately $100,000 is due for goods delivered immediately prior to receivership	1,961,875.99
Claim against Columbia Motor Car Company, or United States Motor Company, or both	91,789.60
Notes secured by sight draft on car shipments	63,691.26
Wages of employees and accrued expenses	74,256.30
Dealers' deposits, partly offset by accounts receivable	55,113.24
†Contingent liability on indorsement of notes of E. R. Thomas Motor Car Company	400,000.00
Providence Engineering Works, claim made for work performed (disputed) $138,532.26	.....
Total liabilities, other than inter-company	$11,817,856.27
Inter-Company Accounts.	
Briscoe Manufacturing Company	$313,970.91
The capital stock of this company is owned entirely by the United States Motor Company and as it is regarded as solvent, this liability is taken at	.....
Total liabilities	$11,817,856.27
Excess assets, estimated value as shown, over liabilities as shown	910,309.33
Total	$12,728,165.60

CAPITAL STOCK.

Outstanding, outside ownership, not included in this statement:	
United States Motor Company, preferred	$11,499,733.33
United States Motor Company, common	12,206,350.00
Columbia Motor Car Company, preferred	13,400.00
Columbia Motor Car Company, common	118,000.00
Total	$23,837,483.33

*It is estimated that the branch selling houses can pay $756,226.18 on their notes, after providing for local indebtedness.

†The receivers of the E. R. Thomas Motor Car Company estimate that that company will pay from 25 to 40 per cent. to its creditors.

WILL MAKE WALPOLE TIRES.

New Concern Organized to Take Over Business Formerly Conducted by Maine Corporation.

The Walpole Tire & Rubber Company has been incorporated under the laws of Massachusetts to acquire the good will, rights, property and assets of Walpole Rubber Company, a Maine corporation. The capital of the new company is $4,500,000, of which $3,000,000 is 7 per cent. cumulative preferred stock and $1,500,000 common. The company will manufacture tires and all kinds of rubber goods, with factory at Walpole, Mass.

The preferred stock of the concern has no voting power and is retirable at the option of the directors at $120 a share and accrued dividends after five years from date of issue, in lots of $50,000 at a time. The incorporators of the corporation are: E. W. Tinkham, Harrisville, R. I.; A. T. Baldwin, Boston; F. J. Gleason, Walpole; E. C. Green, Boston; E. W. Furbush, Roxbury, Mass.; L. O. Dulcos, West Roxbury, Mass.; J. C. Blanchard, Jr., Boston.

OPENS VIRGINIA PLANT.

Kline Motor Car Corporation Transfers Bulk of Its Business from York, Penn.

The new factory of the Kline Motor Car Corporation on a 15-acre tract in Richmond, Va., has been opened, and for the past month machinery and other factory equipment has been shipped from the old plant in York, Penn. It is not the intention of the company to abandon the York factory, but this will be maintained as a service station and sales branch.

The new building is shown in an accompanying illustration. It was erected at a cost of more than $100,000 and is fully equipped with all modern manufacturing facilities. About 750 men will be employed at first, but it is expected that the force will be augmented in the near future.

New Factory of the Kline Motor Car Corporation at Rich mond, Va., Covering a Tract of 15 Acres.

The factory is built in two parallel wings, connected at the end by a shorter wing, in front of which and joined to the rest of the plant is the 2.5-story office or administration building. Each of the main wings is 600 feet long and 60 feet wide. They are 1.5 stories in height, the upper portion being covered with a cone shaped roof, on either side of which are adjustable windows, operated from the factory floors by rods, thus affording excellent light and ventilation. The connecting structure between the two main wings is the same height and construction, and is 30 feet wide and 60 feet long. Within the court are the tracks of the Seaboard Air line, over which shipments will be made.

The office building is of the Colonial type of architecture. Each floor is 30 feet wide and 60 feet long. Extending out from the eaves of the roof and supported by four white stone columns is a port cochere, covering a driveway which leads to the main entrance of the general offices. The officers of the corporation, the general manager and the purchasing agent will be located on the first floor, while the sales manager, advertising manager, engineer and other department heads will be on the second.

JOINS REMY ELECTRIC COMPANY.

Well Known Authority on Starting and Ignition Apparatus Becomes Consulting Engineer.

O. F. Conklin, for 16 years chief engineer of the Robbing & Myers Company, Springfield, O., and a well known authority on electric starting ignition systems, has become consulting engineer of the Remy Electric Company, Anderson, Ind., maker of Remy magnetos. It is understood that he will have charge of the design and construction of the new Remy electric starting device for application to automobile engines.

The Remy company also announces the appointment of P. E. Kempton of San Francisco as manager of the San Francisco Remy branch to succeed A. J. Rogers, who becomes manager of the New York branch in place of F. M. Henkel, resigned. W. F. Hamilton, formerly assistant manager of the Indianapolis branch, becomes assistant manager of the San Francisco branch and is succeeded at Indianapolis by A. H. Berndt, who has been connected with the sales department of the company for several months.

The concern is particularly busy, several large

Digitized by Google

orders for 1913 equipment having been received for early delivery. One of these calls for a car load of Remy magnetos a week for the Willys-Overland Company, Toledo, O., maker of Overland cars.

PEVEAR TO HAVE OWN AGENCY.

Well Known Advertising Man to Head New Concern Established in Rochester, N. Y.

Few men have enjoyed more success in the merchandising field than T. F. Pevear, who has just purchased the magazine business of the Myers Advertising Agency in Rochester, N. Y. Mr. Pevear is a young man well known in the automobile industry, and his many friends will be pleased to learn that he is to conduct his own agency in the future under the name of Pevear & Co.

T. F. Pevear, a Successful Advertising Man.

In 1905 he made his first appearance in the advertising field as an independent copy writer in Providence, R. I. In 1907 he took charge of the advertising department of the Shepard Company in that city and left Providence in 1909 to accept a similar position with the McCurdy & Norwell Company in Rochester. This department store experience proved particularly valuable to him when he decided to enter the agency field. In 1910 he joined the Myers agency, and his energy and keen insight into the various phases of advertising won him the promotion to become secretary the following year.

With his purchase of the old concern comes the announcement that he will devote his personal attention to the handling of campaigns involving wide publicity. A new suite of offices has been opened in the Cutler building, and associated with Mr. Pevear will be: Ralph H. Fulner, in charge of orders and estimates; Carl Raschen, art department, and F. A. Partenheimer, copy department.

ST. LOUIS TIRE FIRM.

New Concern Organized to Produce Equipment for Both Pleasure and Commercial Cars.

The St. Louis Tire & Rubber Company, with capital of $150,000, has been organized in St. Louis, Mo., for the production of tires for both pleasure and commercial vehicles. J. A. Swinehart, formerly associated with the Swinehart Tire & Rubber Company, Akron, O., has been active in the formation of the company, and this fact led to the original assumption that the Swinehart company was interested in the move. It is stated, however, that he has severed his connection with the Swinehart company and that the two concerns will have absolutely separate identity.

Among the St. Louis men associated with Mr. Swinehart are the following:

Nelson W. McLeod, Alfred C. Einstein, Morris Eisenstadt, Roy F. Britton, H. L. Parker, William H. Glasgow, C. C. Collins, William T. Jones, Eugene B. Stinde, Charles M. Skinner, H. C. Barker, H. L. Philo.

ENGINEERS NOMINATE OFFICERS.

Howard Marmon Selected to Head National Society with Able List of Assistants.

Howard Marmon of Nordyke & Marmon Company, Indianapolis, Ind., maker of Marmon cars, has been nominated for the office of president of the Society of Automobile Engineers by the nominating committee. The officers of the society are elected by mail vote, the result of which will be announced at the annual meeting of the organization, which will take place in New York City in January. The nominees for the other offices follow:

Vice presidents, Russel Huff, Packard Motor Car Company, Detroit, and John C. Perrin, Lozier Motor Car Company, Detroit; treasurer, Herman F. Cuntz, Automobile Board of Trade, New York City; members of council, Eugene F. Russell, Locomobile Company of America, Bridgeport, Conn.; Harold L. Pope, Pope Manufacturing Company, Hartford, Conn., and Joseph A. Anglada. Coker F. Clarkson will remain secretary and general manager of the society. Mr. Marmon will succeed H. W. Alden of the Timken-Detroit Axle Company, Detroit, who, as vice president, succeeded to the higher office on the

Digitized by Google

death of H. F. Donaldson in August. The constitution of the society does not permit of re-election to the presidency.

In addition to President Alden the officers who will retire are: Harold L. Pope, vice president; Herman F. Cuntz, treasurer; Henry May, Howard Marmon and Charles Ethan Davis, members of the council. The council members who hold over are: Charles B. Whittlesey, Hartford, Conn.; Arthur B. Cumner, Philadelphia, Penn.; Andrew L. Riker, Bridgeport, Conn.; Herman F. Cuntz, New York City; Howard E. Coffin, Detroit, Mich.; Henry Souther, Hartford, Conn.

FALL CONVENTION PROGRAMME.

Many Interesting Papers Prepared for Meeting of National Association.

The National Association of Automobile Manufacturers, Inc., which passed the century mark in the matter of membership at its October meeting, will hold its fall convention at Detroit, Nov. 13-15. The arrangements are in the hands of a committee consisting of R. D. Chapin, S. D. Waldon, W. C. Leland, Hugh Chalmers and W. E. Metzger, with H. W. Ford as secretary.

The headquarters of the convention will be at the Hotel Pontchartrain. The proceedings will open with a meeting of the executive committee on the afternoon of the 13th. The first session of the general committee will be held the morning of the 14th. There will be another session in the afternoon and in the evening the members will be the guests of the Detroit manufacturers at a banquet. There will be two business sessions the 15th, the next day being left open for visits to factories and other points of interest.

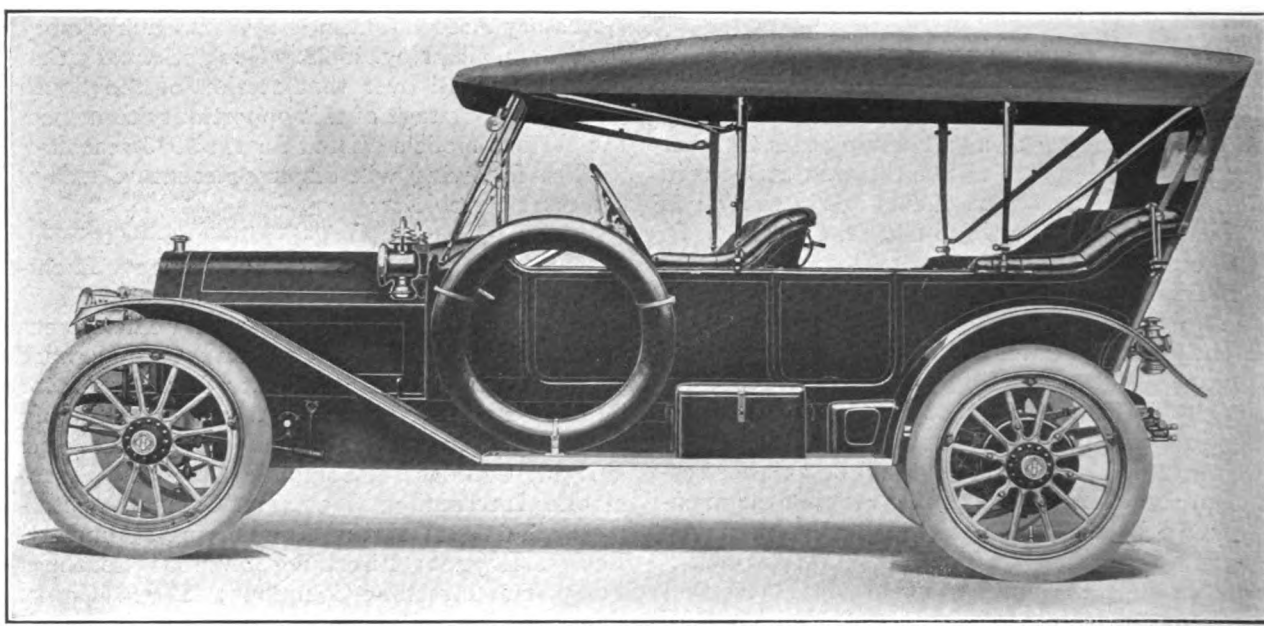
During the various sessions papers will be read and discussed on a number of topics of interest, including the following: "Yearly Models," C. C. Hanch, Nordyke & Marmon Company; "Some Selling Problems," Hugh Chalmers, Chalmers Motor Company; "Multiplicity of Models," G. W. Bennett, Willys-Overland Company; "The National Association of Automobile Manufacturers—What it Has Accomplished and What Can Be Acomplished," S. A. Miles, general manager; "The Commercial Car," S. D. Waldon, Packard Motor Car Company; "Relation of the Volume of Motor Carriage Business to the Volume of Commercial Car Business," David Beecroft, Chicago; "Injudicious Methods of Selling Commercial Vehicles," M. L. Pulcher, Federal Motor Truck Company; "Traffic," J. S. Marvin, traffic manager of the association; "Why All Manufacturers Should Use the Standard Warranty," Walter C. White, the White Company; "Territory and Discounts," E. R. Benson, Studebaker Corporation; "Good Roads," R. D. Chapin, Hudson Motor Car Company; "Labor Conditions," H. M. Leland, Cadillac Motor Car Company.

ATLANTA'S FORTHCOMING SHOW.

Southern Motorists Will Have Ample Opportunity to Inspect the 1913 Models.

Arrangements have been completed for the second annual show of the Atlanta Automobile & Accessory Association in the Auditorium armory in Atlanta, Ga., Nov. 16-23. It is anticipated that people from all over that section of the South will take advantage of this opportunity to inspect the various models offered for the 1913 season.

The following will display pleasure cars and commercial vehicles:



R-C-H Corporation, R-C-H, Hupp-Yeats electric; Michigan Georgia Motor Company, Michigan; Studebaker Corporation, Studebaker; J. I. Case Company, Case; Velie Motor Vehicle Company, Velie; Cole Motor Company, Cole pleasure cars, Federal and Alco trucks; Premier Motor Sales Company, Premier; Fulton Auto Supply Company, Hudson, Marmon; Dteinhauser & Wright, Cadillac; Locomobile Company, Locomobile; International Harvester Company, International trucks; Sigma Engineering Company, Lozier, Haynes; Firestone-Columbus Southern Company, Firestone-Columbus; L. S. Crane, Pope-Hartford; Atlanta Auto Sales Company, Henderson, National, Flanders, Colonial electric; Overland Southern Motor Car Company, Overland, Garford; F. B. Stearns Company, Stearns; John M. Smith, Pierce-Arrow, Chalmers; Oakland Motor Company, Oakland; Mitchell Lewis Motor Company, Mitchell; Ford Motor Company, Ford.

Other exhibitors will be: Reed Oil Company, Reed oils; H. W. Brown, accessories; Chas. E. Miller, accessories and supplies; R. J. Slear, Vesta electric supplies; Elyea-Austell Company, accessories and supplies; Alexander Sewald, accessories and supplies; Atlanta Top and Trimming Company, tops and upholstery; Johnson-Gewinner Company, accessories, supplies, motor apparel and novelties; the Gewinner Company, accessories and supplies.

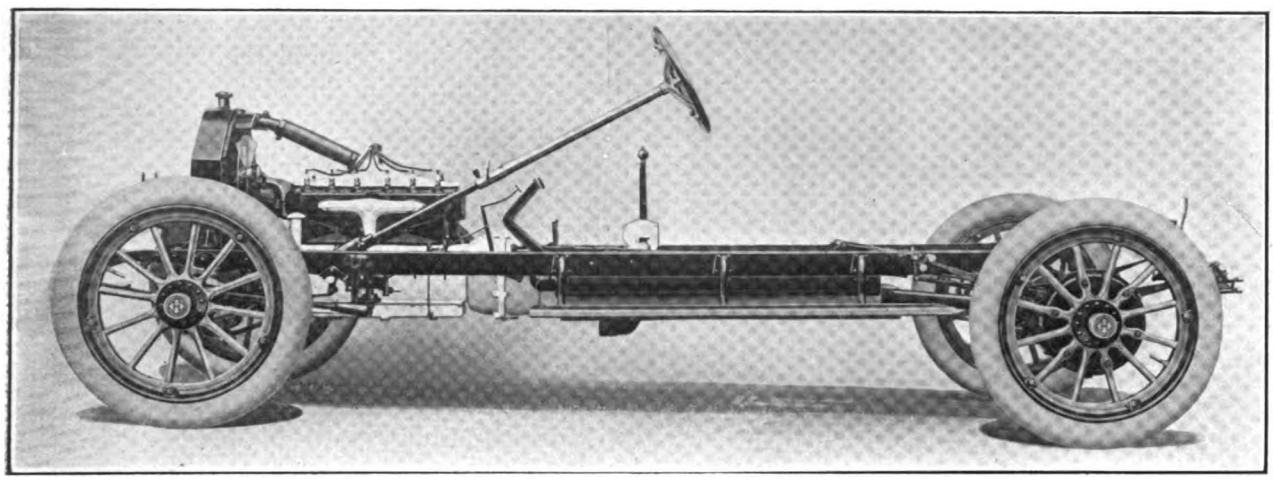
HERRESHOFF ANNOUNCES SIX-CYLINDER MODEL.

ANNOUNCEMENT is made by the Herreshoff Motor Company, Detroit, of a popular priced six-cylinder chassis to which will be fitted two types of bodies, a five-passenger touring and a two-passenger roadster. The new model is distinctive in appearance and will appeal to the discriminating motorist, as its construction is in every way substantial, there being a large factor of safety in each detail and all of the wearing parts are of unusually large proportions, making for durability and minimum cost of maintenance. The design is in accordance with principles well established and indorsed by sound engineering practise, and the policy of the company to employ high grade material and workmanship has been continued.

The Herreshoff Six-Cylinder, 36 Horsepower, Five-Passenger Touring Car, Having a Complete Equipment, Including Electric Lighting System and Electric Motor Starter.



Adequate adjustment for wear and accessibility for inspection and work, are among the qualities of the new Herreshoff Six-36. The equipment is unusually complete, including an electric lighting system and a motor starter. Other prominent characteristics of the chassis are a four-speed gearset, left hand drive and centre control, three point suspension, 124-inch wheelbase and full platform springs. The horsepower production is 36, ample for all requirements, and the machine has sufficient speed and accommodation to meet the approval of those who desire a serviceable and practical car, easily maintained at a minimum of expense.

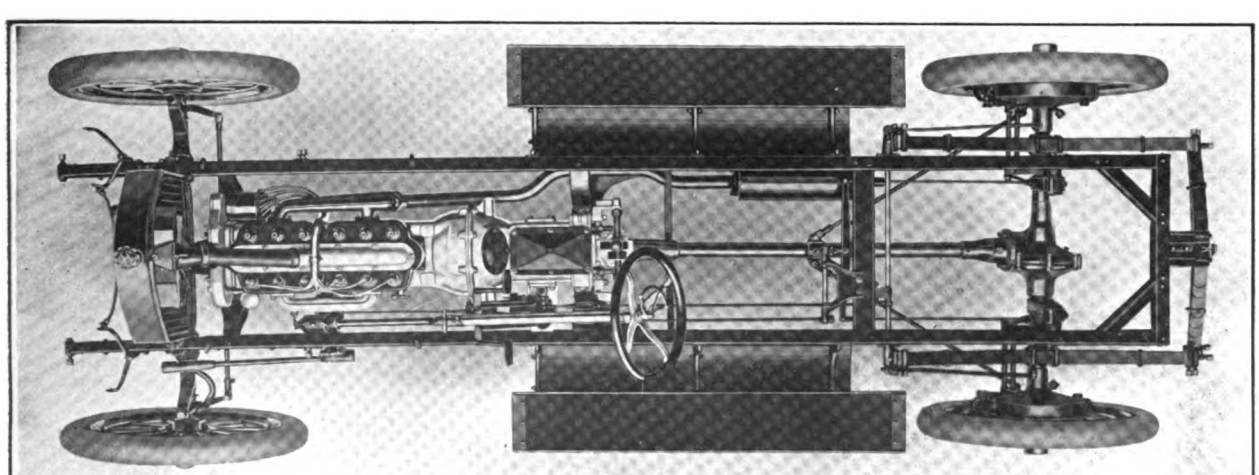
The motor is a highly perfected unit of six cylinders, these being of the T head type, cast en bloc, and the material employed is a special gray iron. The block is formed with the head open so that there is full access to the water spaces, which are unusually large and free from obstructions. The water jackets are cast integral and may be thoroughly cleaned, being readily accessible.

The engine block is bored, machined, then aged and later reamed and ground, a process minimizing the possibility of damage from internal stresses. The inlet valves are at the left and the exhaust are placed at the right, the design and construction of the pockets being such that these members are readily accessible for inspection and cleaning. The bore is 3.375 inches and the stroke 4.5 inches, a bore to stroke ratio of 1:1.33, which places the motor in the long stroke class. The horsepower rating by the S. A. E. formula is 28, but the engine will develop 40 at its maximum, 2350 revolutions a minute, so that the rating of 36 is held to be conservative. Its piston displacement is 241.5 cubic inches.

The pistons are of a special gray iron, 3.25 inches long, turned to size, aged and carefully

Digitized by Google

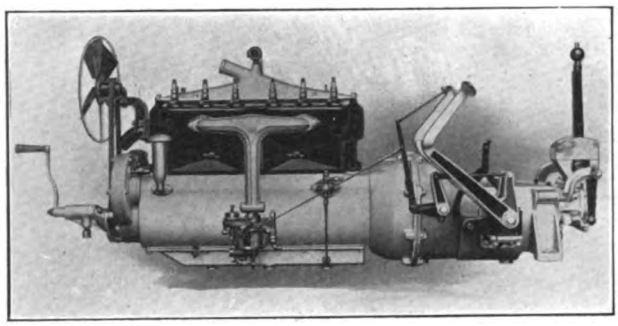
Left Side View of Herreshoff Chassis Showing Low Centre of Gravity, Straight Line Drive and Centre Control.



ground. These are channelled for three rings of the eccentric type, which are ground to exact fit on the edges and the outer periphery. Proper lubrication is assured by means of an oil groove at the wristpin centre. The connecting rod material is a fine alloy steel, heat treated and drop forged, and the wristpin is a special seamless steel tubing, ground to size, .75 inch in diameter, and its bearing is 1.625 inches. The wristpins are securely retained in the piston, oscillate in the connecting rod and there is no possibility of their becoming loose.

Liberal Sized Bearings.

The connecting rods are of a special alloy, heat treated steel, having lower bearings 1.6875 inches diameter and 2.125 inches long, and retained by lugs cast integral. The crankshaft is a one-piece forging of a high grade steel, of large proportions, its diameter being 1.6875 inches. It is accurately ground to size and is mounted on three large bearings, these being 2.5, three, 3.5 inches, front, centre and rear respectively.



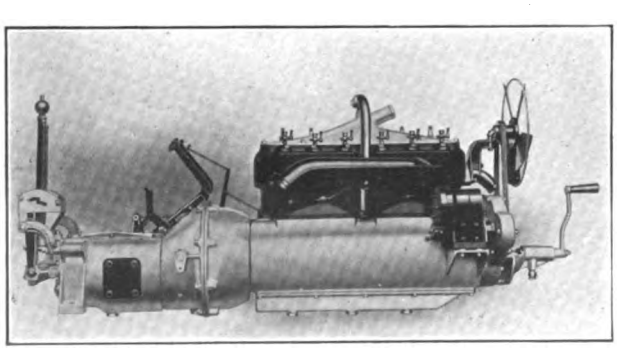
The camshafts, one on either side, due to the T head construction, are made of a one-piece drop forging of carbon steel with the cams integral. The camshafts are .875 inch in diameter, heat treated and ground accurately to size. Three large bearings are provided for each, a design insuring rigidity as well as durability. Bearings are plain and of Herreshoff white material.

The intake and exhaust valves have a port diameter of 1.375 inches, the heads being nickel steel with carbon steel stems electrically welded. The clearance is liberal, insuring a full charge of fuel being drawn into the cylinders and complete clearing of the products of combustion. The valve guides are integral with the cylinders. The tappets are of tool steel, accurately machined and

Top View of the Herreshoff Six-Cylinder Chassis, Showing Three Point Suspension, Unit Power Plant and Accessibility of Sturdy Components.

Digitized by Google

Intake Side of Herreshoff Six-Cylinder Power Plant, Showing Method of Enclosed Valves, Location of Oil Pump and Simplicity of Design.

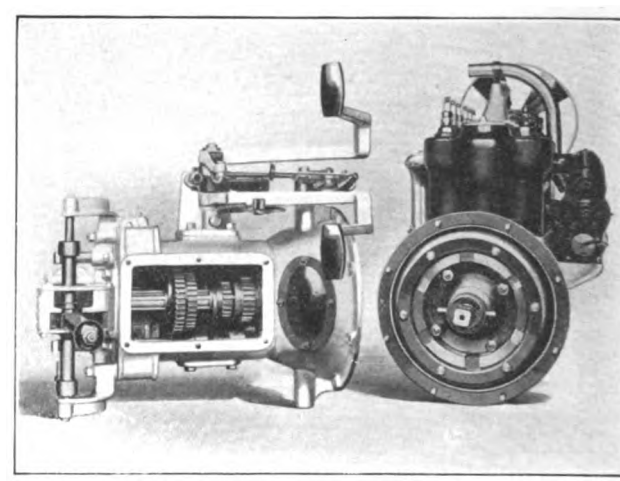


ground, and operate in cast iron guides. Provision is made for adjustment, insuring maximum efficiency from the motor. The valve stems, springs, tappets and the guides are enclosed in pockets formed by webs extending from the cylinder block and by plates that may be clamped in place instantly. This protects these moving parts from accumulations of abrasive substances and much prolongs the life of the mechanism.

Patented Crankcase Construction.

The crankcase is a one-piece aluminum construction embodying the Herreshoff patent and is made to extend back to the clutch, flywheel and gearset in accordance with the unit power plant design and the three point suspension feature. The aluminum case is secured at either side at front to the cross frame member and is supported at one point at its rear on a second cross member.

The timing gears are of large diameter, of the spur type and have a .75 inch face, insuring noiseless operation. The crankshaft and generator shaft gears are of carbon steel with camshaft members of cast iron. All operate in a bath of lubricant and are readily accessible through an aluminum cover.

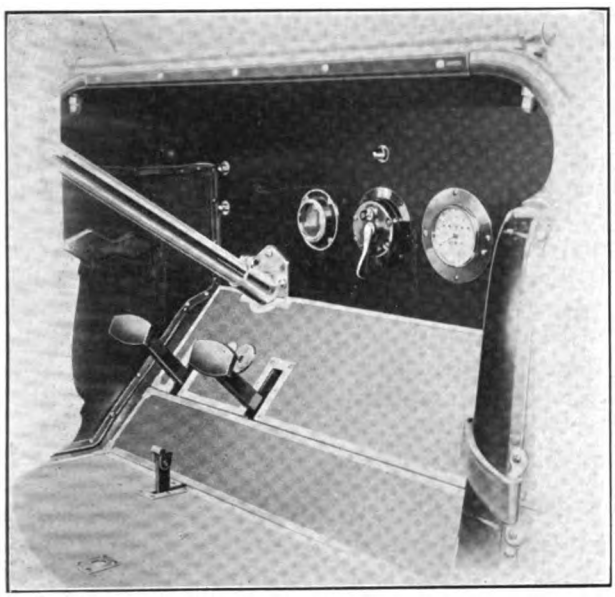


The power plant is cooled by the thermo-syphon system, the water circulating through the large water spaces, entering the motor block at the base of the water chamber by a liberal sized inlet manifold at the left of motor, rising and passing out through an L shaped manifold of equally large area, thence to the radiator. The motor block head is covered with a large cast plate with which the outlet is integral, the plate being secured to the block by cap screws. The radiator is of the vertical tube type, having a capacity of three gallons, and radiation is supplemented by a large belt driven fan of pressed steel. The fan is suspended by a bracket, the fan shaft being in a bearing that is adjustable by an eccentric to secure sufficient belt tension.

Exhaust Side of Herreshoff Motor, Demonstrating the Three Point Suspension and Compactness of Clutch and Gearset Housing.

Lubrication.

The motor is lubricated by oil drawn from the oil reservoir, which is secured to the lower part of the crankcase proper, by a plunger pump actuated by an eccentric on the camshaft, to a sight feed on the dash. Thence the lubricant returns to the crankcase by gravity, the case being provided with wells or pits into which the connecting rods dip, splashing the lubricant to all working parts. As the oil accumulates in the pits, it drains to the reservoir after a constant level has been reached, where it is filtered through wire screen and again pumped through the system. The capacity of the oil reservoir is three quarts. A petcock is provided for noting the correct level of the lubricant and liberal sized drain plugs permit of removing the old lubricant when desired.



Illustrating the Assembly of the Four-Speed Transmission and Multiple Disc Clutch Built in the Flywheel.

Carburetion.

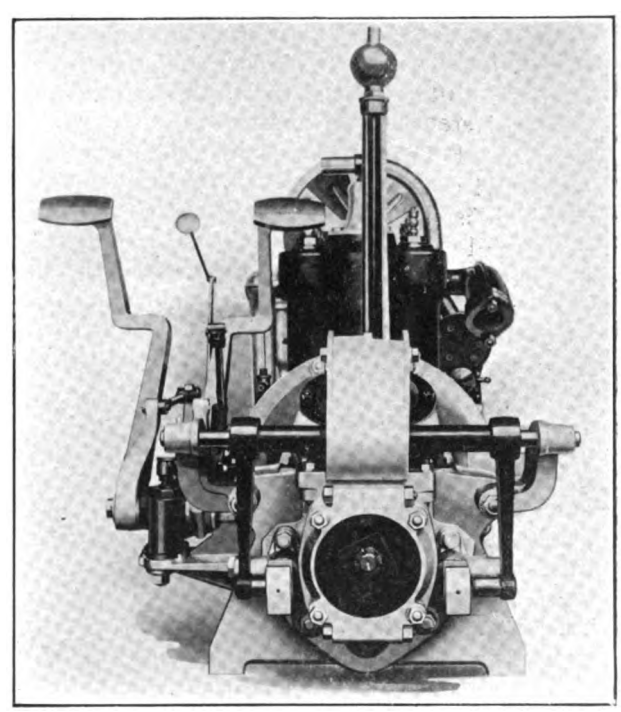
Carburetion is claimed to be a special quality with this motor, through a number of conditions entering into the design. The inlet manifold is of aluminum, T shaped, and its interior is free

Digitized by Google

The Dash Is of Walnut and the Accessories Are Neatly Mounted.

from corrugations which tend to deflect the mixture and cause condensation of the gas. The carburetor is of the float feed type, a model B Stromberg, and is located on the left side of the motor. It is fitted with a device making easy the starting of the engine in cold weather. The fuel is fed by gravity from a 16-gallon tank located under the front seat. The exhaust manifold is on the right, is L shaped and its liberal size reduces back pressure to a minimum. The design of the muffler is such that noiseless operation of the car is assured.

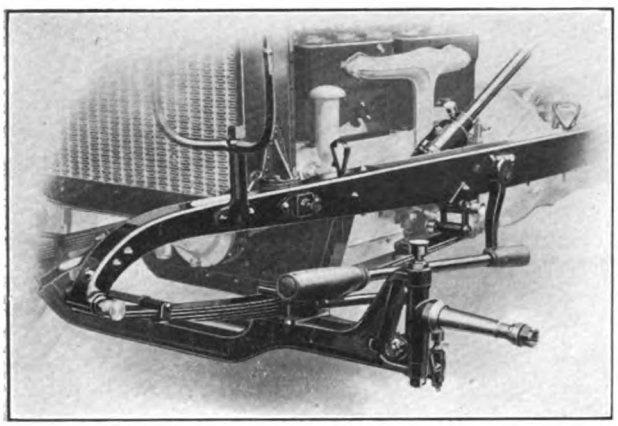
Automatic Control of Spark.



The Herreshoff Motor Company, in keeping with its progressive policy, has equipped the new model with an electric lighting system produced by the Westinghouse Electric & Manufacturing Company. A quality of the generator is that it supplies the power plant with current for ignition purposes as well as for lighting, and that the spark is automatically advanced, having a range of 32 degrees. This eliminates the control lever usually placed upon the steering wheel, simplifies operation and prevents improper advance of the time of ignition, thereby preventing opportunity of motor stresses.

Reserve current is provided by a storage battery of ample ampere-hour capacity, which also furnishes current to the lamps when the car is inoperative. The generator is very compact, located on the right of the motor and is gear driven. One set of spark plugs is provided, located over the intake valves, and the exhaust caps are equipped with priming cocks of improved pattern. Attention has been paid to the carrying of the high-tension cables, these being enclosed in tubing secured to the water outlet manifold.

Four-Speed Transmission.



The clutch is a multiple disc, located in the flywheel, having 24 saw blade plates or discs, these operating in a bath of lubricant, and engagement is accomplished through four springs placed uniformly around the periphery of the clutch. It is readily accessible and its operation very easy. A selective type of transmission is employed and is integral with the clutch unit. Four forward speeds are provided, with direct drive on the fourth, and control is by a ball rocking lever operating through an H quadrant, located at the rear centre of the unit.

The shafts and gears are of a high grade nickel steel, the gears being .75 inch wide. The shafts rotate in imported annular and white metal bearings, the former being fitted to the main shaft, which is of ample proportions. A commendable quality of the Herreshoff power transmission unit, and one that will appeal to the motorist caring for his own car, is the provision made for inspection of the clutch and transmission members. Access to the latter is by an unusually large plate, while the flywheel may be reached through a circular cover. Both covers are machined carefully, insuring an oil tight housing. In addition to the top plate, the trans-

Rear View of Motor, Showing Location of Control Pedals and Gear Changing Lever.

Digitized by Google

The Steering Gear Is of Ample Proportions and Provision Is Made for Adjustment. The Front Axle Is Sturdily Constructed of a One-Piece Drop Forging.

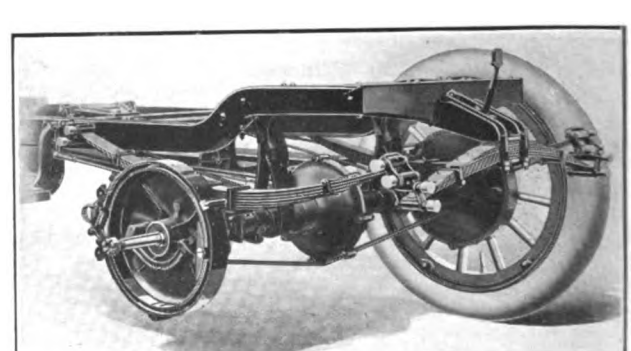
mission may be reached through an inspection plate on the right hand side. The three point suspension is effected by bolting the rear of the unit to a substantial and heavily reinforced cross member, and the design of the unit power plant is such that the motor or transmission may be removed easily, the operation involving but the loosening of a few bolts.

Straight Line Drive.

The designer of the new chassis lays great stress upon the straight line drive, this being possible through the low suspension of the power plant unit, and frictional losses in power transmission to the road wheels are reduced to a minmum. The propeller shaft is of chrome nickel steel, of large proportions, being 1.5 inches in diameter, fully protected by a substantial housing. But one universal joint is fitted, at the forward end of the propeller shaft, and the torsion tube is supported at the rear of the transmission, a ball and socket being employed, a design making for accessibility. Radius rods extend from the brake flanges to a point midway of the torsion tube. The pinion gear is of chrome nickel steel, carefully cut to exact size and end thrust is taken care of by large New Departure ball bearings.

Semi-Floating Type Rear Axle.

The rear axle is of the semi-floating type and the shafts of chrome nickel steel, 1.25 inches in diameter, rotate in Hyatt high duty roller bearings. It is of ample proportions and designed to withstand severe service. The bevel gear is of chrome nickel steel and the differential gears are of the same material. The unit is mounted upon Hyatt roller bearings. The shaft housing is of ample sized steel tubing and that of the differential cast iron, with provision made for inspection and replenishing the supply of lubricant.



The frame, which is bent up to clear the rear axle, is of hot rolled pressed steel, .15625 inch thick, having a channel depth of 3.5 inches and section width of two inches. Four cross members are employed, the two rear members being unusually substantial. The three point suspension feature of the new chassis is incorporated in the frame suspension, there being two supports at the front and one at the rear.

This is made possible through a semi-elliptic cross spring which is secured at its centre to a rugged extension of the rear cross member of the frame, and which is in turn shackled to the side semi-elliptic springs. The front end of the latter are shackled to the frame, and self-lubricating integral grease cups are incorporated with each bolt. The rear springs are of a high grade steel, 42 inches long, two wide and the construction involves eight leaves. The front springs are semi-elliptic, 34 inches long, 1.75 inches wide and comprise five leaves to each member. Provision is made for lubrication as with the rear members.

Sturdy Front Axle Construction.

The front axle is the I beam section type of drop forged, heat treated steel, 2.125 inches deep and 1.375 inches wide and has a drop in the centre, which is conventional practise. The spindles are of a high grade carbon steel, ample in proportions, and stops are provided which prevent the front wheels coming in contact with the fore and aft steering connections. The spindle bearings are plain. The tiebar is of steel tubing and is located at the rear of the axle, a commendable design.

The steering gear is at the left, of the worm and sector type, and is provided with adjustable ball thrusts. The angle of the steering column is 31 degrees and an 18-inch wheel fitted to an aluminum spider is employed. The gas control is by a lever on top of the spider and by an accelerator located between the clutch and brake pedals. The

The Three Point Suspension Is Incorporated in Spring Design and the Brakes Are Liberal in Size.

Digitized by Google

ignition control lever is eliminated as the time of spark is automatically controlled. The left pedal controls the clutch and operates the service brake while the right pedal actuates the emergency, a design permitting the operator to retain both hands upon the steering wheel.

Ample Sized Brakes.

Two sets of brakes are provided, both being located on the rear wheels. The service brake is of the external contracting type, lined with Raybestos, and the diameter of the brake drum is 14 inches and the face two, providing ample frictional surface. The drums are securely bolted to the rear wheel spokes, through swelled sections of the latter. The emergency brake is of the internal expanding type and also is lined with Raybestos. Both sets are provided with equalizers, the construction of which is unusually substantial. Provision is made for easy adjustment of either set.

The wheels are of the artillery type, 34 inches in diameter, 12 spokes each and of carefully selected second growth hickory. They are fitted with detachable demountable rims with 34 by four-inch tires, both front and rear, and one extra rim is standard equipment. The wheelbase is 124 inches and the tread standard.

Two Types of Bodies.

Two types of bodies are fitted to the chassis, a five-passenger touring having a fore door at the right, and a two-passenger roadster. The touring body is of sheet steel and is especially distinctive in appearance, due to its straight line design and roominess. Ample leg room is provided to the occupants of both the front and rear seats, the compartments being 31.5 and 29 inches respectively. All door handles, hinges, etc., are concealed, which with the absence of accessories on the running boards and well designed fenders make for an attractive model.

Special attention has been paid to the comfort of the passengers by utilizing deep and luxurious upholstery. The width of the front seat is 36 inches and depth 10, while the dimensions of the rear are 48 by 22. The upholstery is black leather, and the depth of the front cushion is 7.5 inches and that of the rear 9.5. All hardware finish is nickel plated, making for easy maintenance. The dash is finished in walnut and the speedometer is flush, presenting a neat appearance. The bodies are highly finished, the color being royal blue with black gear and blue wheels.

Full Equipment.

The equipment is unusually complete. The top is a full extension mohair with side curtains and dust boot of same material, and the windshield is plate glass of the clear vision type. The electric signalling horn is operated by a push button mounted upon the steering wheel, current being supplied by the electric lighting system. The headlights are electric and the side dash lamps and tail light are combination oil and electric, providing dual illumination. Robe and foot rails, rebound straps, floor mat, tool box, tire holders and a complete set of tools as well as a tire repair kit are included in the equipment.

The motor starter is an electrical unit operated by a press button and the capacity of the battery is such that the crankshaft of the engine may be revolved for a considerable period. This with the electric lighting system is now standard equipment on a car that is not only reasonable in cost, but distinctly attractive in appearance.

PYRO, A NON-FREEZING SOLUTION.

Those who motor in cold weather make provision for guarding the water of the circulating system against freezing by the utilization of a non-freezing solution. The U. S. Industrial Alcohol Company, 27 William street, New York City, is manufacturing and marketing a solution known to the trade as Pyro, a mixture which is claimed to be free from corrosive qualities as well as electrolysis. It is mixed with water in proper proportions and is said to be superior to the usual alcohol mixtures. The company publishes a booklet upon anti-freezing solutions and their uses, which will be mailed free upon application. It contains many hints that are particularly timely for motorists at this season of the year.

S. F. EDGE RETIRES.

An item of considerable interest to the American friends of S. F. Edge, London, England, is that he has sold his interest in S. F. Edge, Ltd., to D. Napier & Son, Ltd., and is relinquishing his executive work in the old concern, which has long been identified with the manufacture of Napier cars. Mr. Edge explains that he will continue to take a keen interest in the success of the Napier and will use one of these machines in preference to any other. This is not strange when it is remembered that it was through his winning of various contests in the early days of the industry that the Napier secured such a wide reputation. Mr. Edge was one of the pioneer manufacturers in England and his retirement is a matter of extreme regret in many circles.

NATIONAL CONTEST AND RACING NEWS.

Results in the Chicago Motor Club's Tour Around Lake Michigan---Stutz Sets New Records at Rockingham Park---Franklin Wins Desert Race---Stevens-Duryea Takes San Diego-Phoenix Event---Other Meets.

Undoubtedly the 1200-mile reliability tour of the Chicago Motor Club, around Lake Michigan, which came to an end Oct. 27, after seven days in the woods of northern Wisconsin and the Michigan peninsula, was the severest test to which cars have been put in any contest held during 1912. The event was run in two classes, one for touring cars and the other for roadsters. Fifteen cars started, 10 of which finished as contestants, and of these but three had perfect scores—a Staver in the touring division and two Molines in the roadster class.

The contestants were: Touring cars—J. Brolley, Velie 1; J. Hanson, Case 2; G. Knudson, Staver 3; A. Monckmeier, Staver 4; A. Monsen, Bergdoll 5; A. M. Robbins, Abbott-Detroit 6; H. Park, R-C-H 7; R. B. Gray, National 8. Roadsters—M. Luce, Velie 101; Robert Maypole, Stutz 102; Thomas Rooney, Bergdoll 104; Joseph Wicke, Moline 105; Frank Salisbury, Moline 106; G. Anderson, Stutz 109; Thomas Jones, R-C-H 110. Official cars—Harry Branstetter, Kissel-Kar, pilot; Vaught, Staver, pacemaker; Kavanaugh, Midland, starter; James Taylor, R-C-H, press.

The first day's run was from Chicago to Milwaukee, and aside from the heavy mud, caused by two days of rain previous to the start, there were few incidents. The National 8 was automatically withdrawn for lateness at control, but all other cars finished with perfect scores.

The second day brought the tourists to Escanaba, over even worse roads. The Stutz 109 was busy nearly all day pulling other contestants out of the mud and arrived at the control sufficiently late to earn a heavy penalization. The Velie 101 was forced to withdraw because its driver was obliged to return home on account of business. The Stutz 102 and R-C-H 110 also withdrew at this point.

Between Escanaba and Newberry, the third day, the cars wound their way for miles through pine forests, with long stretches of corduroy roads. At one point the tourists were pleasantly surprised by finding five miles of good macadam in the heart of the woods. Only two cars were penalized and these for taking on water.

The 65.2 miles between Newberry and St. Ignace were covered in five hours by most of the contestants. The road lay through deep sand along the shores of the lake nearly all the way, but the heavy rains had packed this so that it made comparatively easy going. The R-C-H 7 lost its way and became automatically withdrawn upon arriving in control 12 hours late. The crew was without food for 36 hours, for although sandwiches were carried in the car the basket was overturned in the mud and sand when one of the men jumped into the tonneau. The night was spent in Mackinaw City, the cars being ferried across the Straits of Mackinac.

It was at Mackinaw City that the Staver Dictator, a 1913 model, arrived from Chicago, it not having been completed in time to join the tour at the start. It left two days behind the tourists and three men took turns at driving and sleeping on the way, the only stop of any length being when all three slept for three hours on top of the warm boilers of a lumber mill in the woods.

From Mackinaw City to Traverse City the roads were found to be fair to good, and the fifth day's run was completed with but three additional demerits. The sixth day brought the tourists to Grand Rapids, the Abbott-Detroit 6 securing a record in penalization—1397 points for replacing a radiator, ripped open by the protruding branch of a tree. Only two cars were penalized on the last day's run into Chicago. At Ludington, the National 8, the entry of the Chicago Spring Wheel Company, which was equipped with a limousine body and which was automatically withdrawn for being late the first day, caught up with the party. It had been driven day and night since replacing one of the wheels, the loosening of which had caused the original trouble.

The work of the official cars was particularly worthy of mention. Had they been contestants there is little doubt that all would have received perfect scores, with the possible exception of the Staver. The R-C-H 7 also finished with the others, and but for losing its way into St. Ignace, it undoubtedly would have been perfect as well. The work of this contestant and the R-C-H press

car compared most favorably with that done by the more expensive machines.

The score at completion of tour follows:

Touring Division.

No.	Car	Penalty
4	Staver	0
1	Velie	5
3	Staver	8
2	Case	50
5	Bergdoll	298
6	Abbott	1400
7	R-C-H	*
8	National	*

Roadster Division.

No	Car	Penalty
105	Moline	0
106	Moline	0
104	Bergdoll	325
109	Stutz	2539
101	Velie	*
102	Stutz	*
110	R-C-H	*

*Withdrawn.

STUTZ AT ROCKINGHAM PARK.

Three postponed events were held on the mile track at Rockingham Park, Salem, N. H., Oct. 29, in which Stutz entries were victorious twice. In addition Harry Grant in a Stutz created a new track record for a mile, going the distance in 0:57.4. George W. Downes in a National set a new amateur mark for one mile on this track in 1:05.

Harry Grant also created a 25-mile track record of 21:03.6, with a Stutz. This machine was shod with Walpole tires, made by the Walpole Tire & Rubber Company, Walpole, Mass., a decidedly creditable showing.

The summary of the meet follows:

Ten Miles, Free-for-All.

Car	Driver	Time
Jackson	Cobe	10:54.8
Jackson	Basle	.....
Stutz	Grant	.....

Twenty-five Miles, 301-600 Inches.

Stutz	Le Cain	26:13.0
Jackson	Cobe	.....
Stutz	Grant	.....

Twenty Miles, Match.

Stutz	Grant	21:03.6
Stutz	Le Cain	.....
Jackson	Basle	.....

FRANKLIN WINS DESERT RACE.

Ralph C. Hamlin, driving a six-cylinder, air-cooled Franklin car, won the fifth annual Los Angeles-Phoenix desert race, Oct. 26-28, his time for the 511 miles being 18:10:22. Last year this race was won by Harvey Herrick in a National, the distance being 524 miles and the time 21:05:30. Hamlin has driven a six-cylinder Franklin in each contest between these two cities. In 1910 and again in 1911 he finished in second position. Charles Soules in a Cadillac was second this year and Fred Fuller in a National third.

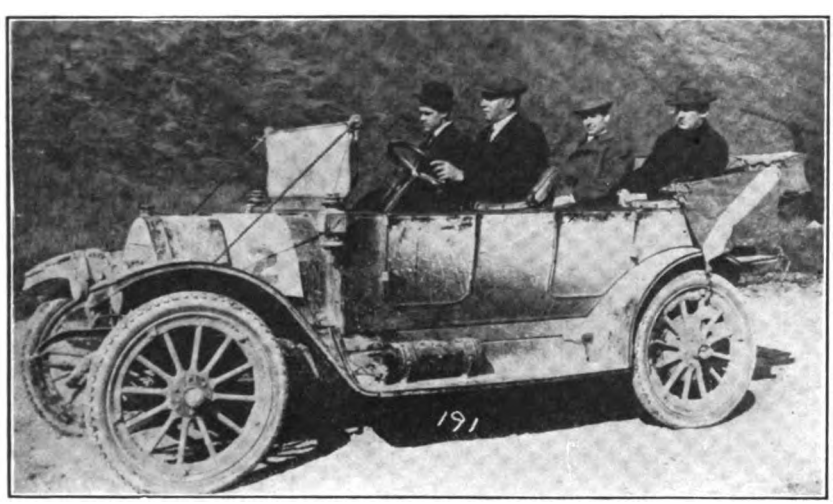
It should be stated that the road conditions were such as to occasion hard service from the tires, and in this respect Hamlin's experience is worthy of special mention. His car was fitted with Pennsylvania Vacuum Cup tires, made by the Pennsylvania Rubber Company, Jeannette, Penn., the only machine in the race to use this product. He changed but two shoes throughout the entire 511 miles.

The race was run in two stages, the first leg being from Los Angeles to Yuma, Ariz., in which Hamlin's Franklin also was a winner in 10:32:00. The distance was 304 miles. Soules' Cadillac was second and Faulkner's Simplex third.

Twelve cars started, those which did not finish being: W. F. Pipher, American; W. T. Brunnell, American; L. Nikrent, Buick; Leonard Jones, Hupmobile; C. S. Bigelow, Mercedes; G.

R-C-H Driven by James Taylor in Chicago Motor Club's Reliability Tests Around Lake Michigan, Showing Condition of Roads Encountered.

Digitized by Google



A. Ball, Schacht; A. Faulkner, Simplex; William Carlson, Winton. The following is the summary at the completion of the race:

Car	Driver	Time
Franklin	Ralph Hamlin	18:10:22
Cadillac	Charles Soules	18:54:05
National	Fred Fuller	19:45:06
Cadillac	W. W. Bramlette	23:18:27
Cadillac	S. A. McKee	23:46:31

THREE PERFECT IN MICHIGAN.

The Western Michigan reliability trials, under the auspices of the Grand Rapids Herald and Grand Rapids Automobile Club, came to an end Oct. 28, after covering 400 miles in four days. Three cars returned with perfect scores, as may be seen from the accompanying table:

Car	Driver	Penalty
Reo	Vandecar	0

W. D. Vandecar and Reo the Fifth, Perfect Score Combination in Recent Grand Rapids Reliability Tour.

Cadillac	Ecksburg	0
Oakland	Austin	0
Marmon	Kramer	1
Ford	Vallade	88
Cutting	Riekse	234
Overland	Oswald	868

ELECTION DAY MEET.

The chief event on the programme at the election day meet at Brighton Beach, Long Island, Nov. 5, was for a distance of 100 miles. Ralph Mulford, driving a Mason car, finished a winner in 1:24:11. The summary of the meet follows:

Ten Miles, Under 600 Inches.

Car	Driver	Time
Stutz	Lewis	9:17
Mercer	Wishart	...
National	Whalen	...

Five Miles, Under 301 Inches.
(Endurance Tire Trophy.)

Kline-Kar	Ormsby	5:01
Mason	Mulford	...
Mercer	Limberg	...

Ten Miles, Free-for-All, Handicap.

Mason	Mitchell	9:47
Stutz	Lewis	...
Mason	Mulford	...

100 Miles, Free-for-All.
(Election Day Derby.)

Mason	Mulford	1:24:11
Mason	Mitchell	.....
Mercer	Wishart	.....

SAN DIEGO-PHOENIX RACE.

Running simultaneously with the Los Angeles-Phoenix event was a second desert race from San Diego, Cal., to Phoenix, Ariz., in which D. C. Campbell in a Stevens-Duryea was the winner, his time for the 400 miles being 16:49:20. J. B. Houston in a National was second and W. E. Ferguson in an Apperson was third.

This also was run in two stages, Yuma being the end of the first leg. At this point the standing was: First, Houston, National; second, Campbell, Stevens-Duryea; third, Carl Washburn, Stutz. The National's time for the 193 miles was 8:05:00.

Eighteen cars left San Diego, and seven of these arrived in Phoenix. The others were: S. Campbell, Buick; C. T. Johnson, Mercedes; Frank Carlson, Franklin; F. C. Wood, Studebaker; E. De Lovelace, Knox; L. W. Griffith, Pope-Hartford; W. H. Smith, Columbia; H. A. Lees, Tincher; J. L. Fernando, Premier; Charles Gilstrap, Michigan; C. W. Biggs, Buick. The result:

Car	Driver	Time
Stevens-Duryea	D. C. Campbell	16:49:20
National	J. B. Houston	18:55:00
Apperson	W. E. Ferguson	19:07:29
Mitchell	R. L. Greer	21:16:00
KisselKar	W. T. Coop	22:47:52
Stutz	C. E. Washburn	38:50:00
Simplex	J. C. Rice	58:53:00

GLIDDEN IN NEW ORLEANS.

Charles J. Glidden and his Maxwell car arrived in New Orleans Oct. 28, having covered the route of the national tour, now postponed until spring, on scheduled time. It is understood that Mr. Glidden succeeded in awakening considerable interest in the tour, and that fully 100 entries are promised as a result of his trip.

THE BOSCH D 4 MAGNETO.

The Bosch D 4 magneto, manufactured by the Bosch Magneto Company, New York City, differs from those previously described in that it produces a spark at the gaps of the plugs without the aid of coils or transformer, the low-tension current being transformed into high-tension by the instrument. It is a true high-tension magneto, eliminating in the wiring plan the use of leads other than from the distributor to the plugs and that from the instrument to the switch and ground. The spark produced is of the arc type and the maker states that it is of such intensity that weak mixtures are ignited easily. Another quality of the instrument is that the motor may be started by it, dispensing with batteries and coils.

Variable ignition is secured through the interrupter mechanism, a device performing the same function as the timer or commutator of the battery and coil types of ignition systems. The Bosch instrument permits of a variation of 40 degrees, measured on the armature shaft. Although the magneto rarely gives trouble, its construction and operation will be of interest to motorists whose cars are equipped with this type, thereby familiarizing them with the few adjustments necessary, as well as the proper care of the instrument.

Construction of Armature.

The construction of the armature is illustrated at Fig. 2 which depicts a longitudinal cross view of the magneto. The armature is of the so-called shuttle type and rotates between the poles of three pairs of magnets, the movement in the magnetic field resulting in the induction of an electrical current in the winding of the armature.

The armature has two windings, a primary of coarse wire and a secondary of fine wire. The end of the primary wire or winding is connected to a brass plate through the centre of which is secured a screw. The latter serves to retain the interrupter in place, also to conduct the primary current to the lower platinum contact screw point which is mounted in the contact block of the interrupter mechanism, as shown at C. The retaining screw and its block are insulated from the interrupter disc which is in contact with the core of the armature and therefore capable of conducting an electrical current. The interrupter lever is pressed against the platinum contact screw by a spring, and as the lever member is connected to the armature core and primary winding through contact with the retaining screw, it follows that the primary circuit is closed when the interrupter lever is in contact with the platinum contact screw in the block member. When the contact points are separated by the rotating of the armature shaft the primary circuit is broken.

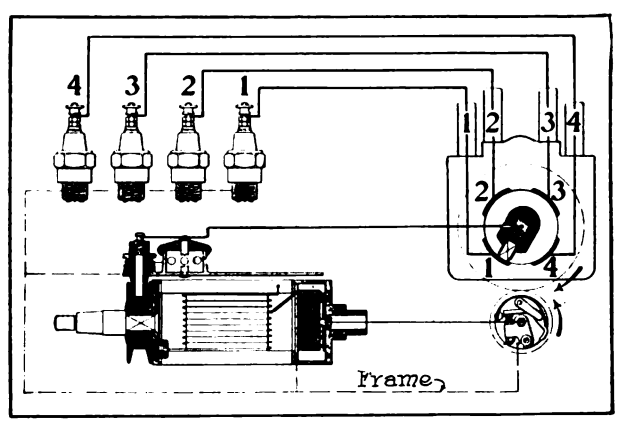

Fig. 1—Wiring Plan of Bosch D 4 True High-Tension Magneto.

Secondary Current.

The beginning of the secondary winding is so connected to the primary that the latter is a direct continuation of the former. The other end of the secondary winding is led to the collector, shown at B, on which is a brush insulated by means of the brush holder. The secondary cur-

Digitized by Google

rent is collected by this carbon brush, thence conducted by the bridge piece, which is provided with a contact brush, to the distributor brush holder, which carries a radial distributor brush, to the distributor plate.

In this plate are imbedded metal segments, the number of which corresponds to the number of motor cylinders, these being three, four and six in the D 3, D 4 and D 6 types, respectively. During the rotation of the distributor brush contact is made with the respective segments, conducting the high-tension current through sockets, contact plugs and cables to the spark plugs. The current flows through the metal of the spark plug, returning through the metal frame of the car, armature core and primary winding to the beginning of the secondary winding. It should be borne in mind that a circuit or path must be provided for the passage of an electrical current, be it primary or secondary.

Production of Spark.

The rotation of the armature in the magnetic field produces an alternating current in the winding of the armature, which attains its maximum twice during each revolution. The tension of the current generated is increased by first short circuiting and then opening the primary circuit through the magneto interrupter at the proper instant, this occurring twice during each revolution of the armature. The object of the breaking of the contacting platinum members in addition to the opening and closing of the primary circuit is to permit of the production of two sparks to each revolution of the armature shaft, and as four sparks are needed with the four-cylinder motor the shaft makes two complete revolutions.

The function of the condenser is to absorb the excess electricity which is present when the platinum points are separated, and which were it not for the condenser would fuse the platinum. The closing and interrupting of the primary circuit is accomplished by the interrupter lever and fibre rollers. When the lever is pressed against the platinum screw the circuit is closed, but when the lever is rocked by one of the rollers, the contact is broken and it is at this point that the ignition takes place and at the time the generated current attains its maximum strength.

Setting the Magneto.

If in the overhaul of the power plant the magneto has been removed and precautions were not taken to observe its installation it will have to be reset, which is not a difficult operation. If the connection between the driving shaft and that of the magneto is by a coupling, it will be a simple matter to bring the piston of the first cylinder on dead centre at the end of the compression stroke. The cover of the distributor is then removed and the position of the distributor brush should be on the segment corresponding to the lead to the first cylinder.

If the magneto is gear driven and the teeth have not been marked for remeshing, the operation involves more labor. The connecting bridge, dust cover, three-armed holder and cover of the distributor plate are removed in order to control the position of the armature and brush. The location of the piston of the motor is the same as

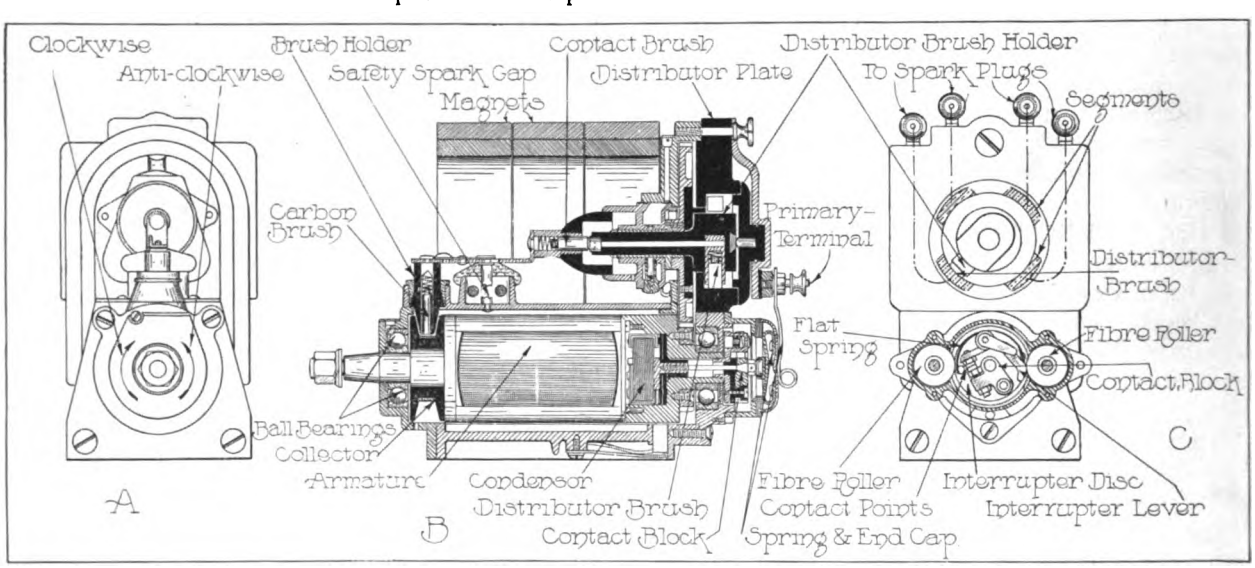

Fig. 2—Illustrating the Components of Bosch D 4 True High-Tension Magneto: A, Front View, Showing Direction of Rotation of Armature; B, Longitudinal Section; C, Presenting Circuit Breaker Mechanism and Distributor.

Digitized by Google

previously described. The armature is revolved until the brush is in the centre of the segment. For accurate results the distance between the end of the armature and pole pieces should be 11 to 13 mm with the D 3, 14 to 17 with the D 4, and 21 to 27 with the D 6. For two-cycle motors the distance will be less. A millimetre equals about one 25th of an inch. It is important that the direction of rotation be taken into consideration in timing.

Variation of Ignition.

The variation in the time of the spark is secured through the interruption of the primary circuit or by advancing or retarding the interrupter housing. A variation of 40 degrees on the armature shaft is possible, which on four-cycle motors is equal to 50 degrees on the crankshaft of a three-cylinder motor, 40 degrees on a four-cylinder and about 27 on a six-cylinder. The timing range on the crankshaft of two-cycle motors will be about half that of the four-cycle. In starting it is advisable that the spark be advanced slightly.

Care and Lubrication.

Two oil cups are provided and from eight to 10 drops of oil should be placed in each of these holes once every two weeks for a motor that is not in constant service, or once every 1000 miles. No other part of the magneto requires lubrication.

The wiring plan is presented at Fig. 1 and its simplicity is apparent. It will be noted that a wire is attached to primary terminal, Fig. 2 B, and is led to the switch, the other pole of which is grounded. When the switch is closed the primary winding is permanently grounded and the motor should stop. It will be noted by referring again to Fig. 2 B that a safety gap is provided, its object being to protect the windings of the armature against excessive voltages developed, as when a cable is disconnected from the plug and the engine is running, etc. In testing the discharges should not be allowed to pass through the gap for any great length of time, particularly if the motor be equipped with a second ignition system. In such cases it is absolutely necessary to ground the primary winding as described, by switching off the magneto ignition.

Testing the Magneto.

If faulty ignition occurs and the plugs are in proper order the magneto may be tested easily by removing the grounding wire and one of the spark plug cables from its terminal on the magneto. Crank the motor briskly and observe if a spark jumps the safety gap. If so, the instrument is operating properly. If no spark is noted, the operation of the primary circuit mechanism should be inspected. It may be that the retaining screw of the interrupter is loose or the interrupter lever does not make contact with the platinum screw. This lever should move freely. Its pivot works in a fibre bushing and oil should be kept from this material.

Another cause of trouble may be that the platinum points do not separate the correct distance when the lever passes over the roller. The distance should be .015625 inch and there is a metal blade attached to the adjusting wrench supplied by the maker for setting these points. Uneven, dirty or burned points may be responsible for erratic operation. When uneven, but only then, they may be trued up with a fine file and readjusted. By loosening the lock nut the screw may be moved up or down. If the motor fails to stop when the switch is thrown to "off," or stops sud-

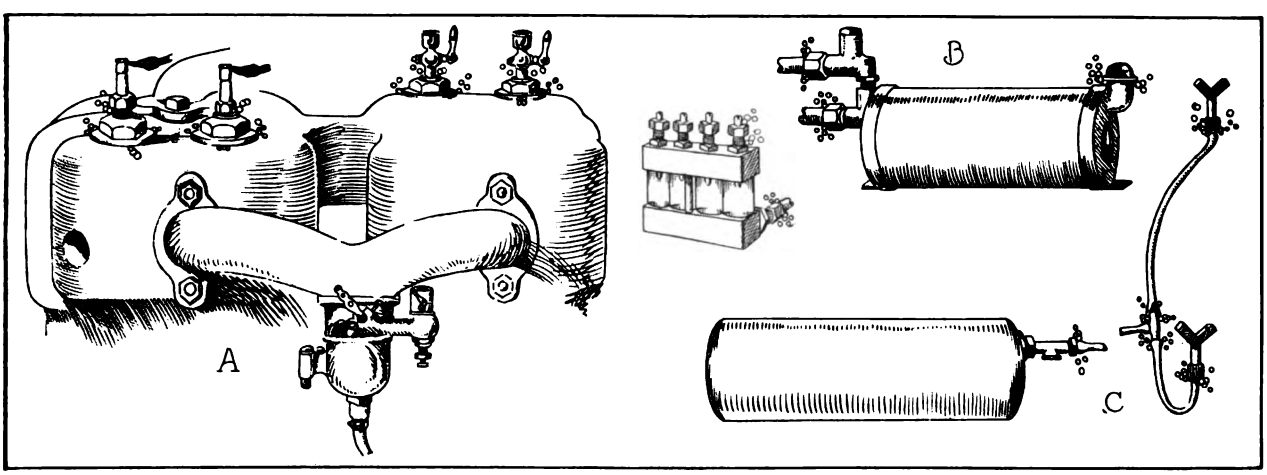

Fig. 3—Illustrating Simple Method of Testing for Leaks: A, Showing How Spark Plugs, Valve Caps and Priming Cocks May Cause Lost Compression; B, Why Pressure Feed Oiling Systems Fail; C, Indicating Leaks of Lighting System for Which the Tank Is Usually Blamed.

Digitized by Google

denly, it will probably be due to a grounding of the switch cable through chafing. The latter condition may be tested by removing the cable from the primary terminal of the magneto. If these simple tests fail to cure the trouble it is best to return it to the maker or to one of the service stations, as all parts needing attention are readily accessible and other components should not be disassembled.

DETECTING GAS AND OIL LEAKS.

The efficiency of a motor depends, in addition to its working parts being in good condition, upon tight joints, as the valve caps, priming cocks, spark plugs, etc. Such members should be absolutely gas tight if the motor is expected to deliver its maximum efficiency and operate smoothly.

Take for example the spark plug. At a first glance it would appear a simple matter to replace a faulty member with a new one; but if every plug were carefully tested it would be surprising to note how many would be found to be leaking. And it may be stated that such a condition might exist even after the plug had been screwed home tightly.

The writer has noted plugs which had been set up with a large wrench, yet when tested would leak because the threads were poorly cut or those of the valve cap or cylinder had become injured through carelessness. Another source of leakage of compression is the valve cap, some designs of which are such that it is difficult to secure a gas tight joint without the aid of gaskets.

The usual way of testing for leaks after the valves have been ground or the motor overhauled, is to cover the joints with cylinder oil and with the engine running note if bubbles appear. With minute leaks this method is not as satisfactory as the soap bubble treatment, but the former is generally employed because it is more convenient.

It is an easy matter to mix up some soap suds which when applied to the part to be tested will indicate the trouble more thoroughly than will the heavier fluids. The material may be utilized for testing the spark plugs, valve caps and priming cocks as illustrated at Fig. 3 A and for oiling systems of the pressure feed type as indicated at B. Regarding the latter it may be stated that any loss of pressure will affect the operation of the system, and when the lubricant fails to flow the different connections should be tested with soap suds as shown in the sketch.

Many owners complain of considerable variation in the capacities of different gas tanks when the trouble is due to leaking connections. Usually the tank is installed in a hurry by the garage attendant who is satisfied with a casual inspection—by a lighted match or the sense of smell. The application of soap suds to the parts as indicated at C will frequently reveal unsuspected leaks. The economy effected will amply repay for the trouble.

STARTING IN COLD WEATHER.

With the appearance of cold weather motorists are complaining of trouble in starting the motor after it has stood all night in an unheated building. There appears to be more complaint than in former years, and it may be safely asserted that the difficulty experienced is due to the low grade of gasoline employed.

While priming the cylinders through the petcocks or by removing the spark plugs is an excellent plan, care should be exercised not to flood the cylinders. If upon priming the motor does not start do not continue to pour fuel into the cylinders, but open the petcocks and with the switch on, crank the engine briskly. Usually it will start after a few revolutions.

Those who motor considerably in cold weather and expose their machines for any length of time when not running, will find that starting will be facilitated if the priming can is filled with 74 or 76 test gasoline. It can be procured, and a quart is not expensive and will last for some time.

TIME FOR HOT WATER JACKETS.

Those motorists who make it a practise to shut off the supply of hot water of the circulating system to the water jackets of the carburetor should open the petcocks and allow the heated fluid to warm the mixture chamber now that cold weather is at hand. The utilization of water jacketed carburetors facilitates the vaporization of the fuel, although it does not make starting any easier when the motor is cold. It is possible that the joints may leak and it is a good plan to start the motor up and examine all connections, correcting any leaks that may develop.

The Wisconsin Motor Manufacturing Company, maker of the Wisconsin motors, is occupying its new, modern plant at West Allis, Wis., which affords increased production facilities.

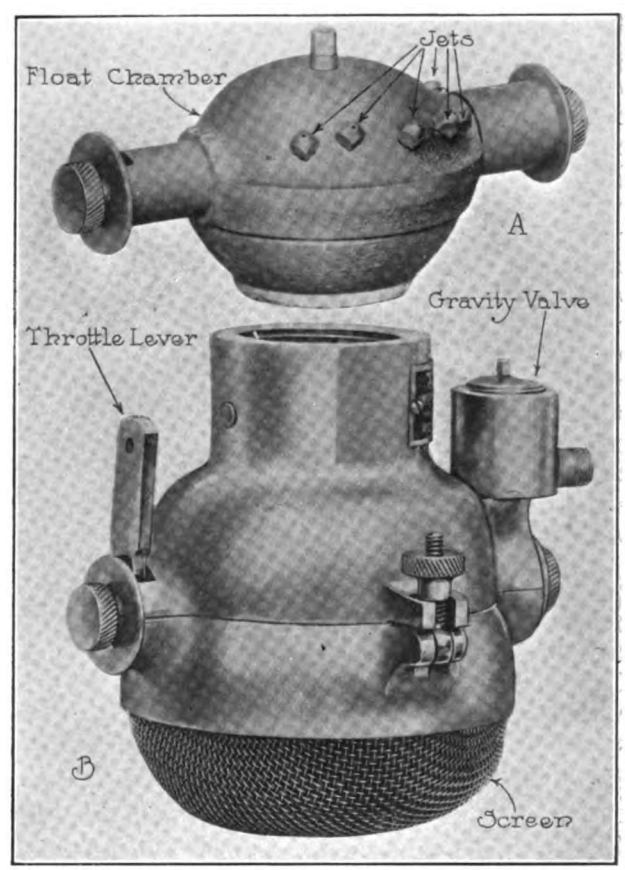
CARTERCAR MAKES HARD CLIMB.

A Cartercar, made by the Cartercar Company, Pontiac, Mich., and driven by Frank Davis, has accomplished the hitherto considered insurmountable mountain climb between Forest and Allegheny, Cal. The Cartercar made the climb on the first test, and the driver attributed the feat to the friction transmission with which the car was equipped and which gave great pulling leverage.

WHITE CARS IN 'BUS SERVICE.



The five White sight-seeing cars known as the White Legion, and made by the White Company, Cleveland, O., which have been operating between Ashford and Longmore Springs, Wash., throughout the summer just passed, have been taken to the White garage at Tacoma, Wash., for overhauling and repairs. Each of the cars travelled an average of 2500 miles this season, the total number of passengers handled by the squadron being approximately 15,000. According to J. E. Hickey, Tacoma representative of the White Company, during the whole season there was not a single delay due to breakdown or faulty equipment.

A. B. C. NON-ADJUSTABLE CARBURETOR.

A carburetor which presents interesting features, in that it is non-adjustable and that a certain component may be removed easily, thereby preventing the operation or theft of the car, is the A. B. C. vaporizer brought out recently by the International Accessories Manufacturing Company, 114 Liberty street, New York City. The design is compact, as will be noted by the accompanying illustration, which depicts the float chamber A removed from the carburetor B.

There is no compensating air valve of any description, the air being drawn in through a screen at the bottom, and a quality of this construction is that the meshes prevent danger from backfire, the principle involved being that of the miner's safety lamp. Although not adjustable, it is stated that the multiple jets provide a correct mixture ranging from the minimum to the maximum speed of the motor. This automatic control is secured through the five jets having different openings, and these are utilized proportionately to the demand of the motor. In other words, it is a combination of carburetors in that one or more jets are employed, according to the opening of the throttle.

The maker states that the correct proportions are obtained by the rotation of the float chamber in conjunction with the operation of the throttle valve, and that the former movement varies the amount of fuel being fed through the jets, as well as the number used. Among other advantages claimed of the device is that the float chamber may be removed easily, the operation involving the loosening of a thumb nut, when the screen section may be swung down and the float removed. It is pointed out that this arrangement

The A. B. C. Carburetor, Which Presents Interesting Features: A, the Detachable Float Chamber Having Five Jets; B, Front View Illustrating Gravity Valve, Control Lever and Screen Air Intake.

prevents the unauthorized use and theft of the car.

It is held by the company that foreign elements do not affect the function of the vaporizer as in tests the float chamber has been partially filled with water and dirt without interfering with its operation. The carburetor is equipped with a gravity valve device which automatically shuts off the supply of fuel when the float chamber is removed. Economy of fuel, flexibility, compactness and light weight are qualities emphasized of the A. B. C. carburetor.

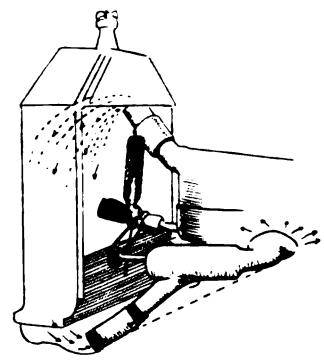
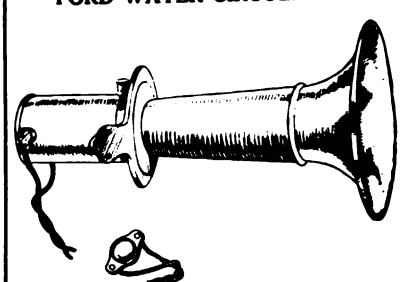
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS



The Ford Water Circulator is manufactured by the Fulton-McCutchan Company, 1146 Michigan avenue, Chicago, and as the names implies, is designed for attachment to Ford motors cooled by the thermo-syphon system. It comes complete and includes in addition to the circulator, a split pulley and a spring belt. The former is secured to the fanshaft, which actuates another pulley operating a worm screw located in the intake water manifold. The rotation of the screw member forces the cooled fluid taken from the bottom of the radiator through the water jackets, thence to the cooler. The rate of flow is augmented with increasing motor speeds and the maker states that the efficiency of the power plant is increased thereby. The circulator is constructed of aluminum and weighs but three pounds.

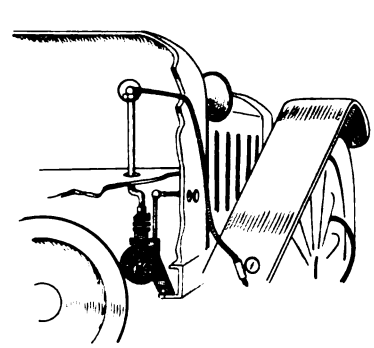
★



Silverkote is manufactured by the Page-Lester Company, 125 West Van Buren street, Chicago, and a little of the fluid placed upon a cloth will, the maker states, convert the brass lamps and other accessories of the car into a brilliant silver finish. The material is not injurious to the hands or metal, is applied easily and is said to have very durable wearing qualities. It comes in a bottle the contents of which will silver plate the brass work of the average car twice.

★

The Newtone Superior Horn is produced by the Automobile Supply Manufacturing Company, 220 Taaffe Place, Brooklyn, N. Y. It is designed to meet the demand for a popular priced signalling device and in it are incorporated the same high grade workmanship and material noticeable in the product of this company. The design is attractive, well finished and economical of current, requiring about 2.5 amperes. The company states that a battery will supply current for five months without recharging and as the working parts of the horn are enclosed they are not affected by road dust. The horn comes complete with ample length of flexible cord, push button, etc., and the design of the securing bracket is such that it may be attached easily.



FORD WATER CIRCULATOR

NEWTONE SUPERIOR HORN

SILVERKOTE

TWO MINUTE TIRE PUMP

★

The Two Minute Tire Pump, produced by the Racine Engine & Machine Manufacturing Company, Racine, Wis., is a small, compact device actuated by the flywheel of the motor. It is permanently attached to the frame of the car underneath the footboard. A suitable tubing leads from the cylinder of the pump to the dashboard and provision is made for the attaching of a flexible hose having a pressure gauge, etc. Normally the friction wheel of the pump is not in contact with the periphery of the flywheel. When the service of the pump is desired, a small brass knob on the side of the car is turned, which throws the pulley of the pump into contact with the flywheel, the rotation of which operates the pump developing pressure.

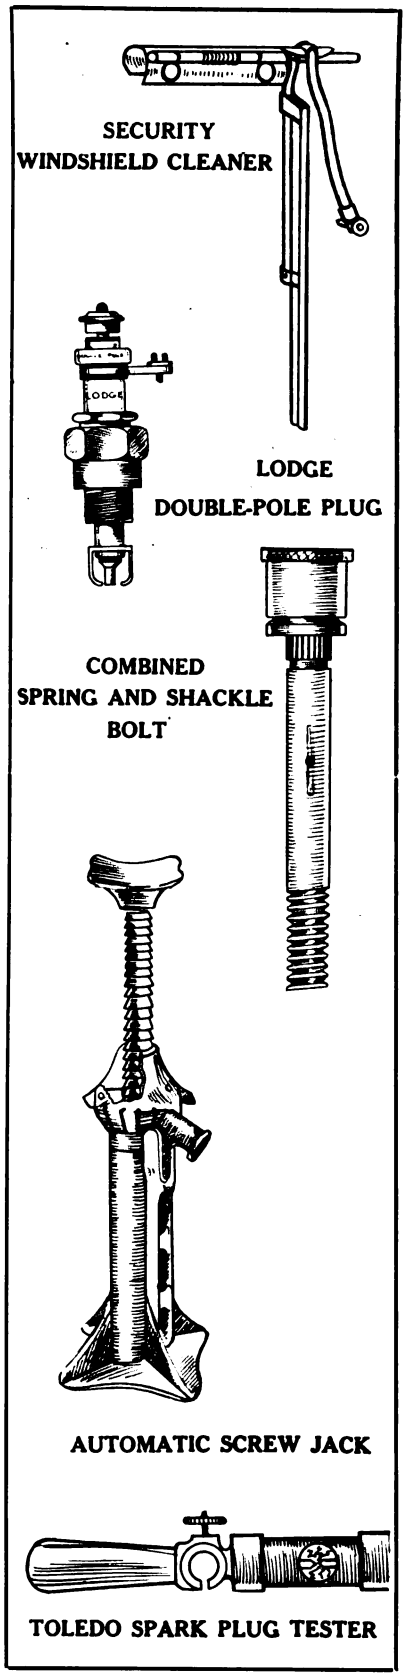
★

The Security Windshield Cleaner is marketed by the Eclipse Specialty Company, 250 West 54th street, New York City. By a simple movement of the hand dust, moisture, etc., are quickly removed by a cleaning arm provided with suitable material. The design of the cleaner is such

Digitized by Google

that it will fit any type of windshield and the maker states that it does not interfere with the folding of the sections. Being actuated by one hand it does not disturb the operation of the car and the cleaning arm automatically returns to normal position.

★



Lodge Double-Pole Spark Plugs permit of dual sparks in the combustion chamber of the explosive type of motors and without altering the ignition system, thereby increasing the efficiency of the power plant. The plug is so constructed electrically that two simultaneous flames are produced by the high-tension circuit, the installation being made easily. This is made possible by two secondary connections or terminals on the plug, to which the wires from coil or magneto are secured. The plug is constructed of high grade material and the Kimball Manufacturing Company, Motor Mart, Park Square, Boston, is agent.

★

Spring and Shackle Bolts are subject to considerable wear and when not lubricated properly require replacement. The Electric Welding Products Company, Cleveland, O., is manufacturing spring and shackle bolts of high grade open hearth steel, machined, case hardened and ground to size. The bolt is provided with a grease cup with screws over the top of the bolt bed and when rotated forces lubricant through the bolt into a groove. The cap is prevented from loosening by a spring in the bolt head which engages with recesses inside the cap each quarter turn.

★

The Automatic Screw Jack, marketed by the Garage Equipment Manufacturing Company, Milwaukee, Wis., will appeal to motorists desiring a light weight, compact, folding jack. It combines the advantages of the screw and lever devices and is equipped with an automatic release which makes it possible to drop the head to a normal position by a simple movement of the hand. It also permits of raising the head to the desired position. This is accomplished by spring jaws engaging with the steel screw member. Release of the jaws is secured through compression. The actuating lever or handle is pivotally mounted, making it possible to stow the jack in a very small space in the tool box. It is made in three sizes having lifting capacities ranging from two to five tons, and is moderately priced.

★

The Toledo Spark Plug Tester is a product of the Toledo Auto Devices Company, Toledo, O. As the name implies it is designed for locating faulty ignition and a quality claimed of it is that the operation requires but a few seconds. The handle is well insulated and a terminal is provided for attachment. The tester is equipped with a spark gap device by means of which the action of the secondary or high-tension current may be observed.

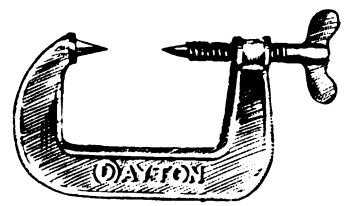
★

The Dayton Spring Spreader, manufactured by the Dayton Malleable Iron Company, Dayton, O., is a practical and inexpensive tool for the owner as well as the garage man. It comprises a clamp having a fixed point and a similar member on a threaded rod which is actuated by a winged handle. The points are placed between the leaves and the threaded rod turned by hand, a movement

Digitized by Google

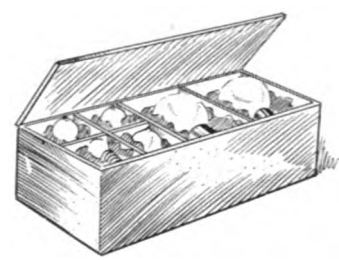
spreading the leaves so that the members may be cleaned and lubricated without loosening the spring clips or jacking up the body. The spring spreader is adjustable to any standard size spring.

★



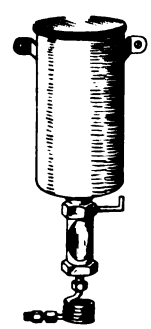
The Howard Lamp Chest is the product of the Howard Miniature Lamp Company, 237 Academy street, Newark, N. J., and is designed for the safe keeping of electric bulbs utilized with the lighting system of the motor car. The box is sturdily constructed and covered with cloth. Six compartments are provided, two for the headlights and one each for side, tail and speedometer globes, and the lamps rest in shock proof material. The case accompanies each outfit of Mazda lamps purchased of the company.

★



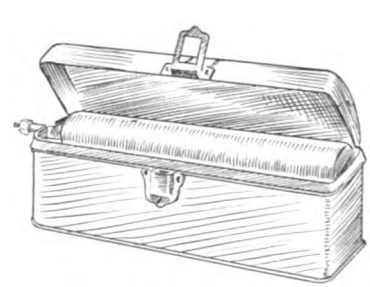
The Nelson Primer is marketed by the Nelson Manufacturing Company, Randolph and Jefferson streets, Chicago, and is utilized for priming the gasoline motor from the seat and making easy the starting of the engine. The vessel holding the fluid is small and compact and is attached to the dashboard by screws. The lower extremity of the device is equipped with a manually operated valve, also a sight feed glass, the latter being for the purpose of enabling the operator to measure the quantity of gasoline being used. The fuel is conveyed to the intake manifold or desired place by copper tubing which is equipped with a coupling. The maker states that it is attached easily, does not require soldering, and that by its use the motor may be primed readily.

★



The Electric Star Headlights are manufactured by the Milwaukee Bronze Casting Company, 119 Clinton street, Milwaukee, Wis., and are high grade and moderately priced lamps. A quality of these members, which are made in various styles to meet individual requirements, is that but one screw is utilized in their entire construction, rivets and solder being dispensed with. The material employed is cast aluminum, highly finished and silvered, and the convex lenses are laid in rubber, which makes the lamps dust and water proof, eliminating opportunity for tarnishing. The company manufactures a wide variety of electric lights, including tail, side, dash, etc.

DAYTON SPRING SPREADER



HOWARD LAMP CHEST

NELSON PRIMER

ELECTRIC STAR HEADLIGHT

HAYES GAS TANK BOX

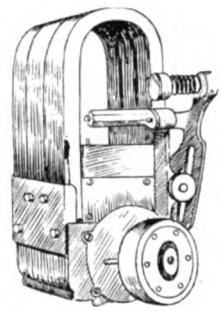
★

The Hayes Gas Tank Box is the product of the Hayes Manufacturing Company, Detroit, maker of battery and tool boxes, and is designed for storing the gas tank out of sight as well as preventing its theft. It is constructed of sheet steel and all joints are electrically welded, making for sturdiness. It is finished in baked, black enamel and equipped with a special lifting lock. The tank is made in two sizes for model B and E Prest-O-Lite tanks, and in designs suitable for attachment on either running board and in both directions insofar as the lead from the tank is concerned. The boxes are made plain or with aluminum mats as desired.

★

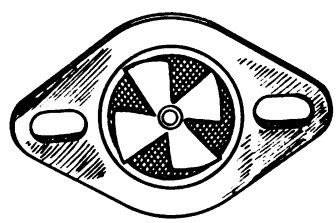
The K-W Lighting Magneto, manufactured by the K-W Ignition Company, Cleveland, O., is a special instrument brought out recently by the maker to meet the demand for a compact, popular priced generator operated by the energy of the automobile motor. The magneto delivers current direct to the lamps and the maker states

Digitized by Google



it will light two 16 candle-power bulbs. The use of brushes, commutator, contacts, etc., is eliminated, the only moving part being the rotor, which revolves in high grade ball bearings. The magneto is installed easily, being especially adapted to cars having exposed flywheels which are utilized to drive the magneto by means of a friction wheel. The latter is provided with a spring device which automatically maintains the proper contact. The instrument may be employed in place of batteries if desired. The entire equipment includes magneto, lamps, switch, wire and bulbs.

—— ★ ——

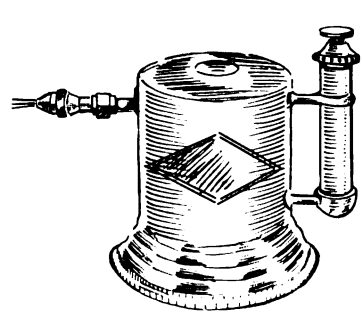


The Automizer is the product of the Automizer Manufacturing Company, Canton, O., and is designed for insertion in the intake pipe or manifold between the carburetor and the cylinders. The object of the device is to break up and convert into useful vapor any particles of fuel which have not been aerated by the vaporizer. The Automizer has no moving parts, being constructed of thin sheet metal having an aperture of the same diameter as the intake pipe which is fitted with a wire gauze. Four stationary blades are secured to the screen member and the mixture striking these projections is converted into a fine mist.

—— ★ ——

The Turner Motor Washer is the product of the Turner Brass Works, Sycamore, Ill., and is a compact device resembling in appearance and construction the gas torch. Instead of a burner a nozzle member having a fine opening is provided through which gasoline or other cleansing fluids are forced under pressure. The handle contains the pump mechanism and a few strokes develops a high pressure. By it dirt or grease may be quickly removed from the motor or chassis components and places not easily accessible by hand are reached. The nozzle is adjustable so that a spray or a fine stream may be employed. The capacity of the washer is one quart.

K-W LIGHTING MAGNETO



THE AUTOMIZER

V-RAY SPARK PLUG

SOLDERLESS CONNECTOR

TURNER MOTOR WASHER

—— ★ ——

The V-Ray Spark Plug is manufactured by the M. M. M. M. Co., Inc., Marshalltown, Ia. A quality claimed of it is that it is impervious to oil or carbon deposits as the base of the shell is provided with four extensions, these forming the gaps or air passages. Another feature of the plug is the terminal, which is so constructed that the thread of the electrode is protected from injury. High grade material and durability are qualities emphasized of the plug.

—— ★ ——

The Solderless Connector, marketed by the Dosset Manufacturing Company, 242 West 41st street, New York City, is designed for use on cables, stranded or solid wires, rods, tubing, etc. It comprises two sleeves, two compression nuts and a nipple. The latter is bored to take a certain size wire while the ends are tapered inside and threaded outside. The sleeves are short pieces of tubing, slotted lengthwise and tapered at both ends. One extremity of each compression nut is also tapered. When the nuts are screwed upon the nipple the tapers on the nuts approach those of the nipple and the pressure brought about decreases the diameter of the sleeves and grips the strands of the wire. Each cable is held in place by an independent nut, permitting the use of the device for connecting together any two sizes of cable, etc.

HORSEPOWER RATING.

The American public, and particularly the American motorist, cannot fail to be interested in the action of the British government in adopting the report of its committee respecting horsepower rating. It would appear that, insofar as the internal combustion motor is concerned, the situation is not changed, with the exception that the old R. A. C. formula, or as it is termed in this country, the S. A. E. rating, has been adopted officially by Great Britain. The same situation has obtained in this country, in a measure, since many of the states are now and have been for some time computing horsepower for taxation purposes under this formula.

The result is of particular interest because the committee had wide latitude in the matter, and numerous other formulae were presented to it during its investigation. Several of the motoring prints in Great Britain have long contended that the R. A. C. formula did not properly define the horsepower of a motor since the stroke was not taken into consideration in any other manner than with the assumption of a piston travel of 1000 feet a minute. It is maintained that few motors, especially after they have been in use for some time, are capable of developing their rated horsepower on the road.

This condition appears to have been recognized in the sixth recommendation of the committee, which provides for an average horsepower rating under certain conditions. The entire recommendation of the committee is briefly set forth elsewhere in this issue. A careful study of this last paragraph will at least create the suggestion that possibly the committee has not reached the final solution for which it aimed in the beginning.

So long as motorists must submit to a system of taxation based upon the horsepower rating they must be interested in the formula under which this horsepower is computed. This is held to have a certain influence over the trend toward the long stroke motor in Great Britain, and as a result many British owners have contended that the only proper method of determining horsepower was one in which the piston displacement was taken into careful consideration. It would seem that the official adoption of the R. A. C. rating would not entirely eliminate this discussion, but possibly this will depend upon the interpretation placed upon the sixth recommendation of the committee.

'BUS LINES VS. STREET CARS.

Within the past few months engineers, who have made a careful study of the problem, have been advising the installation of motor omnibus lines in many of the colonies of Asia and Africa, for instance, in place of street cars. This opinion has been based upon the suggestion that the automobile would prove the logical equipment of the future, and that there were many reasons why it should result in a better financial investment. The plan is one which may be considered with profit in certain sections of America.

That these engineers had given the matter careful study was conceded, and it now appears that they only needed access to the financial records of the companies operating in London to furnish a satisfactory foundation for their investigation. It is stated that in the 11 months ending Sept. 30, the receipts of the London General Omnibus Company showed an increase of about $2,550,000, while the London County Council

Digitized by Google

Tramways showed a decrease of about $240,000 during the 23 weeks ending Sept. 4. In connection with this statement is the announcement that the capital invested by the tramways is about four times that invested by the omnibus company.

While these figures would make it appear that the number of passengers carried by the street cars must have decreased considerably, this is not actually the case, since the tramways have sought to secure business by giving special rates for working men at certain hours and adopting a return fare system on certain lines. It would appear therefore that the motor 'buses are carrying the profitable traffic, while the street cars are securing more and more the unprofitable business. The 'buses make no special inducements in fares, but pick up passengers in the busy centres in the working hours of the day when nearly half of the street cars are standing idle in the car barns.

RESPONSIBILITY OF SPECTATORS.

While it has been demonstrated that exhibition aviation meets do not pay from a financial viewpoint, it probably is true that individual aviators find satisfactory remuneration in giving exhibition flights at state fairs and similar public gatherings. Doubtless these flights have a certain value in the ultimate solution of the problem of aerial navigation, although the operators often are constrained to perform feats of daring which have no legitimate place in the study of the science.

At one time aviators felt compelled to take unwarranted chances because of the demand for a flight despite adverse conditions. Happily, the public has come to understand this situation in a measure, but there is still room for comment concerning the attitude of spectators with reference to crowding about the aviator and machine, as is brought out in a number of recent accidents.

In England, for instance, one of the most proficient aviators lost his life recently because, when some portion of the machine failed in midair, he attempted to make a landing at a point not completely occupied by the crowd. Several such accidents, many of which have resulted no more seriously than a badly damaged machine, have taken place in this country. The aviator is commended for his thoughtfulness in accepting the possibility of his own death to save the lives and limbs of the public, but there is much reason for believing that the total number of accidents would be greatly reduced if the spectators could be made to appreciate that they endanger their own lives by crowding too closely around an aeroplane about to make flight.

OPENING YOSEMITE VALLEY.

Secretary of the Interior Fisher has been holding a conference with automobile men, particularly those representing the Automobile Club of California, with reference to opening Yosemite valley, one of the national parks, to the motor car. At the conclusion of the conference he said:

"If automobiles are to be admitted to the rim of the valley there should be a way provided by which they can leave it without having to retrace their course. That recommendation you may consider made. What we need is the funds to carry it out."

This appears to be the present result of the public demand throughout the country for the removal of the restrictions concerning motorists in national parks. In every case the investigation has concluded with the statement that the problem is one for the engineers to solve. Apparently this is to be taken as meaning that if motor cars are to be admitted to these public preserves, special roads must be made for their use.

ELIMINATION OF GRADE CROSSINGS.

It is of particular interest at this time to note that the civil service commission of New York State has asked for an appropriation of $1,500,000 to be expended in the elimination of grade crossings. This represents one-quarter of the total estimated expense for this work, and the remainder of the $6,000,000 must come from the railroads.

Of course, it is probable that the legislature will not grant the request until all parties concerned have had full opportunity to be heard in the matter. It would seem, however, that even the expenditure of $4,500,000 would prove a good financial investment to the railroads, in view of the increasing number of fatal accidents which have occurred by reason of the fact that existing grade crossings have not been suitably guarded.

BUSHING VALVE GUIDES.

One of the sources of auxiliary air is the valve guides. When provision is not made for replacing the worn bushings with new ones and the guides are integral with the cylinder casting the repairman is called upon to either bush the parts or true the opening, make and fit new valve stems. The amount of wear, cost, etc., would have to be considered, of course.

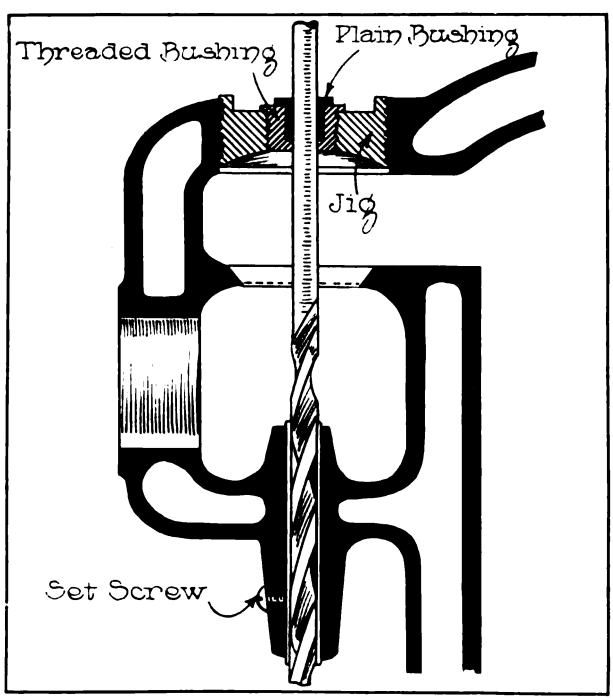

Fig. 1—Rebushing Worn Valve Guides with Standard Steel Tubing.

Steel tubing may be procured in varying inside and outside diameters for bushings and with a four-cylinder car eight bushings will be required, the measurements depending upon the design of the motor. Assuming that the inside diameter of the bushing when finished should be .375 inch, the diameter of the valve stem, the walls of the bushing should be approximately .0625 inch thick, making a total outside diameter of the tubing .5 inch.

As the opening of the tubing is not always concentric with the outside diameter, before drilling or reaming out the bushings in the cylinders it is advisable to true up the bushings. This may be accomplished by placing on an arbor of the lathe and skimming off a trifle from the outside of the tube.

Previous to fitting the bushings to the cylinders a jig should be constructed so that an accurate hole may be assured when drilling or reaming. The jig may be made fitting a bushing to the opening of the spark plug cap as shown at Fig. 1. The bushing should be threaded to fit the opening as shown in the sketch, and should have an inside diameter equal to that of the hole to be drilled or reamed for the reception of the tube bushing. This will insure that the holes drilled or reamed will be accurate.

When the work of preparing the openings has been completed, the bushings should be inserted, making a drive fit so that the walls of the tubing will be compressed slightly, permitting of reaming or drilling for accuracy and for a close fit of the valve stems.

For drilling the tubes another bushing will be needed and it should fit inside the threaded member as illustrated. Before employing the spark plug cap make sure that its hole is concentrically accurate, and if not a special cap will have to be made if a good job is to be secured.

After the bushings have been drilled and the valve stems fitted properly, the former will have

Digitized by Google

to be secured in place. This may be accomplished by drilling a small hole, .125 or .1875 inch, through the guide and into the bushing. The point of the drill should just enter the wall of the tubing and the recess should be just deep enough so that the screw will grip easily.

The thread must be such that it will grip the screw firmly and the latter should have a taper point. Care should be exercised that in screwing up the retaining member its point does not crush the walls of the bushing, which are thin.

FIGURING AREAS OF CIRCLES.

In rebuilding cars, such as changing a touring machine into a roadster, for instance, the repairman is required to calculate the areas or circumferences of circles when planning the fuel tank, etc. Usually the tinsmith is called upon to give capacities for given dimensions and after having obtained these the owner decides that he will fit a tank carrying a larger supply of fuel, necessitating another visit to the tinsmith.

To obtain the capacities the area of a cylinder of a tank multiplied by its length gives its volume or capacity. To ascertain the circumference of a circle multiply the diameter by 3.1416. This is the constant which is denoted by the Greek letter π (pronounced "pi" like "pie.") The circumference of a circle 34 inches in diameter is secured as follows: 34x3.1416=106.81 inches. For instance: A car having 34-inch tires will travel 106.81 inches to complete one revoluton of the wheel.

To find the area of a circle from its diameter, multiply the square of the diameter by one-quarter of the constant π. One-fourth of 3.1416 is .7854. If D represents the diameter, the area equals D^2x.7854, or area equals DxDx.7854.

The area of the head of a piston five inches in diameter is ascertained as follows: 5x5x.7854=19.635, and the piston displacement of a cylinder of that bore is 19.635xstroke. Assuming that the stroke is five inches the piston displacement would be 19.635x5=98.175 cubic inches for one cylinder.

To obtain the piston displacement of multiple-cylinder motors multiply that of one by the total number of cylinders. For example: The piston displacement of one cylinder having a five-inch bore and stroke is 98.175 cubic inches and that of a four-cylinder motor would be 4x98.175=392.7 cubic inches. Cylinders of different sizes may be figured similarly.

An accompanying table gives the circumferences and areas of circles of varying diameters from .015625 inch to 13.5 inches inclusive. To employ the table: Find in the first, fourth, seventh or 10th columns the diameter in inches of the circle, the circumference or area of which is desired. Opposite the diameter in the next column will be noted the circumference of the circle of that diameter, and in the next column to the right will be found the area of that circle.

For example: It is desired to find the circumference and area of a circle five inches in diameter. The column diameter is located in the table and the figure five found. Opposite it is given in the circumference column the circumference which is 15.708. Another column is marked area and that of a five-inch diameter cir-

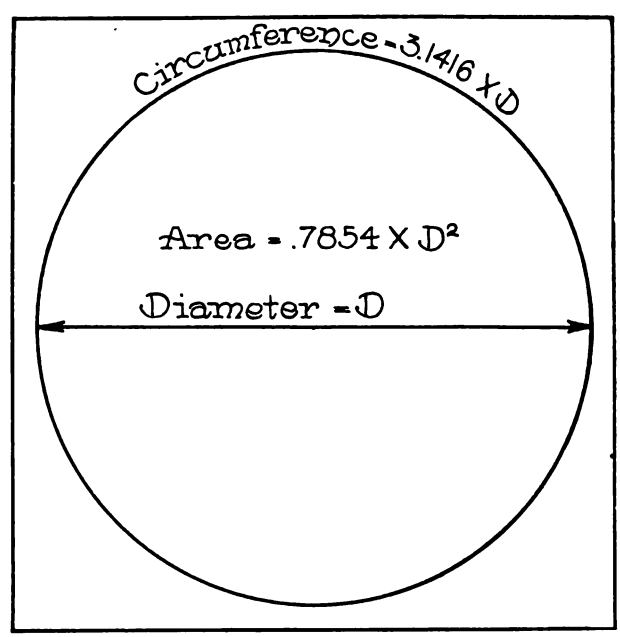

Fig. 2—Illustrating the Measurement of Circles to Obtain Areas, Etc.

cle is 19.635, in square inches. Having obtained the area in square inches it is an easy matter to ascertain the piston displacement by multiplying the area by the stroke, five inches. For example, 19.635x5=98.175 cubic inches for one cylinder. For four cylinders it would be 98.175x4=392.7.

It will be noted that circumferences and areas of circles up to 27 inches in diameter may be secured from the table, though only those up to 13.5 inches diameter are given. For circles between 13.5 and 27 inches diameter, divide the diameter by two and multiply the corresponding circumference by two and the corresponding area by four. For instance: The diameter of the circle is 20 inches. This divided by two equals 10, the cir-

Digitized by Google

cumference of which is 31.416. This multiplied by two gives 62.92, the area of which is 78.54. This multiplied by four equals 314.16, the area desired.

THE AUTOMATIC VALVE GRINDER.

One of the most common tasks in the repair shop is the grinding in of the valves on the gasoline motor. It is work that cannot be rushed as the valves must be ground until a good seat is secured, else the time is wasted. Formerly the operation was performed by hand utilizing a screw driver or a bit stock, but the progressive garage now employs a tool specially designed for the work.

One of the difficulties makers of these devices have had to overcome is to design the tool so that it will not only impart a reciprocating motion, but lift the valve from its seat in the cylinder at stated intervals. With the bit stock or screw driver this is accomplished by placing a spring under the head of the valve.

An automatic valve grinder, which was patterned after the operation of the ordinary carpenter's breast drill, is the invention of R. H. Hazeltine of New York City, and is manufactured by the Specialty Machine Company of 94 Liberty street, of that city. The device, two views of which are presented at Fig. 3, consists of an oscillating arm, a bevel pinion, a driving rod for the valve and two plain gears with a turning crank; also a cam, roller, clutch and spring.

Its construction is best outlined by its operation in service. When the handle A is rotated the crank B revolves in the slot C, imparting a reciprocating motion to the arm and segment D, which also reciprocates the small pinion E, the clutch I transmitting this movement to the driving spindle E. The gear G is driven by the small pinion K. Located on the inside of larger gear is a cam which periodically comes under a roller mounted upon the carrier L, and lifts the clutch I from engagement, but holding it until the pinion E has rotated through a given arc, whereupon the cam drops the clutch back into engagement.

This movement lifts the valve from its seat. A spring M insures the engagement of the clutch at the proper time and supplies the proper pressure. The nut R locks the valve on the rod M. The weight of the tool and the operator's pressure is sustained on the shoulder N and the valve opening on the engine.

The cycle of operations is as follows: First, the valve is reciprocated on its seat for a given number of times, is lifted, released and automat-

ically placed in a different angular position on the seat, then moved forward through a given angle and reciprocated as before.

PREVENTING RUBBER HOSE KINKS.

With the modern automobile the repairman does not experience any difficulty in replacng worn rubber water tubing with new as the connections are usually free from serious bends. On some types of old motors, however, the hose must be carried in such manner that a heavy grade tubing, having thick walls, must be employed else the pipe will kink badly and impede the circulation of water. Fitting the hose is a difficult task and to make the connections watertight is also troublesome.

A light tubing may be employed and in addition to being easier to handle is cheaper. It is interesting to note that the rubber manufacturers are marketing a durable light hose for this work and if it has a tendency to kink it may be prevented by using a coil of spring, wire, a method which is utilized on locomotives.

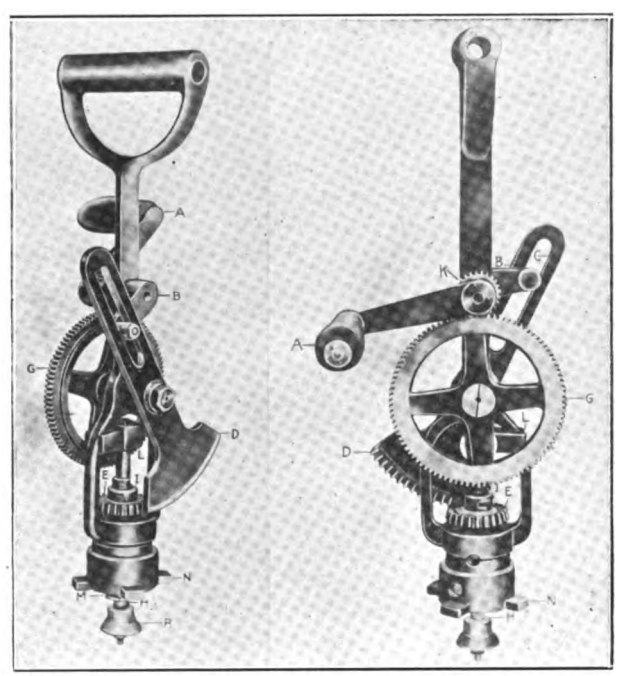
It consists of winding and inserting within the hose the coil of wire which is made in the following manner: Take a piece of round metal, a pipe or iron member, about .25 inch smaller in diameter than the inside diameter of the hose. Cut a small slot in the end of the winding member and in the recess secure one end of the wire then wind it by retaining the rod member in the vise. The rubber tubing is then slipped over the wound spring, the latter released and the rod withdrawn. The coils will expand, filling the hose and will prevent its kinking. The gauge of wire employed should be stiff enough to withstand bending, depending upon the service of the rubber hose.

BENT FAN BLADES CAUSE HEAT.

There are a number of conditions which will cause heating of the motor, but a new one is pointed out by a driver of a commercial car who cares for his own machine. The motor became very warm, especially when operating on the low gear, and thinking perhaps that the pump was not working properly or the water pipes were clogged, these members were examined, but found to be in good condition. Various other inspections were made without discovering the cause of trouble. In lifting the hood the operator noted that the volume of air forced back from the fan was very small and an examination of the fan disclosed the fact that the blades were so bent that they were of little service. The pitch of the vanes was changed and after a little experimenting they performed their work properly and the heating symptoms disappeared.

MAXWELL FOR INDIAN MISSIONARY.

Although far removed from the comforts and luxuries of American home life to which she has been accustomed, Miss S. E. Swezey, M. D., a Presbyterian medical missionary in India, is enjoying a Maxwell runabout, made by the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., which she recently purchased through an auto-



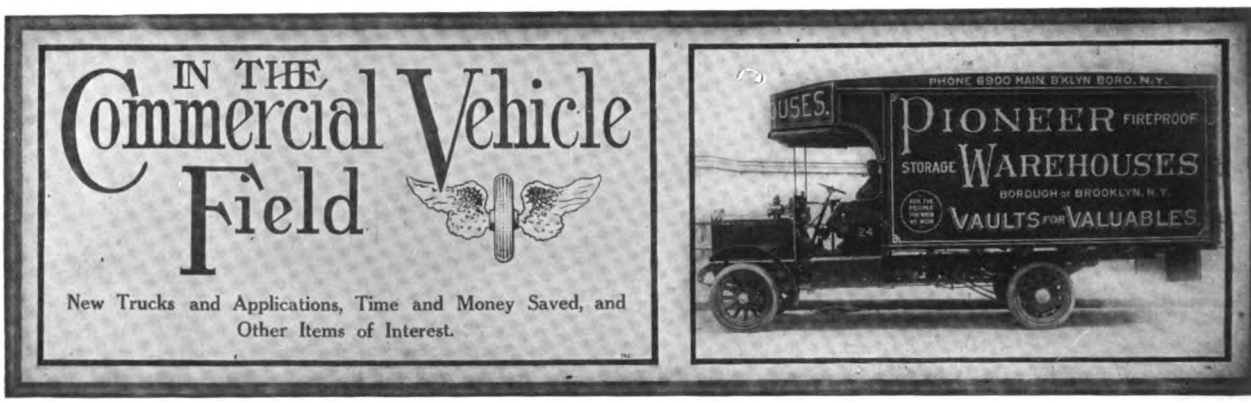


Fig. 3—The Automatic Valve Grinding Tool, a Device Lifting Valve, Also Imparting Reciprocating Movement.

mobile dealer at Calcutta. Dr. Swezey plans to remain in India four years longer and her machine will see considerable service in that time.

NO FENDERS IN OMAHA.

After considering a proposition to compel all automobiles operating within the city limits to be fitted with some type of safety fender, the city commission of Omaha, Neb., has decided to place the matter on file. The ordinance is said to have been introduced by a manufacturer of a certain type of fender.

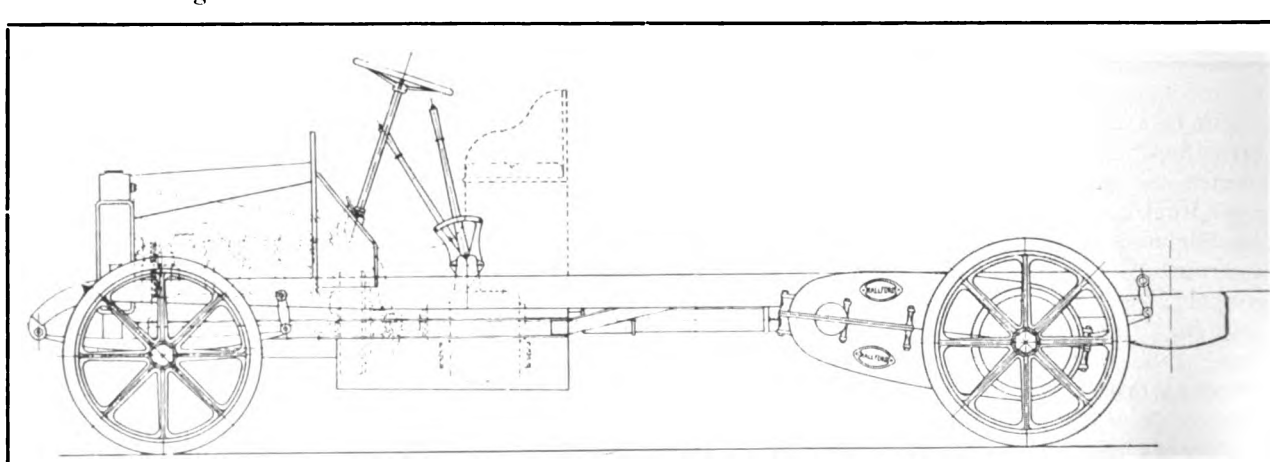
A BRITISH TWO-TON WAGON.

As an indication of the type of vehicle designed by British manufacturers for general service haulage, there is presented herewith a reproduction of the chassis fully equipped with body and a drawing of a side view of the chassis itself. This is a two-ton truck, designed and built by J. & E. Hall, Ltd., Dartford, Kent, a pioneer manufacturer of industrial transports in Great Britain. It is a development based upon the service demanded by its patrons, covering a number of years in experimentation.



The chassis itself is fitted with a 25 horsepower, four-cylinder motor, with crankcase of aluminum. Inlet and exhaust valves are made from nickel steel. The timing gears are entirely enclosed within the oil chamber. Ignition is by Bosch high-tension magneto. Cooling is by water, circulation being maintained by a pump. Power is transmitted by a special form of friction clutch to the four-speed transmission and differential, final drive being by enclosed chain.

Two sets of brakes are fitted, one acting on a drum on the gear shaft and the other on drums in the rear wheel hubs. The frame is of pressed nickel steel. Springs are long and of special resiliency. Wheels are of cast steel, mounted on ball or roller bearings, and the tires are guaranteed by their maker for 10,000 miles.

Besides the body shown, these chassis are equipped with specially designed carriers for contractors, platform work, delivery service, etc. The maker claims for them a simple and efficient method of handling either heavy or light loads, and in this respect the construction of the chassis components is strictly in keeping.

TRUCK REPLACES EIGHT HORSES.

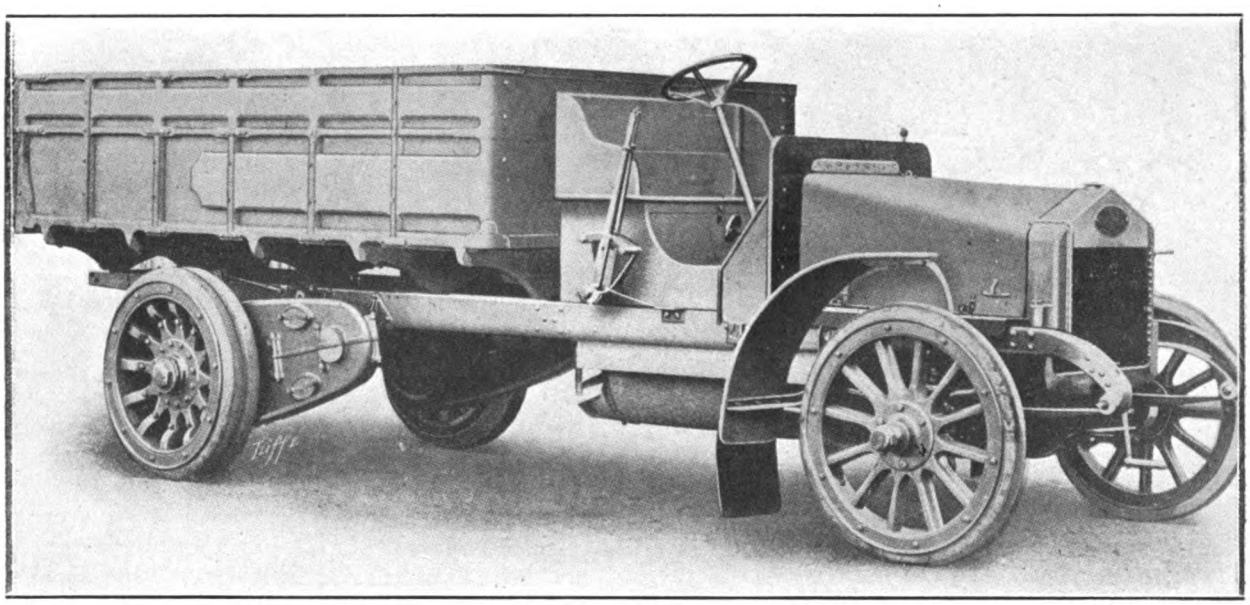
Coal dealers who have large tonnage to deliver to public buildings, institutions and the like, have found large capacity motor trucks with power dumping bodies unusually efficient for their purposes. Recently a five-ton truck equipped with a power dumping body was purchased by the Staples Coal Company of Boston and was almost immediately employed hauling coal from the company's wharf on Albany street to the State House, a distance of little more than a mile.

Side Elevation of Hallford Two-Ton Chassis, Indicating Location of Motor and More Important Components.

Digitized by Google

The machine made 16 trips in a working day, delivering 80 tons of coal. A five-ton load hauled much more slowly would require three horses. Such a team at best could deliver no more than six loads. Thus, the truck replaced eight horses and made the services of two men unnecessary.

PEERLESS IN PORTO RICO.



Sobrinos de Pedro de Diego & Co., of Guayama, Porto Rico, retail dealer in merchandise, rice, beans, sugar, dry goods and liquors, located in the interior of the country where there are no railroads, has replaced its bull carts, with which it formerly delivered goods, with a Peerless truck, made by the Peerless Motor Car Company, whose manufactories are located in Cleveland, O.

In the interior of Porto Rico the company has considerable business, notably in Cayey, a mountain town. The truck makes a trip to Cayey every day and sometimes twice a day. The distance is 27 kilometers or 16 miles from Guayama over a winding mountain road in which there are by actual count 487 sharp turns, and an ascent of 2400 feet in 10 miles. The Peerless truck averages 60 or 70 miles a day and during its first month of service earned a profit of $911 for its owners.

LOCOMOBILE IN ENGINEERING WORK.

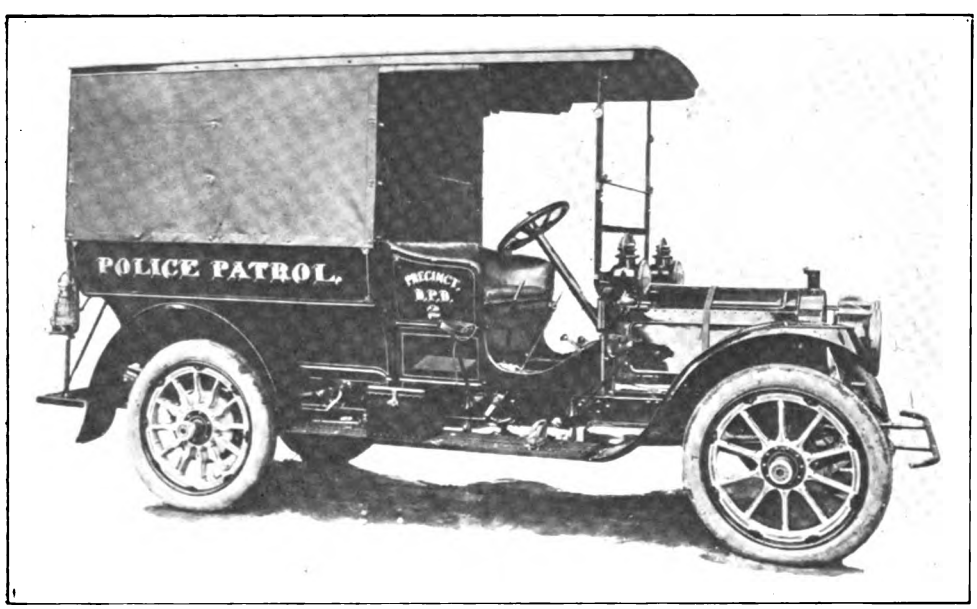
John F. Stevens, an engineer of international repute, the first engineer in charge of the Panama Canal work, recently formed the John F. Stevens Construction Company of New York City, capitalized at $2,000,000, for high grade construction and engineering work. Forming an important part of the equipment of the company is the large capacity five-ton Locomobile truck made by the Locomobile Company of America, Bridgeport, Conn.

This was the first vehicle produced after the special machinery had been installed in the new commercial car plant of the company. The chassis was fitted with special type of dumping body, which, according to the heavy and severe work the truck is called upon to perform, was made of unusual strength. It has been put in service in central New York, where it has been used for hauling heavy materials to the site of a large dam the Stevens company is building, and remote from any of the branches of the Locomobile company.

Two-Ton Hallford Chassis of British Manufacture, Fitted with General Service Wagon Body.

GARFORDS IN GROCERY DELIVERY.

James Butler, large wholesale and retail grocer in New York City, has a fleet of 16 Garford trucks, made by the Garford Company, Elyria, O., which is divided between five five-ton wagons, 11 of one ton capacity and one carrying 1000 pounds. The service obtained from these has been decidedly satisfactory in every respect.



The five-ton trucks are employed to deliver goods from the wholesale warehouse to the retail stores in Tarrytown, White Plains, Port Ches-

Digitized by Google

ter, Hempstead, etc. The smaller wagons are utilized for route deliveries from the retail stores. Mr. Butler says it would be impossible to accomplish the work done with these vehicles by depending upon horses.

TRUCKS FOR PARCELS POST.

A recent conference of the leading postmasters of the larger cities with the postmaster-general at Washington relative to preparations for putting into operation the parcels post was a matter of more than ordinary interest to motor truck manufacturers. It suggests that within a very short time the government may be in the market for the largest installation of motor trucks ever ordered by one buyer and if it is, may want thousands of them delivered at a rate that will tax the capacity of the industry.

Patrol Wagon Fitted to Packard Chassis for Detroit Police Department.

The postal authorities realize that a parcels post on paper and in actual operation is a radically different thing and if any considerable portion of the parcel carrying business suggested as likely to be turned over to the government materializes, the department will be confronted with the biggest transportation problem ever created. The department is said to be loath to turn the work over to contractors, therefore there may be a sudden demand for thousands of motor trucks for almost immediate delivery. The startling feature of this to manufacturers is the likelihood of being confronted with it before the first of the year. Some of them are laying plans to ascertain the government's needs in order to be in a position to meet the sudden demand.

INTERESTING PATROL BODY.

That there is a growing demand for special kinds of commercial car bodies for various classes of service will be conceded and the Motor Truck Body Company of Detroit, which has been successfully manufacturing bodies for all types of motor trucks, has turned its attention quite as successfully to municipal service vehicles. An example of the work of this company is shown in an accompanying illustration, which presents a police patrol wagon in service with the city of Detroit. The body is fitted to a 30 horsepower Packard chassis. It is of the enclosed type and so built as to provide seats for a driver and one man entirely separate from the main portion, which has accommodations for eight or more persons.

In addition, provision is made for carrying an ambulance stretcher, so the machine answers all the requirements of police work. Heavy wire screens, securely fastened, enclose the main portion of the body and there is an opening at the rear sufficiently large for easy passage. The sides and rear are fitted with rolling curtains of water proof material, stretched over the wire screen, thus protecting the occupants from public view. Hand rails of polished brass at the rear entrance add to the attractiveness of the vehicle and an electric light, protected by a heavy glass globe is supported on the inside of the roof. A suitable storage battery furnishes the power for the light. Side curtains thoroughly protect the driver from weather conditions and an adjustable windshield is constructed in such a manner that a full view of the road may be obtained during rain or snow. The workmanship and material is of the very best throughout, and there is every reason for believing that this product will make a decided appeal to cities interested in motor equipment installation.

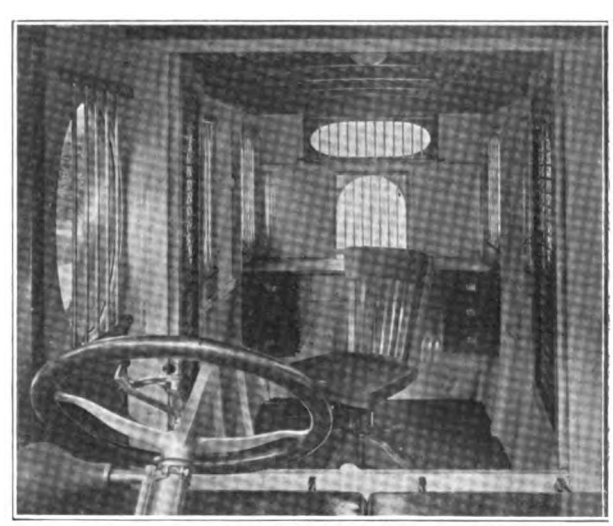
LARGE ORDER FOR EXPRESS COMPANY.

The Wells Fargo Express Company has taken a step that is significant in the solution of the

One-Ton G. V. in Service with Pacific Mills, Lawrence, Mass.

transportation problem by recently placing an order for 34 motor trucks of various makes, having two and three tons capacity. The trucks purchased will be utilized in place of the horse drawn wagons attached to the company's offices in New York City, Chicago, St. Louis and San Francisco.

The Wells Fargo officials deny the original report that they had placed an order for 100 vehicles with one company and they also state that the company is not at present in the market for more machines. It is officially stated that the order includes nine G. V.'s made by the General Vehicle Company, Long Island City, L. I.; six Alcos, made by the American Locomotive Company, New York City; five Macks, made by the International Motor Company, Allentown, Penn.; five Peerless, made by the Peerless Motor Car Company, Cleveland, O.; five Packards, made by the Packard Motor Car Company, Detroit, and four Whites, made by the White Company, Cleveland, O.



ELECTRICS IN TEXTILE SERVICE.

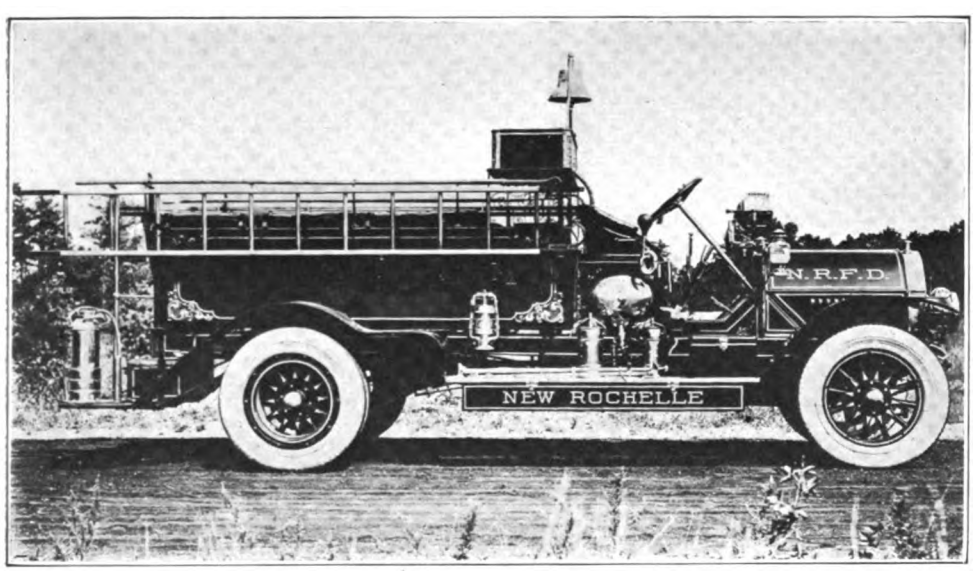
Many textile manufacturers, who for years denied the practicability of introducing motor trucks in their transportation departments, have been convinced that this method of hauling their products to and from their mills is the most economical and efficient that can be devised and they have gradually motorized their equipment, disposing of their horse drawn vehicles. It is a striking coincidence that of the large number of textile concerns which have adopted the motor vehicle, many have utilized the electric truck in preference to the gasoline commercial wagon. This is due in most instances to the fact that the textile mills are lighted by electricity generated in the plants, so that charging the electric trucks is accomplished with the least possible cost, since the electricity does not have to be purchased of a power concern.

An accompanying illustration shows a one-ton G. V. wagon made by the General Vehicle Company, Long Island City, L. I., in use by the Pacific Mills, Lawrence, Mass. This company has four other electric trucks of the same make and has ordered a sixth of similar capacity. Some of these have been in use for six years and although the hauls are short, the work is being accomplished at a cost 80 per cent. of that for horses. The company has erected a fine garage and maintains a first class repair shop in connection with it. By a system of accounting for the time of service by the trucks and drivers the company has placed its department upon a high basis of efficiency.

CARTERCAR BANK ON WHEELS.

What is considered a decided innovation in the matter of transporting large sums of money through city streets has been inaugurated by the city of Detroit, with the assistance of the Cartercar Company, Pontiac, Mich., which designed a

Interior of Cartercar, Equipped for City Paymaster in Detroit.



veritable bank on wheels to conform to the ideas advanced by the city treasurer.

Previously the city payrolls were distributed by policemen on foot and many holdups occurred,

Digitized by Google

with attendant loss of funds. So frequent had these robberies become that it was found necessary to change the method of service. The police department had experienced success with Cartercar friction driven machines, so the Cartercar officials were given a contract to construct a specially designed body, an interior view of which is shown herewith.

The chassis is the regulation Cartercar model. Every modern convenience is incorporated, so that the paymaster practically transfers his office temporarily from the city hall to the motor vehicle. The office is securely locked and steel bars protect the windows and doors. Even if it were possible for thieves to overcome the driver, it would be next to impossible to reach the paymaster, who would be able to protect himself and the cash from any outside interference, until an alarm could be given and help secured.

Knox Combination Chemical Engine and Hose Wagon in New Rochelle, N. Y.

SUGGESTS CO-OPERATIVE PLAN.

R. W. Hutchinson, Jr., of New York City, advances a suggestion that is new, but which might receive consideration from merchants all over the country. He states that if the smaller merchants could unite and co-operate in the matter of delivery by using the same motor vehicles they could create decided economy and place themselves in a position to compete more successfully with their strongest opponents in business.

Mr. Hutchinson contends that many small merchants are obliged to maintain a horse vehicle at large expense to deliver goods of relatively small value to remote districts. Goods thus delivered at a loss must be equalized in some manner and oftentimes this cost, necessary to retain custom, is figured into the selling price of some other commodity. A number of small merchants, whose combined delivery work with motor trucks would require only three or four, could partially cover distribution expense with greater profit by paying a pro rata share of the operating cost of the truck, which could carry its full rated load, instead of each individual maintaining a small wagon at a comparatively inordinate expense.

KNOX EQUIPMENT IN NEW ROCHELLE.

Two pieces of motor fire apparatus, made by the Knox Automobile Company, Springfield, Mass., have been put in service by the city of New Rochelle, N. Y. The vehicle shown in the accompanying illustration is a combination chemical engine and hose wagon, while the other is a so-called flying squadron car. The combination machine is equipped with one 40-gallon chemical tank, located under the driver's seat and a type C body, having capacity of 1200 feet of 2.5-inch water hose and a crew of 10 men.

The chassis is known as model R-33 and is equipped with a 40 horsepower, four-cylinder motor, especially heavy three-speed transmission and chain drive to the rear axle. The body is arranged with lockers on each side in which the men carry their special fire clothing, enabling them to change their garments while on the way to the scene of the blaze. The rest of the equipment consists of baskets for chemical hose, hand extinguishers, ladders, fire bell, siren horn, searchlight on the dash and a full complement of fire tools.

The Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, has leased 13,000 feet of space in the Industrial building pending the occupancy of an addition to its factory.

Dash Adjustment of Carburetor.

(1448)—I find it necessary to change from time to time the air adjustment of my carburetor. In order to do this I have to lift the hood to get at the adjustments. I note that a number of cars have devices upon the dash for changing the mixture for starting, etc., such as the Ford. Could I not fit one of these and what is the best method to use? CONSTANT READER.

Canton, O., Oct. 31.

The equipment and installation would depend upon the type of carburetor employed, which is not stated in the communication. Some dashboard devices for adjusting the vaporizer permit of variation of the fuel while others control the air valve. On the Ford machine the needle valve is actuated by a knurled screw member on the dash while on other types the volume of air is regulated.

At Fig. 1 is presented two methods, that at B being employed with the Rayfield carburetor. The control lever is mounted upon the dash and the plate supporting the arm is marked with the letters L and R, denoting lean or rich mixtures. When the lever is moved either way the mixture is changed, according to the position of the arm. The latter actuates the adjusting device of the carburetor through rods and a bell crank.

At A is illustrated a method of utilizing Bowden cable. This is enclosed in a tube and the dash end secured to a plunger. When the latter is moved in or out of its housing the movement operates the adjusting mechanism of the carburetor. Bowden cable is particularly adapted for this work as it not only may be employed where bends cannot be avoided, but it will withstand severe stresses. It should be enclosed in a flexible tubing for protection.

Picric Acid in Fuel.

(1449)—Will you inform me how to properly use picric acid with gasoline for racing purposes? W. F. B.

Meriden, Conn., Oct. 26.

The best results are obtained by the use of one ounce of picric acid (ammonia nitrate) and two ounces of sal ammoniac to five gallons of gasoline. Another formula is: Eight ounces of sulphuric ether to five gallons of gasoline. It is well to observe extreme caution in employing ingredients of this nature as the power of the explosion is considerably augmented and the motor may be severely tested by its use. There is also danger in handling the substance and its use is not recommended.

Priming Device.

(1450)—I have a car the motor of which does not lend itself readily to the fitting of priming cocks and as it would cost quite a sum to install these would like to know if there is any way a priming system can be fitted. A friend of mine stated that he read in your magazine an account of how to install a priming outfit and that it was not very expensive. OWNER.

Concord, N. H., Nov. 1.

Several priming devices have been described in these columns during the past year and in the present issue in the department entitled "New and Novel Accessories," will be found a description of a priming device recently placed upon the market.

One may be constructed, however, and at Fig. 2 is illustrated a simple device which may

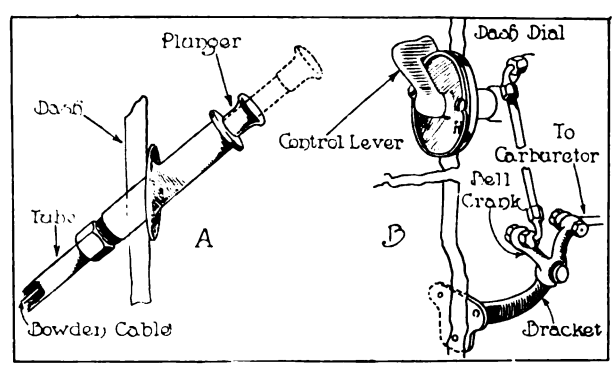

Fig. 1—Illustrating Dashboard Devices for Changing Mixture of Carburetor: A, Bowden Cable Actuated by Plunger; B, the Rayfield.

be installed at a slight expense as the material is not costly. The principle involved is that of priming the intake manifold and conveying an enriched mixture to the cylinders.

The material required includes a suitable container for the fuel, a petcock or shut-off valve, two connectors, having a pipe thread at one end and a tubing connection at the other, and copper tubing. If desired the connector utilized with the fuel tank could be eliminated and the tubing soldered.

The size of the tank would depend upon available space and location. One holding a quart would serve and an ordinary square can could be employed and made gas tight by soldering the seams. It could be attached to the dash inside

Digitized by Google

the hood by metal straps or in any other convenient manner; and care should be taken to provide the filler cap with a vent, else the fuel will not flow.

One end of the copper tubing is secured to the bottom of the fuel tank and the other fitted to the intake manifold by drilling and tapping a hole to take the connector. Incorporated in the line is the petcock, as shown in the sketch.

To use the device the petcock is opened and a small quantity of gasoline allowed to flow to the walls of the intake manifold where it is converted into vapor when the motor is cranked. A high grade gasoline, 74 or 76 test, could be employed in the tank, and it would make starting much easier than with the standard fuel now being marketed for motor cars. If ordinary gasoline be utilized it could be mixed with ether, using about

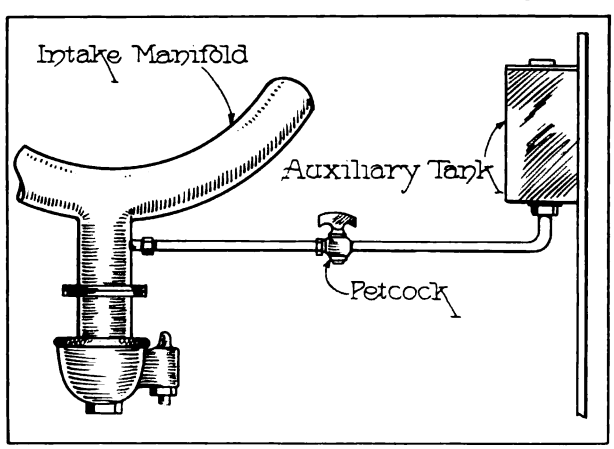

Fig. 2—An Easily Constructed Priming Device for Facilitating the Starting of the Motor.

one ounce to the gallon. Such a mixture would cause the fuel to vaporize easily.

Timing K-W and Remy Magnetos.

(1451)—Will you kindly give me the correct method of timing the K-W and Remy magnetos? Do you set the inductors about .0625 inch from the pole pieces as you do a Splitdorf or Bosch, or adjust the cams so that the points begin to separate and the brush just touching the segment? H. W. P.

San Francisco, Cal., Oct. 22.

The timing of the Remy magnetos is by the break of the contact points, which are separated by the cam. The piston of the cylinder to fire should be placed upon exact dead firing centre and the cam housing should be in a fully retarded position. The platinum points are just separating, but not touching. There is but one adjustment, that of the contact screw, and this should be so set that the maximum break of the points is between .025 and .03 inch.

If the motor misses with the spark retarded, and shows indications of skipping more at low than at high speeds, the contact screw should be screwed out a notch at a time until the trouble is overcome. If the engine misses with spark advanced, the contact screw should be screwed in a notch at a time until the motor runs evenly at high speeds.

The K-W true high-tension types of magnetos are timed easily, the operation being similar to the instrument just described. The firing point is when the platinum contact points of the circuit breaker are just beginning to break apart, not when they touch. The location or position of the distributing brush is similar to other types of magnetos.

Master Vibrators and High-Tension Coils.

(1452)—Will you kindly answer in your columns the benefit derived from the use of a master vibrator? I have consulted several owners who have used this apparatus, some with fine results and others who have discarded it entirely and gone back to their old vibrator coils. In your issue of June 10th I noticed a sketch outlining the action of a high-tension coil, in which the secondary winding is composed of three conductors, one of which runs in the opposite direction. Will you give me the reason for the coil being wound in this manner? W. A. H.

Dalton, Mass., Oct. 26.

The benefits derived from a master vibrator are numerous and if one does not give excellent service it is because it is not properly installed or because the adjustment has been tampered with by one unfamiliar with its operation. The vibrators are adjusted properly when they leave the factory and will not require attention for some time.

One of the more important advantages of the master vibrator is that synchronization of the spark is obtained. While it is admitted that a four-cylinder coil when new and properly adjusted will give good results, it should be borne in mind that in time the vibrators lose their elasticity, and that it is possible that one or more may vary in this respect from the others. With an engine making 1500 revolutions a minute, for example, it is obvious that the slightest difference in the timing of the spark will have its effect upon its operation; that is, one cylinder might fire slightly later or earlier than it should.

Synchronization means that every cylinder fires its charge in exactly the same angular position of the crankshaft, thus producing an even torque. The spark produced by a master vibrator is similar in each cylinder for the reason that one vibrator performs the function of breaking the primary circuit, and irrespective of the adjustment of the vibrator the spark developed by the windings will be the same. If the vibrators of a four-cylinder coil are adjusted differently, it follows that the intensity of the flame will be va-

Digitized by Google

ried. If three units are productive of a hot or large spark at the plug and remaining unit is improperly adjusted, the spark in that cylinder will be weak and part of the charge will pass out unburned, or in other words, that cylinder will not develop its maximum efficiency and the motor will operate erratically.

It is possible that the trouble mentioned may be due to improper adjustment of the vibrator and in setting the latter the instructions of the maker should be followed. If properly installed there is no reason why a master vibrator should not give efficient service. The writer personally knows of a large number of these devices in use which have given perfect satisfaction.

The construction, operation and windings of an induction coil are as follows: A core composed of a number of lengths of soft iron wire around which is wound the primary coil, the latter consisting of a few turns of coarse copper wire, Nos. 14-18 B. & S. gauge being commonly used. This coil is well insulated from the secondary coil, which is composed of a great number of turns, many thousands in fact, of very fine insulated copper wire, varying in size, Nos. 34-38 B. & S. gauge.

The vibrator interrupts and re-establishes the primary circuit and when the contact points are together the circuit is closed. The making and breaking of the primary circuit generates a very high electromotive force in the secondary winding by induction. A condenser is used, being connected in parallel with the vibrator, and is employed to absorb the spark generated between the points of the make and break device because of the extra current produced in the primary coil by self-induction. It may also be said to act as a storehouse for the extra current induced in the primary by its own coils of wire acting upon each other by the magnetism of the core and by the back inductive influence of the secondary coil.

The making and breaking of the primary is accomplished by the timer or commutator in the primary circuit. One lead from the battery is connected to the spring of the vibrator, and the other lead from the battery is grounded through the timer. The primary winding is also grounded at one end, and connected at the other with the vibrator screw. Closing the contact at the timer completes the primary circuit, the current flowing from the battery to the trembler, through the spring and platinum point, thence through screw and primary winding to the ground. The passage of the current magnetizes the soft iron core, so that it draws the trembler weight down to it through the flexibility of the spring, and breaks the circuit at a predetermined time.

At the instant of the break the secondary current is built up to a very high point, and flows through its circuit in which is placed the spark plug. When the flow of the primary current is interrupted the core ceases to be a magnet and the spring of the vibrator mechanism draws it back to its normal position, making contact between the platinum points and re-establishing the primary circuit.

The secondary or induced current is developed by means of the series of fine windings and the core. The current induced in the secondary circuit by closing the primary circuit is opposite in direction to that of the primary current and that induced in the secondary coil by interrupting the primary circuit is in the same direction. The induced currents are only caused when the strength of the magnetic field surrounding the primary winding is changed, therefore if a constant current were passing in the primary circuit there would be no current induced in the secondary because the magnetic field would always be of the same strength. It is only when the strength is changed that the secondary current is induced, and the strength of these induced currents will also depend upon the abruptness of the changing of the primary current and their direction will depend upon whether the primary current increases or decreases.

In the commercial type of induction coil, such as utilized for ignition purposes, the connections of the secondary and primary leads, which are joined together, are made inside the coil. In the box type of coils, one primary and one secondary are coupled on the outside of the coil box, terminals being provided for this purpose.

The wiring of the high-tension coil in practise involves grounding one lead of the battery to the frame, the other wire being led to the switch of the coil. The primary coil circuit is established through the timer, which is grounded by a wire from its terminal to the primary post of the coil. The secondary circuit is grounded through the metal shell of the spark plug.

A new time record for the run from Seattle, Wash., to Vancouver, B. C., has been made, according to a telegram received by the American Motors Company, Indianapolis, Ind., from Marc Bunnell, district sales manager of the Pacific Coast territory. An American underslung car made the 200-mile journey over some exceptionally bad roads, in 7.5 hours, lowering the previous record by nearly an hour. The car stood the trip splendidly, according to the message.

BRITISH HORSEPOWER FORMULA.

The British committee appointed Dec. 6, 1911, for the purpose of determining whether or not the present method of taxation on motor cars in Great Britain was fair and equitable, has made its report. The investigation involved the problem of horsepower rating, and for a time there was indication that the formula of the Royal Automobile Club, which is the same as that adopted by the Association of Licensed Automobile Manufacturers in this country, and later by the Society of Automobile Engineers, would be superseded by some other.

The substance of the recommendations made by the committee is most conveniently summarized in the form of the following regulations for the determination of horsepower, which will take the place of the provisional regulations now in force in England:

1—For the purpose of these regulations the horsepower of any motor car deriving its motive power wholly from an internal combustion engine worked by a cylinder or cylinders shall be taken to be: (a) In the case of a single-cylinder engine the horsepower attributed to the cylinder of the engine; (b) in the case of an engine having two or more cylinders the sum of the horsepowers attributable to the separate cylinders.

2—The horsepower attributable to any cylinder of an internal combustion engine shall be deemed to be equal to the square of the internal diameter of such cylinder measured in inches divided by a numeral: (a) In the case of a single acting cylinder having a single piston, the numeral used as divisor shall be 2.5; (b) in the case of a single acting cylinder having two pistons, the numeral used as divisor shall be 1.6.

3—The horsepower of any motor car deriving its power wholly from a steam engine shall be taken to be proportional to the effective heating surface of the boiler supplying steam to such engine, at the rate of one horsepower for every three square feet in such effective heating surface and the effective heating surface shall be taken to be: (a) In the case of a boiler having horizontal or approximately horizontal tubes, the whole of the surface of the tubes which is exposed to the flame or hot gases; (b) in the case of a boiler having vertical or approximately vertical tubes, half of that surface which is exposed to the flame or hot gases.

4—Any motor car deriving its motive power from an electric motor or motors shall be deemed to be of a horsepower exceeding 6.5, but not exceeding 12.

5—In measuring cylinders and boilers, and in calculating horsepower, fractions of inches and feet, and fractions of a unit of horsepower are to be taken into account.

6—Where it appears that in consequence of the exceptional design or construction of the engine of any motor car the horsepower as calculated under the preceding rules is substantially less than the average power which the engine would develop in continuous use on the road if there were no restrictions on speed, other than imposed by the car itself, then such average power shall be taken as the power.

These recommendations have been accepted by the treasury and new regulations are being prepared to go into effect Jan. 1. The report is of decided interest in this country, because of the fact that many states already tax automobiles under the S. A. E. formula, and because it now becomes even more authoritative as having been officially adopted by the British government.

RICHMOND CASES DISMISSED.

Four motor car sales companies were brought before the police court in Richmond, Va., recently for violation of the motoring law, because vehicles owned by them were being operated without license. After investigating the situation City Attorney Anderson recommended that the cases be dismissed. It was found that the vehicles in question were loaned to local merchants for demonstration purposes. In asking for dismissal, the city attorney stated as his opinion that the person to whom the vehicle was loaned should secure the license.

CHICAGO'S AUTOMOBILE COURT.

The special court for handling automobile cases which was inaugurated in Chicago, Jan. 1, 1911, has now worked out a card system for speed violators and others, so that it is possible to determine at once whether or not the alleged offender has been before the court previously on a

Digitized by Google

similar charge. The system is said to operate in a satisfactory manner, and that the number of violations in that city has been decidedly less since the special court was established.

WILL HELP LOCAL OFFICERS.

The Automobile Club of Utah has notified Chief of Police B. F. Grant of Salt Lake City, that it will aid him in the enforcement of the local traffic ordinances, and has addressed an open letter to the public, in which it is set forth that the club intends to see that the owners and drivers of all vehicles shall comply with the law. Special reference is made to the practise of vehicles in passing street cars about to stop to take on or discharge passengers, driving side by side on the city streets and obstructing crosswalks, etc.

DRIVING LICENSES IN MARYLAND.

According to an opinion handed down by Judge Duncan of the circuit court in Baltimore county, Maryland, in a test case brought by the Automobile Club of Maryland, persons under 18 years of age, who obtained licenses to operate automobiles under previous acts of the legislature, cannot be prohibited from operating cars under the provisions of the act of 1912. The rest of the law is held valid by Judge Duncan, and hereafter it will be unlawful for any person under 18 years of age to operate an automobile in Maryland, unless the operator's license was procured before April 4, 1912. Commissioner of Motor Vehicles Roe declares he is going to see that the law is obeyed in every detail, declaring that every violator will be punished. The penalty is $10 for the first offense, $25 for the second and $100 or 30 days in jail for all subsequent violations.

WANT STATE MOTOR POLICE.

A movement has been started in Connecticut, which will be watched with interest by motorists throughout the country. Petitions are being circulated among automobile owners, asking that the legislature create a suitable number of state motor police officers who shall have charge of the violations of the motoring laws. It is maintained that the local police fail to do their duty in this respect through fear of the influence exerted by prominent people on city officials. The petitions are to be presented to the governor in time for insertion in his inaugural message to the incoming legislature.

NO EVADING FARES IN RHODE ISLAND.

Because the operators of taxicab companies in Rhode Island have discovered no way in which to protect themselves against the failure of transients to pay their fares, a bill will be introduced into the forthcoming legislature covering this matter. It is stated that a common method of evading fare is to engage a cab to carry the party, say from one hotel to another. Upon reaching the second hotel, the fare asks the driver to wait a moment while he steps inside, and makes his escape through another door. The proposed bill will make it a criminal offense to evade a taxicab fare.

LEGAL TAXICAB FARES.

A recent investigation of the legal taxicab fares obtaining in several large cities of this country and abroad shows a decided lack of uniformity and undoubtedly will prove of interest. In this connection, it also was found that the dead mileage in London averages 25 per cent. of the fares, in Berlin 27 per cent., and in New York 65. The tabulation of fares follows:

Leading American Cities.

City	Initial Charge	Distance	Subsequent Charge	Distance
New York	$1.00	one mile	$0.50	half-mile
Boston	.40	half-mile	.10	half-mile
Chicago	.50	half-mile	.10	quarter-mile
Philadelphia	.75	one mile	.50	one mile
Washington	.50	half-mile	.10	quarter-mile
Baltimore	.50	half-mile	.10	quarter-mile
Pittsburg	.50	half-mile	.10	quarter-mile
Principal Foreign Cities.				
Berlin	.16	start	.0250	fifth-mile
Paris	.19	start	.0975	third-mile
London	.15	half-mile	.0200	fifth-mile
Dresden	.16	start	.0250	fifth-mile
Vienna	.16	start	.0250	fifth-mile
Naples	.16	start	.0250	fifth-mile

WOULD AMEND LIGHTING LAW

The present universal lighting law in Massachusetts was approved in June, 1911, and has been in force something over a year. Its operation has indicated the desirability of compelling all vehicles using the highways during the hours of darkness to be equipped with lights, but the law contains a clause which exempts all except automobiles where street lights are maintained at a distance of 500 feet apart or less. Several accidents have occurred on parkways, boulevards, etc., where street lights are thus maintained, and it is proposed to eliminate this clause. The matter will come before the legislature in the form of an amendment to the present law.

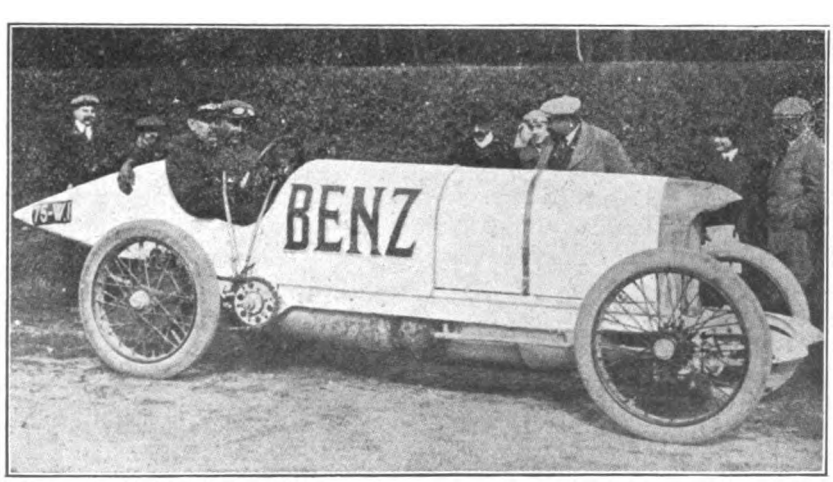
A Sunbeam car, of British make, recently created new world's records on the Brooklands track, Weybridge, England, reducing the marks previously held by the Vauxhall and Straker-Squire in the 16 horsepower class. For the purpose of comparison the new and old figures are presented in the following tabulation:

	New Records		Old Records		
Distance	Time	MPH	Time	MPH	Held by
Half mile	0:17.67	101.87	0:18.43	97.67	Vauxhall
Kilometer	0:22.16	100.95	0:23.14	96.67	Straker-Squire
One mile	0:36.20	99.45	0:37.93	94.91	Straker-Squire
25 miles	17:42.51	93.75	18:09.11	91.46	Vauxhall

★

At the recent 14th annual competition on the famous Gaillon hill, France, a long slope between Vernon and Rouen on the Grande Route from Paris to Dieppe, Erle, an American racing pilot, driving a 200 horsepower Benz machine, won first in the Class 1 event, establishing a new record for the course, which he covered in 0:22, representing a speed of over 101 miles an hour. The machine and its driver are shown in an accompanying illustration. In Class 7 Pouget driving a Buick, an American machine made by the Buick Motor Company, Flint, Mich., won first, his time being 0:45.6. The list of class winners follows:

Class	Car	Driver	Time
1	Benz	Erle	0:22.0
2	Gregoire	Casta	0:37.0
4	S. P. A	.....	1:02.6
5	Anasagasti	Guyot	0:37.0
6	Crespelle	Crespelle	0:36.0
7	Buick	Pouget	0:45.6
11	Bugatti	Touello	0:53.4



★

According to news received from England, the demand for American automobiles in London is increasing so rapidly that the Ford Motor Company, Detroit, Mich., maker of Ford cars, is extending its English works at Trafford Park, Manchester. It is said that English manufacturers intend to reduce prices to meet this competition.

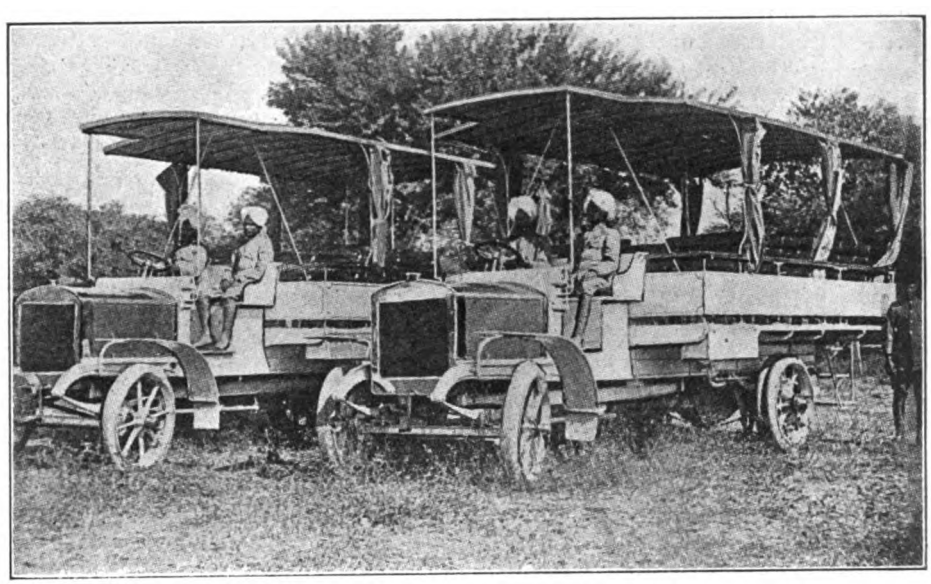
★

The fourth International Automobile Exposition, to be held in Russia next year will be held under the direction of the Emperer in the Mihailovsky Manege, the largest exposition building in St. Petersburg, May 20-June 3. Nominally it will last but two weeks, but may be extended if the committee in charge finds it desirable.

In a special circular American manufacturers are particularly invited to participate because their products are not sufficiently known in that country and because it is believed that the conditions of the market in Russia demand much the same kind of car as is manufactured for American roads. Twenty-two separate classes of automobiles are distinguished as desired for exhibition by military authorities.

Erle, an American Driver, at the Wheel of the Benz Which Made Fastest Time at Recent Gaillon Hill Climb in France.

Digitized by Google



Applications for space and for copies of the rules and regulations governing the exhibition should be made to the Imperial Automobile Club of Russia, 10 Palace Quay, St. Petersburg.

—— ★ ——

A syndicate has taken over the stock of Aktiebolaget Scania-Vabis, which manufactures automobiles and accessories, with principal offices and shops at Malmo, Sweden, at 120 per share, and the capital stock of the company is to be increased from $197,000 to $241,200.

—— ★ ——

An accompanying illustration presents two of the Tilling-Stevens gasoline-electric omnibuses produced by Tilling et Stevens in France and utilized in British India. They are similar in most respects to those of the same makes which have been used with such success in London, with the exception of the body equipment. The London vehicles are of the enclosed type, while the Indian cars have seating capacity for 34 persons, arranged as shown.

Two Tilling-Stevens Gasoline-Electric Omnibuses in Service in British India.

The gasoline motor is a four-cylinder unit, with bore of 4.13 inches and stroke of 4.92. Cooling is by water, circulated by pump. Ignition is by true high-tension magneto. The electric motor is designed to deliver from one to 25 kilowatts at a speed varying from 350 to 1400 revolutions a minute, the control being by levers located within easy access of the driver.

It is maintained that the equipment is exceedingly simple in operation, and that it has demonstrated its thorough practicability in the hands of the natives. There seems to be every reason for believing that this type of conveyance will meet with decided success in this field.

—— ★ ——

The firm of Adam Opel, at Russelsheim, near Frankfort, Prussia, which employs over 4000 workmen and 200 clerks, has decided not to rebuild its sewing machine works, which were burned last year, but will confine its activities to the manufacture of bicycles and motor cars, of which about 4500 of the latter will be built the coming year. The Opel works have also taken up the manufacture of automobile fire engines, motor plows and motors for airships and flying machines. The Adler-Werke (Eagle Works) at Frankfort which began with a small business in 1880 now has an annual production of approximately $4,500,000 and employs 5000 operatives and 500 clerks. In addition to its other lines the firm makes motor cars and automobile fire engines.

—— ★ ——

The Board of Control of Montreal, Can., has resolved to accede to the request of the three section superintendents of the roads department to supply them with small motor cars costing $2000 each. It was explained that the wide extent of territory which had to be covered by the officials rendered the use of automobiles necessary. The annexation of the new wards, which now embrace nearly half the island of Montreal, has increased the work of the superintendents to such extent that it was impossible to cover their districts adequately by the use of horse drawn vehicles.

—— ★ ——

A Buick machine, made by the Buick Motor Company, Flint, Mich., under the designation of Bedford-Buick, the English model of this popular car, recently won the Russian Imperial reliability trials over the barren, icy stretches of Russia's steppes, and also first prize for the flying kilometer race at St. Petersburg. The following day it duplicated that performance at Riga. On the ninth day at Kieff, the hill climbing took place,

Digitized by Google

the Bedford-Buick being an easy victor in this contest. While the numerous competitors were compelled to withdraw one by one through broken wheels, springs and frames, the Buick continued along with no trouble of any kind. The car was driven by J. Petit, a Texas driver, and the famous gold pokal was awarded by Grand Duke Michael Alexandrovitch. This cup, which is 25 inches high and 32 inches in circumference, is fashioned from solid gold and weighs 2780 pennyweight, making it one of the most valuable trophies in all Europe.

★

The increase in American automobile exports as reported by the government each month, over the corresponding month in 1911 continues to be strikingly marked, while the imports of foreign machines into this country show a decrease. This proves that the American trade abroad is growing, while the merits of the home product is realized at home as well. Following are the export and import records for the month of August:

Exports.

	1911		1912	
	No.	Value	No.	Value

R. Dreyman of Dusseldorf, Germany, has secured the agency for the Packard pleasure cars and trucks, made by the Packard Motor Car Company, Detroit, Mich., his territory including the whole German Empire. It is his purpose to push the American car aggressively and he will establish several branches for the distribution and care of Packard cars. The Packard company several years ago established a service station at Paris, France, and so popular did it become that a demand for the cars was created, which has resulted in the addition of a sales department in that city.

★

The value of the automobiles and automobile accessories exported from Turin, Italy, to the United States during 1911 amounted to $186,746, as against $295,013 in 1910. Notwithstanding the decrease in exportation to this country, the year in Italy was an exceedingly prosperous one for the industry. No labor troubles occurred, two new automobile companies were formed and began building cars, and three leading automobile companies bought out or built coach making establishments. Large companies built more motor trucks than ever before, 100 of these being ordered by the government for use in war. The estimate of the automobiles built at Turin during 1911 set the number at 4235, against 3907 in 1910.

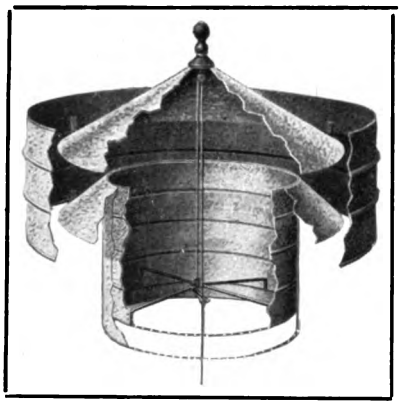
★

The Studebaker Corporation of England, Ltd., has completed the first year of its existence. During this year it is said that the branch distributed virtually as many Studebaker cars, made by the Studebaker Corporation, Detroit, as were sold in England by any British manufacturers.

★

The following communication has been received from the director of the All-Russian Trades and Industrial Exhibition to be held next year at Moscow, in which an invitation to participate has been extended to American manufacturers and exporters:

"The present is to draw your kind attention to the All-Russian commercial and industrial exhibition which is to be held in Moscow from June to about December, 1913. This enterprise, which it is contemplated to give the character of a jubilee exhibition, is being held under the auspices of the administration of the Artisans' Society for Mutual Assistance, and is under the control of the Ministry of Trade and Industry. The ground, which the city of Moscow has placed free of charge at the disposal of the committee for this exhibition, is situated on the Khodinskoe Polie and covers about 72,000 square meters (775,000 square feet).



★

The manufacture of vehicles is carried on mainly in the Cape province and the Transvaal, South Africa, where, it is stated, 1500 skilled white workmen are employed. In these provinces wages represent 36 to 37 per cent. of the value of the output and in the Transvaal and Orange Free State, 50 per cent. The tariff commission has recommended that the chassis for motor cars and motor wagons should be admitted at a nominal duty in order to encourage the building of motor bodies in the country, as the use of horse drawn vehicles is declining in favor of the motor cars and trucks.

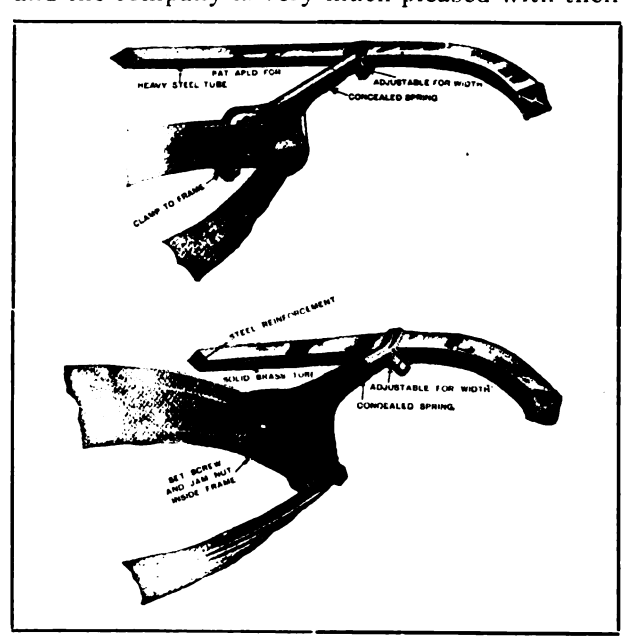
VENTILATING THE GARAGE.

While the modern garage and repair shop are equipped with means for ventilation there are many old buildings which have been converted into automobile stations. With these it is a difficult matter to get rid of the smoke and fumes, and the usual method is to open the doors. In the winter time this means the loss of considerable heat. To overcome these difficulties the Burt Manufacturing Company, Akron, O., is marketing a ventilator, specially designed for garages and its construction is such that it may be fitted easily and at a slight expense. In the accompanying illustration is shown one of the several types made by the company and by it the smoke, etc., is carried out of the building. The device includes means for regulating the opening of the damper. Another design has a glass window, a quality which will appeal to garages not properly illuminated by daylight. A booklet upon ventilating the garage will be mailed free by the company upon application.

The Burt Ventilator.

AUTO SCIENCE IN CURRICULUM.

Automobile science is the latest addition to the curriculum of the engineering department of the University of Southern California. A one-hour unit credit will be given to those availing themselves of the course, which will consist primarily of lectures, one every other week, given by experts who will explain the Selden patent and what it consisted of when first filed in 1879 down to the present day of luxurious cars.

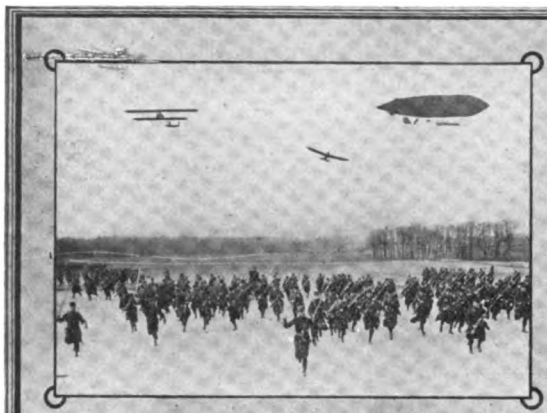


It is the purpose of the instructors to give the students a thorough knowledge of the working principles and mechanism that make up a motor car and to give its history from the earliest times when gasoline engines were considered a farce. The lectures will be taken up in a systematic manner as follows: "Introduction and History;" "Dissection of the Auto;" "Power Plants;" "Driving Mechanism;" "Lubricants;" "Lubrication;" "Accessories;" "Tires and Their Making;" "Selection of an Automobile;" "Traffic Laws and Rules of the Road;" "Commercial Uses;" "Races and Benefits;" "The National Highway;" and "Electrics."

WILL USE SAGER BUMPERS.

Announcement is made by the J. H. Sager Company, Rochester, N. Y., that the Cadillac Motor Car Company and the Packard Motor Car Company, both of Detroit, have selected the Sager Diamond bumper as standard equipment for their 1913 models. The design to be employed by the Cadillac is shown in the upper portion of the accompanying illustration and a feature of it is that it is adjustable for width. The bumper proper is a heavy steel tube of diamond shape and finished in brass, black or nickel.

The model to be fitted by the Packard company was especially designed and while it is of the clamped-on type, the clamps are invisible, a design that does not detract from the appearance of the car. The solid brass tube has a steel reinforcement and the retaining arms are adjustable for width. The finish is black and nickel.



Qualities emphasized of the Sager Diamond bumpers are their sturdiness and light weight, and the company is very much pleased with their

The Sager Diamond Bumper Adopted as Standard Equipment for 1913 Cadillac and Packard Cars, the Smaller Model Being Used by the First Named Machine.

indorsement by the makers of the Cadillac and Packard cars. The J. H. Sager Company also produces channel and round tube bumpers, and is marketing a special design for Ford cars.

Progress of Aerial Navigation.

Mechanical Details and Features of Construction.

STURTEVANT AERONAUTICAL MOTORS.

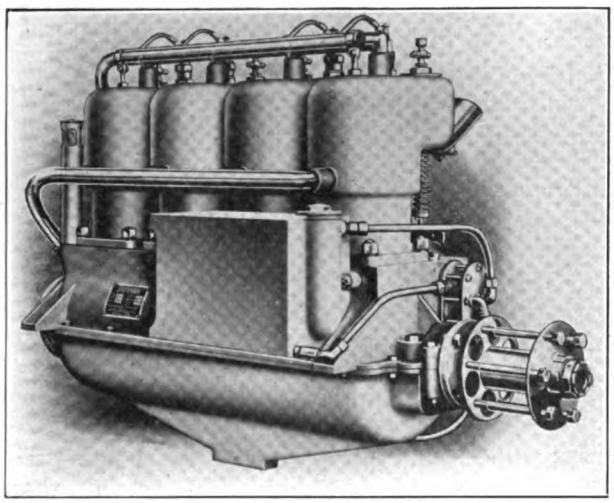
The B. F. Sturtevant Company, Hyde Park, Boston, Mass., is the selling agent for the Sturtevant Manufacturing Company, a concern which has been engaged in the production of motors for the past 50 years. It is perhaps one of the best known producers of engines designed especially for handling air machinery, and it is not surprising that it should have turned its attention to the aviation field.

The Sturtevant aeronautical motor is of the

Carburetor Side of Sturtevant Six-Cylinder Engine.

stationary, water-cooled, four-cycle type, and with either four or six cylinders, arranged vertically. The bore and stroke of either size are 4.5 by 4.5 inches. The weight of the smaller unit, complete with magneto, carburetor and oil tank, is 200 pounds, and of the larger 285. The rated horsepower is 40 and 60 respectively.

The policy of the company is that of developing a motor that will operate continuously for periods of 12 hours or more under full load, without stopping, without attention for oiling or adjustment and when inclined at any angle. The reduction in weight is held to have been accomplished by the design and the use of the strongest materials, but in no instance has necessary strength been sacrificed for this purpose. The same honest workmanship and reliable and durable construction is claimed as has been demonstrated in other lines of activity by this company.



The cylinders are cast separately of semi-steel, with integral water jackets and L shaped heads. After being machined they are tested with a hydraulic pressure of 600 pounds to the square inch, then heat treated and accurately ground. The pistons are of the same grade of iron, well ribbed for strength and provided with three rings. The wristpin is of large diameter, of hardened steel bored hollow.

Connecting rods are of I section, made of dropped forged nickel steel and with large bearing surfaces. The small ends are bushed with phosphor bronze and the big ends are fitted with die cast bushings of Parsons white brass. The crankshaft is cut from a solid billet of high grade nickel steel, with large bearings between each throw, and is bored hollow throughout for lightness and for the passage of oil. The propeller flange is applied on a taper to the forward end of the shaft. The camshaft is made from solid steel and all cams are integral. The shaft is of large diameter and is supported throughout its length on phosphor bronze bearings placed between each set of cams. The bronze driving gear is fitted to one end on a taper.

The base of the crankcase is a special aluminum casting with a view to strength and rigidity rather than extreme lightness. In the forward end is a ball thrust bearing which may be adjusted to take either the thrust or the pull of the propeller. Timing gears are enclosed in an oil tight casing. The lower portion is an oil sump, this being a light aluminum casting designed to

Digitized by Google

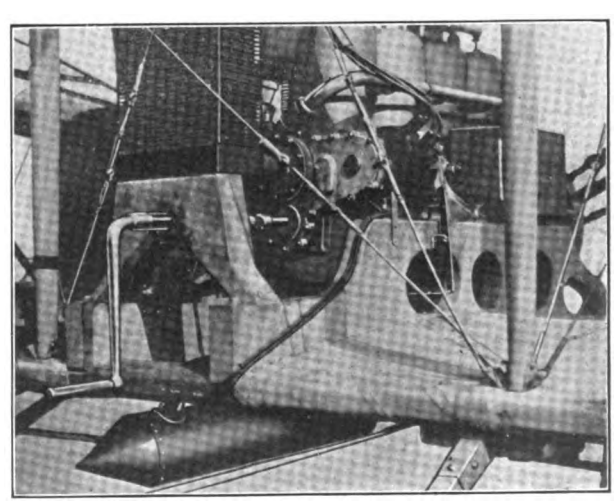
fulfill its only purpose, that of catching the oil as it falls from the base. It is so constructed as not to provide over lubrication no matter what

Back View of Sturtevant Four-Cylinder Power Plant.

the angle of inclination during flight may be.

Lubrication is by pressure pump, driven directly from the end of the camshaft, the oil being forced through cored holes in the crankcase base and into the hollow crankshaft. It is thus distributed to the bearings in which the crankshaft runs and also to the connecting rod bearings. From these it is thrown in a fine spray to all parts of the mechanism enclosed within the crankcase. Mounted in tandem with the first pump is a second, which takes the oil from the sump and forces it through a filter into the oil tank. The latter holds sufficient lubricant for three hours' flight, although it is possible to secure a larger capacity tank if desired.

The cooling water is circulated by means of a centrifugal pump of large capacity, the impeller of which is mounted on an extension of the crankshaft. The carburetor is a Zenith, which is held to be absolutely automatic at all speeds, and when once set at the factory needs no further adjustment. Two carburetors are employed on the six-cylinder unit. All manifolds are of ample proportions and the inlet and exhaust valves are of nickel steel, located in pockets cast integral with the cylinders. Ignition is by Mea high-tension magneto, mounted on the motor base and driven by gears running in oil from the camshaft driving gear.



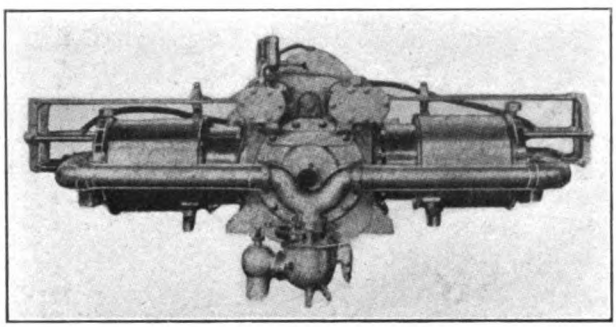
Two special features of the Sturtevant motor are the provision for starting in midair and the installation of a muffler. At the base of the valve stem is incorporated a valve lifting rod, which may be operated from the seat. Its function is to lift the exhaust valve, should the motor be stopped while in the air, thus releasing the compression, and the action of the air on the propeller will again cause the engine to take up its cycle of operations.

In keeping with the apparent demand for the installation of a muffler which has been indicated by the desire for a quiet running motor in military work, and as borne out by the recent change in design on the Wright engines permitting them to be muffled, the Sturtevant company has installed a muffler as a part of its power plant. The design is such that it may be detached instantly when not required, and its weight is but 18 pounds.

CALL HORIZONTAL MOTORS.

An aviation motor which differs materially from the forms more generally employed for such work is the Call, made by the Aerial Navigation Company of America, Girard, Kan. This is a four-cycle, water-cooled unit, with horizontal cylinders, made in two sizes, a two-cylinder engine of 50 horsepower and a four of 100. The bore is six inches and the stroke 5.25, on each. The first weighs 250 pounds and the other 400.

The cylinders and cylinder heads are cast separately of vanadium gray iron, and are reinforced at points where special stress is to be encountered. The two parts are secured together, and both to the crankcase, by 12 cap screws of



Four-Cylinder Sturtevant Motor Mounted in Burgess-Wright Biplane.

.375 inch diameter. The water jackets are of aluminum alloy, and the cylinder head is cast in-

valve stem is incorporated a valve lifting rod,

Digitized by Google

and exhaust valve chambers and seats being in the top of the explosion chamber. The valve seats are machined in the head, eliminating valve

Two-Cylinder Call Horizontal Engine Rated at 50 Horsepower.

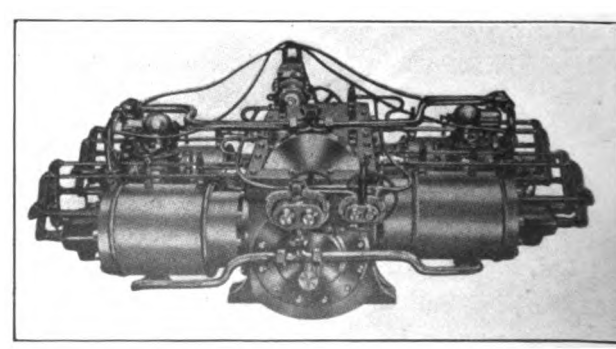
cages and facilitating cooling without intervening joints.

The pistons are made of the same high grade material and are ground to a perfect fit. The crankshaft is of chrome nickel steel, cut from the solid bar, two inches diameter between the bearings, and is solid throughout. The crankpin bearings are two inches diameter and 2.5 inches long. New Departure ball bearings are employed. The crankcase is of an alloy of magnesium, copper and aluminum, and is heavily ribbed.

Cooling is by means of a large size gear pump of phosphor bronze, which forces the water four times around the cylinder, spiral type cooling flanges being provided inside the water jackets, thence into the lower half of the crankcase, upward and around both valve cages and valve stem bearings, and then downward again into the upper half of the cylinder head proper. Additional cooling is effected by means of a full one-inch auxiliary exhaust at the bottom of the explosion chamber, which discharges the main portion of the exhaust into the outer atmosphere, without passing through the exhaust valve chambers. The piston heads are cooled by means of star type cooling flanges cast inside.

Lubrication is by splash. In order to prevent the escape of oil through the auxiliary exhausts, bottom rings are provided for the pistons, these being additional to the three regular rings at the top of the piston head. The bottom rings are always between the crankcase and the auxiliary exhausts. The crankpins and wristpins are lubricated by means of sight feed oilers placed directly over each connecting rod.

Ignition is by Mea magneto, with an option of Bosch if desired, supplemented by coil and batteries, two spark plugs being fitted in each cylinder head. Two carburetors are employed on the four-cylinder engine.



MASSACHUSETTS ROAD CENSUS.

The recent census of vehicles travelling over the highways of Massachusetts shows remarkable gains made by motor vehicles in the past two or three years. In 1909, the first traffic census ever taken gave a percentage of 42 per cent. of motor, to 58 per cent. of horse drawn vehicles, but the 1912 figures change this order materially.

At one observation point near Plymouth the report showed that 99 per cent. of the vehicles passing in one day were propelled by motor. In Lynn 96 motor vehicles in 100 were reported in one day; in Salem the observer found 88 per cent.; in Hamilton, 82; Rowley, 79; Beverly, 76; Gloucester, 92. The north shore route from Boston to Portsmouth showed 60 per cent. three years ago, while this year it increased to 85 per cent. On the highway from Boston to Springfield, the use of motor vehicles exceeded 80 per cent; from Springfield to Pittsfield it was 86 per cent.; through Stockbridge in southern Berkshire it was 62 per cent. These figures show that the highways of the state are principally used by automobiles.

NEW BUILDINGS FOR AJAX-GRIEB.

The Ajax-Grieb Rubber Company, maker of Ajax tires, is building a three-story addition to its plant at Trenton, N. J., to enable a greater output to meet the largely increased business of the past year. The new building will give the company a large group of units in its manufacturing

Four-Cylinder Call Motor Which Develops 100 Horsepower.

plant. It is planned to have the building completed by Jan. 1, so that the facilities will be increased in season for extraordinary spring demand.

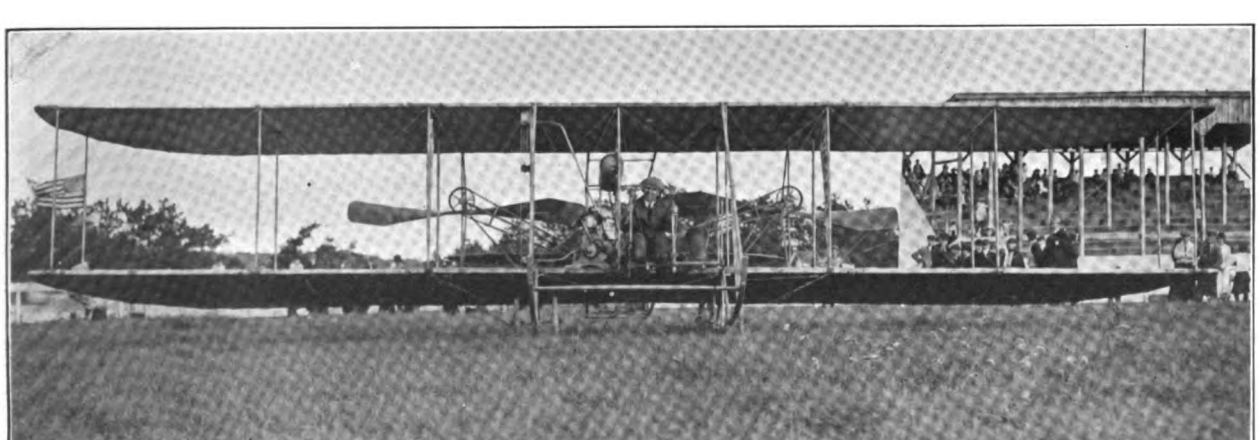
In The Aviation Field

With the Manufacturer and Operator in America and Abroad



Jack McGee of Pawtucket, R. I., who has been flying a Burgess-Wright biplane at several points in New England during the past summer, is planning to spend the winter months in the South. He gave three exhibition flights in his home city, during the past few weeks, the photograph which is reproduced herewith being taken just after his return from one of them.

McGee has given every evidence of being one of the most careful operators in America. His cross country flight from Boston to Newport, during which he was compelled to battle with counter currents over Boston harbor for two hours before being able to locate a favorable wind, will long be remembered as a splendid exhibition of skill in handling an aeroplane.

While the first actual use of aeroplanes in times of war was made during the recent conflict between Italy and Turkey, the latter nation was not supplied with aviators and machines sufficiently early to make the contest more than one sided. The defect has been remedied in the present war between Turkey and the Balkan States, as both sides are supplied with men and machines, most of these being volunteered pilots claiming allegiance to several different countries.

What is believed to be the first fatality in a war aeroplane took place at Adrianople, Oct. 30, when the Russian aviator Popoff, serving the Balkan allies, was brought down by the Turkish arms while reconnoitring in behalf of the Bulgarians. Many rifle shots had been fired at the machine in vain, but it is supposed to have been reached by cannon. Full details undoubtedly will not be made public until peace is declared, but the aeroplane was seen to fall suddenly and disappear within the Turkish lines.

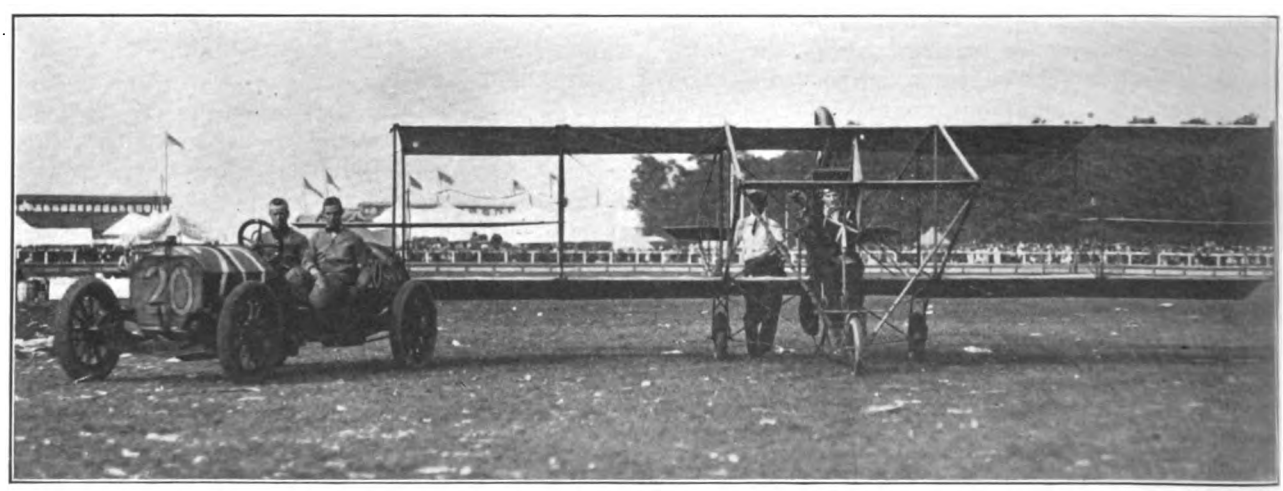
W. Irving Twombley of New York City, who recently secured a pilot's license, tried out his new safety device in a Bleriot monoplane at Hempstead Plains, Long Island, Oct. 25. The invention consists of straps which go over the shoulders and converge at a disc in front of the chest. This disc is fastened to the machine and the object is

Jack McGee and His Burgess-Wright Biplane Ready for Exhibition Flights in His Home City at Pawtucket, R. I.

Digitized by Google

to prevent the aviator from falling out of the aeroplane. The monoplane was permitted to fall to within a few feet of the ground before Twombley released the pin and jumped. The machine was badly damaged but the aviator escaped unhurt.

The new German naval dirigible, Zeppelin L 1 recently covered more than 1000 miles in 30 hours, flying from Friedrichshafen over Fulda, Emden, Hamburg and the Baltic sea. It first landed at Johannisthal, near Berlin, at the completion of the 30-hour flight, and was in wireless communication with the earth at all times. Count Zeppelin was in command.



This airship is said to be the largest yet built. Its dimensions are given as 525 feet long, 50 feet beam, and 776,600 cubic feet capacity. There are 18 gas cells, and power is supplied by three Maybah motors of 170 horsepower each. One motor is located in the forward gondola and two in the rear. The aluminum propellers in front have two blades and those in the rear four. The steering is connected with a compartment at the stern. The side steering is by six vertical planes and the elevation by eight horizontal planes.

On the top of the balloon is a platform made of aluminum compound, to serve as a lookout for the officers and also to support a machine gun. Instead of a cabin as with the regulation passenger carrying Zeppelins, a room for officers and men is built into the gangway.

Flying a Thomas biplane at Bath, N. Y., Oct. 31, Walter Johnson created a new American duration record with one passenger. His time was 3:51:15, exceeding the former mark of 3:42:22.5 made by George Beatty and a passenger in a Wright biplane during the Chicago meet of August, 1911.

Races between automobiles and aeroplanes have been featured at a number of agricultural fairs throughout the country during the past season. One of the most recent events of this character was a contest between Charles F. Keene in a Mercer car, made by the Mercer Automobile Company, Trenton, N. J., and the late Charles F. Walsh in a Curtiss biplane. This took place at the Inter-State fair at Trenton, and the Mercer defeated the aeroplane.

Another event of this character scheduled for the near future is a race between Anthony Janus in a Benoist hydraeroplane and A. M. Carlson in an automobile, the contest starting in Omaha and ending in St. Louis. This is to be a straight-away event, while the Trenton race was around a mile track. An accompanying illustration shows the Mercer and the Curtiss biplane ready for the starter's gun.

Charles F. Keene in a Mercer Automobile and the Late Charles F. Walsh in a Curtiss Biplane Lined Up for a Race Around a Mile Track at Trenton, N. J.

The Solane Aeroplane Company, New York City, will open a flying school at the famous old Dominquez field near Los Angeles, Cal., Nov. 15. The equipment will include four Deperdussin monoplanes, two Caudron monoplanes, a Bleriot monoplane and a Curtiss type biplane. Four instructors will be in charge.

In connection with this school it is announced that the Sloane company will maintain a passenger and mail service between Los Angeles, Pasadena, Colton and other cities in southern California, making regular trips with a passenger

Digitized by Google

carrying Deperdussin monoplane as nearly as possible according to a predetermined schedule.

The annual aviation salon in Paris was held Oct. 26-Nov. 8, the particular feature of the exhibit being the large number of military and naval aeroplanes, many of which were constructed as the result of public subscription. Aviettes, a term applied by France to machines propelled by human power alone, also were shown, these being segregated in a section by themselves. Considerable interest is felt in America concerning the newer models on view, but as yet no definite details have reached this side.

During the progress of the salon, a special session of the Permanent International Aeronautical Commission was held, Nov. 4-6, at which several matters affecting the safety of aviators were discussed. A number of important communications were received from military and civil experts, and the subject of automatic stability was given decided consideration.

Percy H. Reid, who is said to be the first Canadian to secure a pilot's license, finished his tests at Hempstead Plains, N. Y., last month. He will utilize a Deperdussin monoplane, although about two years ago he built and operated a Bleriot type monoplane. His home is in Montreal.

Miss Bernetta Miller has opened an aviation school near College Park, Md., and thus becomes the first woman aviator to undertake instruction in aeronautics. It is announced that none but women will be admitted as students, marking another innovation in this field.

The Society of Motor Manufacturers & Traders of Great Britain has decided to hold an international aeroplane exhibition at Olympia, London, in February, the exact dates not yet having been announced. This is the first time that Great Britain has held a display of this character entirely separated from that for motor boats. The event will be under the direct supervision of the Royal Aero Club of Great Britain.

N. L. Jansen of Denmark has produced an entirely new monoplane, with which he has been securing much success in flights at Skejby Mark. The chassis, which is somewhat reminiscent of the Blackburn, is entirely of steel tubing, while the front of the body is covered with sheet brass. The fuselage proper is enclosed with fabric. In general design the monoplane does not differ materially from the Borel. The engine is a 25-30 horsepower, two-cylinder Anzani.

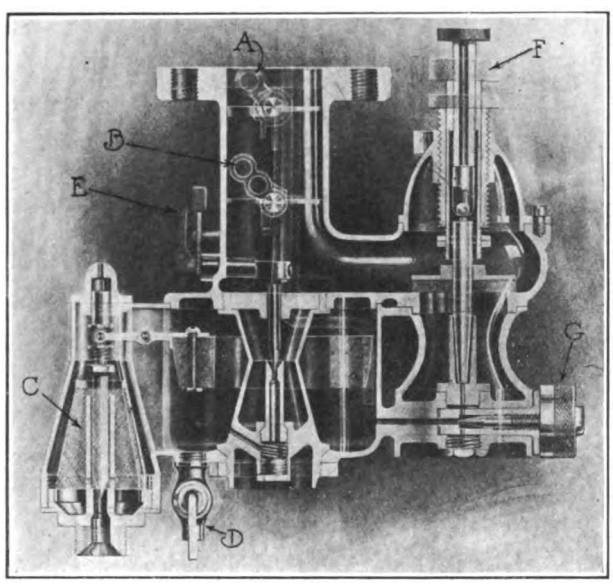
Naval constructors in connection with the Washington navy yard have built an hydraeroplane which follows closely the design embodied in the Curtiss so-called flying boat, although it is said to possess several distinctive features. Full details will not be disclosed until after the formal tests by the aerial corps at Annapolis.

The French army has had at its disposal about $1,750,000 for the purchase of aeroplanes during the present year, and this has been expended for no less than 300 machines. Besides these the government has 62 aeroplanes purchased by the national fund, making a grand total of 362 machines now owned and in operation, or ready for delivery.

King Albert of Belgium is greatly interested in aviation, as is evidenced by the fact that he was present at an early morning flight of military aviators taking part in the recent Belgian army aeroplane review. All the machines owned by the government are of the Henri Farman make, although some of them are built in Belgium under license from the French constructor.

The Portuguese government has purchased an Avro biplane, fitted with a 50 horsepower Gnome engine, built by A. V. Roe of England, who delivered the machine at Lisbon in person. Together with Copland Perry, an Avro aviator, the designer of the craft made several flights in instructing Portuguese soldiers in its operation.

It has been decided to postpone the suggested flying meet at St. Petersburg, Russia, until next spring, when the programme will include an aviation race around the Russian capital and the fetes to celebrate the tricentenary of the reign of the Romanoff house.



Louis Bleriot, who has been devoting his attention to designing and manufacturing, instead of flying, during the past two years, surprised his friends Oct. 24, by again taking to the air in a Bleriot hydraeroplane designed and built by himself. The new machine is of the monoplane design, weighing much less than other Bleriot constructions. With two passengers Bleriot flew it a mile in 1:30. It is practically the first hydraeroplane designed and built as such originating outside of America.

A Swiss aviator, Attilio Maffei, flying a Bleriot monoplane, recently crossed the Italian-Swiss frontier between Como and Lugano, although the trip proved more hazardous than he had planned. Mt. Generoza offered an obstacle that was not easily surmounted.

Flying a Deperdussin monoplane, a Belgian aviator, Crombер, recently covered the distance between Liege and Brussels, 110 kilometers (about 68 miles), in an hour.

The first aeroplane elopement is recorded from Hillsdale, Mich., Oct. 25. Arthur Smith of Fort Wayne, Ind., flew over to Auburn, Ind., where he alighted in a vacant lot and took on board Miss

The Feps Carburetor in Which Springs, Cams, Balls, Etc., Are Eliminated and of Which the Maker Emphasizes Easy Starting Quality as Well as Economy of Fuel.

Ami Cour, also of Fort Wayne. The two flew to Hillsdale and were married.

Flying a Curtiss hydraeoplane and accompanied by Lieut. L. H. Brereton, Lincoln Beachey recently went duck hunting over the Potomac river, near Washington, D. C. While the ducks and machines were in full flight Lieut. Brereton brought down four of the birds. The machine then dropped to the surface of the river and the ducks were secured without either man leaving the hydraeroplane.

A waiter named Petacchia, in Rome, Italy, has invented a multiplane, which he claims exhibits automatic stability. The initial tests indicate that he has solved the problem satisfactorily.

THE FEPS CARBURETOR.

The Feps carburetor, so named because it makes for flexibility, economy, power and speed, is the invention of J. L. Fritz and is being manufactured by the Schoen-Jackson Company, Media, Penn., which concern has secured the exclusive rights. A feature of the vaporizer is that it contains no springs, balls, cams or reeds, the correct mixture being supplied to the motor at different speeds by a construction that may be stated to embody two distinct carburetors and controlled by the amount of vacuum created by the position of the throttle, irrespective of the engine speed or load.

A sectional view of the Feps is presented in the accompanying illustration and it will be noted that the construction for the low speed involves the familiar venturi tube, having an adjustable jet, the device for setting being indicated at E. For the intermediate speed there is a flat leather faced disc and a perpendicular shaft which control the additional supply of gasoline and air for high speed and hill work, these members and their adjustment being indicated by F and G, respectively. The starting device is shown at A and the construction and operation of it is such that the motor is supplied with an extra heavy mixture, also automatically controlled by the vacuum. It is claimed of it that an engine may be started in cold weather with no more cranking than would be necessary in warm.

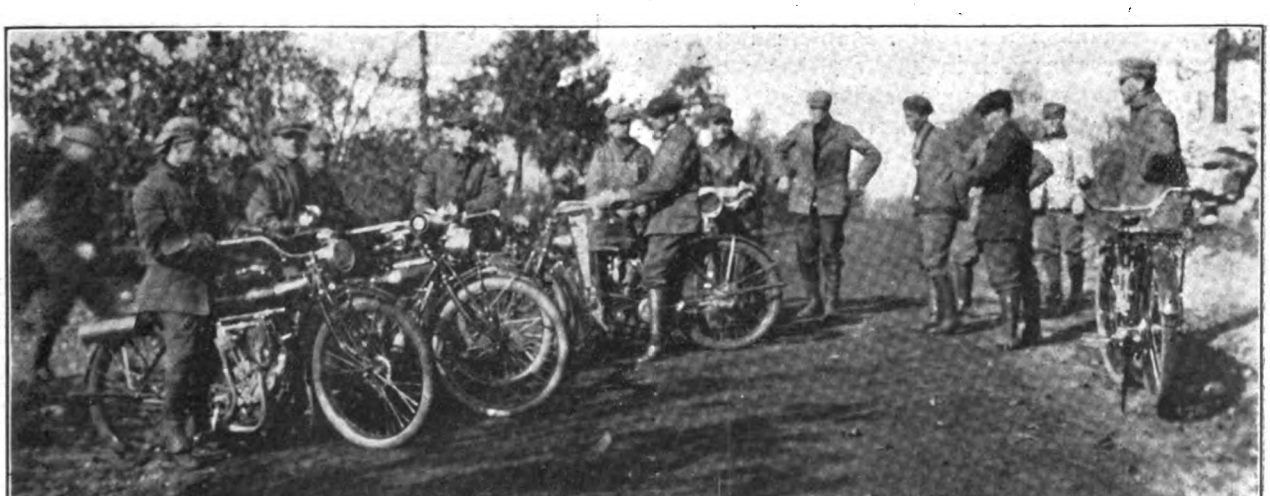
Provision is made for filtering the fuel, a self-cleaning strainer C being incorporated. Another quality of the Feps is its compact size, it being considerably smaller than those of ordinary types. The carburetor has been subjected to road and dynamometer tests and the maker maintains that it will give maximum mileage with a minimum consumption of fuel. It is also claimed that after being set it is not affected by climatic changes or altitudes, and being free from working parts its life is practically unlimited.

When the work is completed this fall on the trail from Edmonton, Alberta, Can., north, it will be possible to drive an automobile to Athabasca, Alberta, 100 miles, in 4.5 hours. Road Inspector Bell, who has crews at work on various divisions of the road, expects to finish it in the near future. Permanency is the keynote of the improvement, which is being carried on under the direction of John Stocks, deputy minister of public works for Alberta. J. R. Boyle, a member of the provincial parliament, also has devoted much time to the work.

Digitized by Google

ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

Emblem Adds Another Twin.



While it has been known for some time that the Emblem Manufacturing Company, Angola, N. Y., was preparing to announce a new twin for the 1913 season, the actual announcement has created something of a surprise, because the new member of the Emblem family is to have a rating of 10 horsepower. The new models will not be ready for the market until about Dec. 1, and photographs of the new twin will not be available until that time, but it is possible to disclose its principal features now.

First, it should be stated that the four horsepower single and the seven twin will be continued with several improvements and refinements. The former will be offered with either flat or V belt or chain drive, and magneto or battery ignition. Both twins are to be made with chain drive and magneto ignition only. This virtually gives the Emblem company a listing of seven models, although but three are claimed.

Having particular reference to the 10 horsepower twin, it has all the characteristics of the other Emblems, with the exception of its larger size. The four-horsepower single motor, for instance, has a bore of 3.5 inches and a stroke of four, and these are the dimensions of the big twin motor, while the seven has bore of 3.375 inches and stroke of 3.75.

All Emblem motors now have mechanically operated inlet valves of pushrod overhead rocker arm type. This upper portion has been continued without material change, but in the camcase there is a decidedly new feature. All four cams on the twin—two on the single—are mounted on one gear. The shaft is hollow and holes are drilled all the way through so that the distribution of oil is unobstructed. This keeps the cam surfaces well lubricated at all times.

Besides allowing a small, compact camcase, it is maintained that this arrangement makes valve timing an extremely simple proposition. If the cam gear is removed for any purpose, it can be replaced only in one position. This gives exactly the right timing for the valves as soon as the gear is slipped into place. The arrangement is the result of much painstaking effort on the part of Supt. J. C. Glas, and its compactness and simplic-

Members of the Providence Motorcycle Club, Providence, R. I., at the Recent Hill Climb.

Digitized by Google

ity are a source of considerable pride to him.

Flywheels of large diameter are continued. The motors also have bronze bearings now, a type new to Emblem practise. The cooling flanges on the cylinders are graduated, being wider at the top than at the bottom of the stroke, giving a neater appearance and a lighter casting. The intake manifold has been made much larger. The carburetor is still a Heitger.

Mr. and Mrs. M. E. Gale, Angola, N. Y., on Their Transcontinental Emblem.

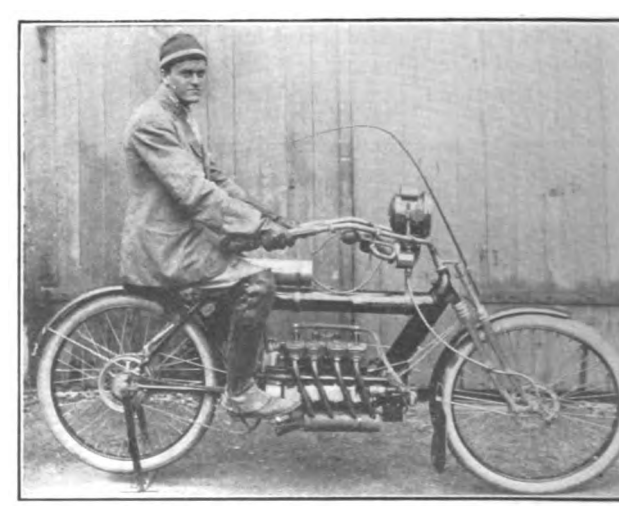
The tanks have larger capacity, carrying out the policy of the Emblem company to provide a machine suitable for long distance touring. Nine quarts of gasoline and three of oil are available at the beginning of the trip.

The lines of the frame and forks have not been changed, but the forks have been widened somewhat to give more clearance for tires, and tire chains can be employed if desired. A new feature is added to the spring forks, although it will be remembered that the Emblem first introduced the spring fork in 1904 and has continued it practically without change since that time. On the 1913 models there is an arrangement of packing around the plunger by means of which the air is compressed as the plunger starts up from the effects of the jar, the air cushions thus formed softening the action and absorbing the shock completely.

To insure quiet running, a new muffler has been designed. This is made of aluminum, with two compartments, packed with asbestos. By the time the exhaust gases get through it they are so split up and slowed down that the report is hardly audible, yet no back pressure is caused.

In addition to the hand pump, a sight feed oiler is provided for lubrication. The Eclipse clutch is regular equipment on all models, though a side lever will be supplied as an option. An option in brakes also is provided in the Corbin and multiple disc Eclipse. Regular equipment includes lugs for fastening a tandem attachment or luggage carrier. The Emblem tandem attachment, which was originally produced for use on these machines alone, has been changed so that it may be applied to any make of motorcycle.

A new three-piece crank is made interchangeable, so that it may be put on the right or left side, as required. The frame head, also is of new design, the forging having a large curved web between the upper and lower top tubes of the frame, making this point stronger and preserving more rigid alignment. The saddle is either a Troxel or Messenger at the option of the purchaser.



The feature of sturdiness, which is essentially an Emblem characteristic, is continued in the new luggage carrier. The framework is of channel iron, with five smaller bars to form the top. When finished, it is all in one piece, without joints and rivets, all fastenings being brazed.

Johnson Wins Road Race.

Elbert Johnson, riding a Harley-Davidson, was the winner of the 66-mile road race recently held by the Sunville Motorcycle Club of Pueblo, Col., from Pueblo to Florence and return. He covered the distance in 1:40.

pered by conflicting speed laws of various communities through which they travel.

Ready for Bothersome Dogs.

Nat Herreshoff, Jr., of Bristol, R. I., one of the members of the famous boat building family, has discovered a method of dealing with bothersome dogs, which he declares is simple and efficient. Young Herreshoff rides a four-cylinder Pierce, made by the Pierce Cycle Company, Buffalo, N. Y., and the accompanying illustration shows him ready for the road. The whip is carried in a specially constructed socket on the front forks and is within easy reach at all times.

Providence Men Get Medals.

The Providence Motorcycle Club, Providence, R. I., recently held an enjoyable smoker, at which awards were made to 39 participants, who finished in the ninth annual run of the club over the triangular course between Providence, Boston and Worcester. Those who received gold medals for perfect scores were: Frank O. Johnson, Arthur Dio, C. H. Frazier, T. J. Conroy, Wilfred Emin, L. W. Ludden, C. W. Aldrich, Earl Gove, Russell Coes, Charles Gustaveson, Jr., Paul Emerhoff, Howard Clarke, Carl Larson, W. H. Earnshaw, H. F. Hildreth, C. S. Sherman, Leslie Bryant, Glen Crandall, Joseph Parent, J. C. Loftis, G. W. Lane, Lincoln Holland, B. A. Swenson, A. K. Bramen, Miss Christie Ross, A. V. Howe, James Baxter, D. A. Rowley, C. H. Westcott, E. L. Buffington, E. A. Lutz, W. C. O'Brien, J. C. Garand, Morris Ross, J. G. Edwards, Fred Peterson, Caesar Litterio, E. G. Luther, C. W. Rayhill and Henry W. Monroe. A silver medal was presented to Frank Labonte, who secured a score of 992, and a bronze medal to A. J. Gaudreau as a survivor.

More Space for Chicago Show.

event in the history of exhibitions is shown by the fact that Manager J. S. Vogel has found it necessary to secure 4900 additional square feet of

August Kiskakaros of Karintine, Greece, Starting on His World Wide Trip on a Merkel Mount.

space to accommodate the entries. The original contract called for 13,000 feet, so that the space now available will be about 18,000 square feet. When it is known that the motorcycle section in the 1912 Chicago show occupied only 3500 square feet, the proportions of the coming display can easily be imagined.

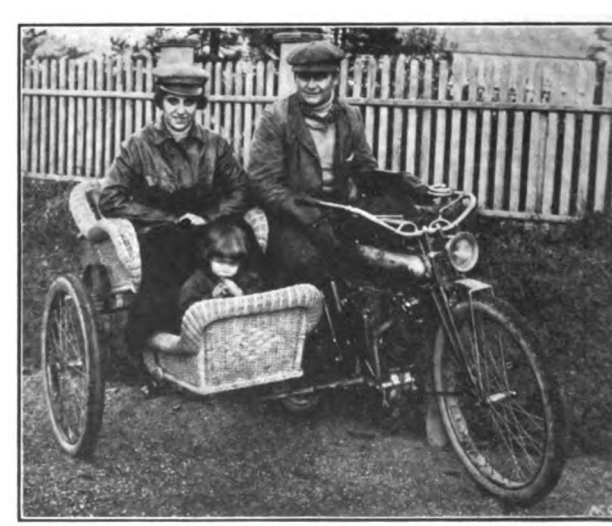
Merkels for Greek Army.

An accompanying illustration presents August Kiskakaros, a native of Karintine, Greece, who recently left this country with a Flying Merkel motorcycle, made by the Miami Cycle & Manufacturing Company, Middletown, O., on a trip around the world. He purchased the machine of Henry Hornberger, Merkel agent in Springfield, O., where he has been working for the past two years, and his original intention was to solicit funds from his fellow countrymen in an effort to secure motorcycles for the Greek army.

Endurance Test in Lynn.

The 24-hour endurance run conducted by the Lynn Motorcycle Club, Lynn, Mass., was won by the Brockton team, composed of Earl Gove, Charles Helander, Leon Ludden and George Clark, all of whom finished with perfect scores. All contestants were required to cover 410 miles in practically 22 hours, checking stations being maintained at Worcester, Springfield and Pittsfield, Mass.; Hartford, Conn., and Lynn. The winning team was awarded a handsome gold loving cup. The individual riders who finished within the time limit included John R. Rodrigues, C. H. Bacheller, Gus White, A. F. Orcutt, F. B. Beaudin, E. S. Mills, A. B. Matterson, Kenneth Bryan, Howard Clark, Strafford Hennegin, J. C. Foster and W. J. Walker.

Zieman's Hard Tour.



H. J. Zieman of Grand Junction, Col., has completed a tour of Colorado lasting 18 days, encountering the hardships and dangers of mountains and valleys in pouring rains during the greater part of the journey. He covered 1687 miles, or an average of more than 100 miles daily, as his actual running time was 15 days. His records showed an average of 83 miles a gallon of gasoline. He rode a Yale machine.

New Agents for Merkel.

The following new agents have been appointed to handle the Merkel motorcycle, made by the Miami Manufacturing & Cycle Company, Middletown, O.: William Coleman, Akron, O., two counties; W. D. Andrews Company, Buffalo, N. Y., western New York and eastern Pennsylvania; Fred Stenger, Cincinnati, O., Hamilton county; Fred J. Barr, Davenport, Ia., Iowa; Newby Bros., Kansas City, Mo., three counties in Missouri and 14 counties in Kansas; H. Johnson, Dallas, Tex., Texas, Louisiana and Oklahoma. Although the 1913 announcement has not been made, one-half the contemplated output is already contracted for.

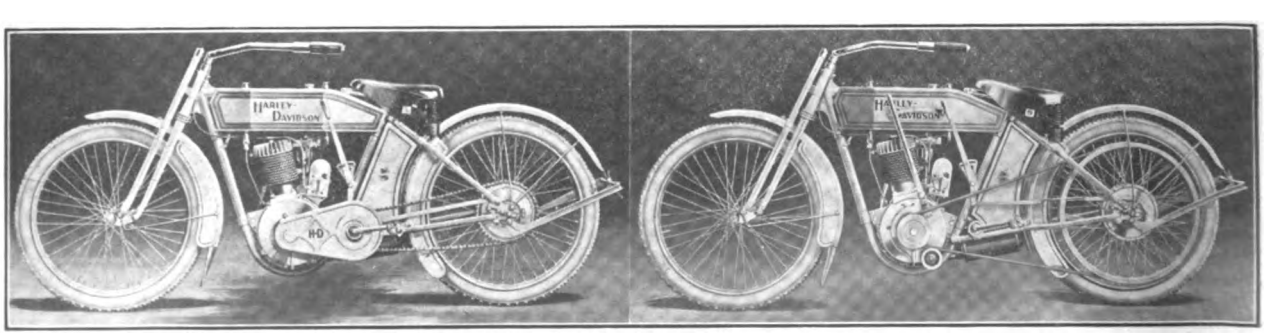
The 1913 Harley-Davidson Twin, Rated at 7-8 Horsepower.

to be away from home a greater portion of the time. The illustration herewith shows the plan evolved by him, permitting Mrs. Johnston and their young son to accompany him on his long trips. The mount is an eight horsepower M-M twin, made by the American Motor Company, Brockton, Mass., and fitted with a sidecar attachment. With this Johnston contemplates an extension of his field of operations, and if his present plans mature he will visit practically every state in the Union.

The New Harley-Davidson.



The Harley Davidson Motor Company, Milwaukee, Wis., announces three new models of the Harley-Davidson mount for the 1913 season. These are to be known as the 9-A, 9-B and 9-E. The first two are single-cylinder machines, practically the only difference in which is the substitution of a belt drive for chain in the 9-A. The 9-E is a twin. Standard construction on all models includes Bosch magneto, "full-floteing" seat and "free wheel control."

The motor of the singles is designated as a "5-35," signifying that it is a five horsepower unit with 35 cubic inches piston displacement. While it may be regarded as new, in the sense that it is only just making its appearance in the market, it may be stated that it has long since passed the experimental stage, having actually been on the road for the past two years.

The pushrod on the independently operated overhead mechanical inlet valve is fitted with a silencer spring, a construction which has met with favor on previous Harley twins. Another noticeable feature is the chain transmission, now offered as an option. This drive is by means of double roller chains through a countershaft to the free wheel control device, located on the rear wheel. Large sprockets greatly reduce chain noise.

Internal refinements include a heavier flywheel, and following usual practise the flywheel and reciprocating parts are carefully machined to balance before assembling. The complete unit is then balanced as a whole to make for unusually smooth running at all speeds. The pistons are lighter this year. Both the inlet and exhaust chambers and passages have been enlarged materially. A new design of the hot air intake on the carburetor has silenced the noise sometimes heard when the motor was running slowly or pulling hard on hills or heavy roads.

The motor in the twin is rated at 7-8 horsepower and has a piston displacement of 60.34 cubic inches. Its design and construction is not unlike that which was presented on the 1912 model, but several improvements are noted. Realizing that the connecting rod bearing is called upon to do harder work than any other one part of the machine, particular attention has been paid to this member. After trying several kinds of bronze bearings and a number of ball bearings, the engineers worked out an entirely new type of double roller bearing, in which two independent sets of rollers, one for each connecting

Two Harley-Davidson Singles for 1913: At Left, Model 9-B, with Chain Drive; at Right, Model 9-A with Belt.

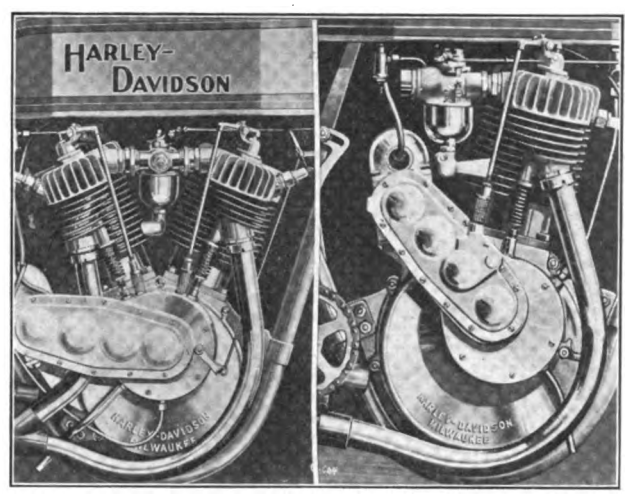
Digitized by Google

rod, both work on the same crankpin. All twins are equipped with self-aligning imported ball bearings on the drive side of the crankshaft.

Other refinements which may be held to apply to all models are: Oil pocket in the exhaust chamber which catches any excess oil, preventing it from running down the exhaust valve stem and over the crankcase. More clearance is afforded between the mudguards and tires, allowing the use of chains on even three-inch tires, if desired. Regular tire equipment is 28 by 2.75 inches. Wider forks correspond with increased clearance all around. The rocker plates on the front forks are now made of nickel steel and are fitted with removable hardened steel bushings to take up wear and the sides have heavier reinforcements. Longer recoil springs make for a more perfectly balanced action in the forks.

The operating lever for the free wheel control is put in a more convenient location. Timing gears and cams are made of nickel steel with cam and gear integral. All Bosch magnetos are of the armored type. A concealed Yale type of lock insures the contents of the tool box. The chain driven models are provided with a double eccentric crank hanger, providing separate and independent adjustments for both front and rear driving chain, and pedalling chain as well. The belt drive is protected by a fender attached to the crankcase forward of the pulley.

Hill Climb at Providence.



The special committee of the Providence Motorcycle Club, Providence, R. I., recently held the postponed hill climb, which was deferred until a suitable grade could be located. The course was a half mile long and the event was won by B. A. Swenson, riding an Indian, in 0:25. Second place went to Clifford Frazier; third, J. C. Garand; fourth, C. A. Anderson; fifth, A. Carlson; sixth, J. G. Edwards.

Hour Race Was the Feature.

At the recent motorcycle races at Columbus, O., a feature was the hour race, which was won by L. P. Birkenbach, who rode a Thor and covered 64.5 miles during the 60 minutes. Don Klark, on an Indian, led until the 48th mile when Birkenbach passed him. The latter did not leave the track once during the run, while Klark stopped for oil once, thus losing the lead he had gained. Ray Snyder, on a Merkel, stopped three times for oil and finished third.

Englewood Club Ends Season.

The Englewood Motorcycle Club of Chicago closed its season with the fourth quarterly endurance run from Chicago to Niles, Mich., and back, a total of 198.6 miles. Twenty-two riders started and there were 17 perfect scores, two finishing with loss of points and three dropping out. The 17 were: Edward LaViolette, A. Collins, R. T. Purdy, Oscar Harris, C. P. Huls, Peter C. Thom, Roscoe McLaughlin, all riding Harley-Davidson machines; Harry W. Parker, Andrew Drier, H. F. Wessell, B. M. Blankenheim, E. Mead, R. E. Kewley, Excelsior; J. R. Purdy, Gale Smart, Indian; George Bour, Thor; Thomas Monroe, Special. Charles Hafner, Harley-Davidson, had a score of 991, and George Durst, Excelsior, 872. John Fielding, Indian; A. Fisher, Excelsior, and Henry Busse, De Luxe, did not finish. Peter C. Thom won the gold medal offered

The 1913 Harley-Davidson Motors: At Left, the Twin-Cylinder; at Right, the Single.

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

B. A. SWENSON 298 Blackstone St., Cor. Prairie Ave. Providence, R.I.

1913 F. N. SHAFT-DRIVE MOTORCYCLES.

Lightweight Single, with Two-Speed Gear $275

by the club to the rider making the highest score in the four runs of the season, 3852 out of a possible score of 4000. Oscar Harris won the silver medal, having the second highest mark, 3720. Both rode Harley-Davidson machines.

Miss Heyen on a Merkel.

An accompanying illustration presents Miss Sophia B. Heyen of Brooklyn, N. Y., who claims to be the first woman rider in that city. She has taken part in a number of club runs conducted by the various organizations on Long Island, and her mount is a six horsepower, belt driven Merkel, made by the Miami Cycle & Manufacturing Company, Middletown, O.

Fine Outlook for Indian.

The Hendee Manufacturing Company, Springfield, Mass., maker of Indian motorcycles, recently held its annual business meeting and the reports submitted by the various officials were most encouraging. The sales of Indian machines amounted to 19,500, as against 10,000 in 1911, giving a cash increase of 70 per cent. It was announced that by the first of the year the concern will be employing 1800 men, 600 more than at present. During the past year machinery and tools valued at more than $100,000 have been added to the equipment and the addition to the factory will be ready in about a month. The export trade has grown considerably and now the Indian machine is in use in Europe, Asia, Africa, Australia, Japan, New Zealand, Philippines and other islands of the Far East.

Miss Sophia B. Heyen, Brooklyn, N. Y., and Her Merkel.

The officers of the company for the coming year were chosen as follows: President, George H. Hendee; vice president, Oscar Hedstrom; clerk and treasurer, Frank J. Weschler; directors, George M. Hendee, Oscar Hedstrom, William E. Gilbert, E. A. Carter and William B. Thompson. These are all re-elections.

Los Angeles Motordrome Opened.

Motorcycle racing was inaugurated on the Los Angeles motordrome last month, the opening meet furnishing some good entertainment for several hundred people. W. C. Hamilton on a P. E. M. created a new record of 1:52.2 for two miles on a stock single-cylinder machine. The results follow:

Two miles, professional, invitation—First, McNeil, Indian; second, Fleckenstein, Indian; third, Wold, Indian; time, 1:39.

Two miles, professionals, open—First, Humiston, Excelsior; second, Graves, Indian; third, Ward, Indian; time, 1:37.

Three miles, professionals, invitation—First, Fleckenstein, Indian; second, McNeil, Indian; third, Wold, Indian; time, 2:29.2.

Three miles, professionals, open—First, Humiston, Excelsior; second, Ward, Indian; third, Montgomery, Indian; time, 2:20.8.

Four miles, professionals, invitation—First, Fleckenstein, Indian; second, Wold, Indian; third, Verril, Indian; time, 3:26.

Four miles, professionals, open—First, Ward, Indian; second, Humiston, Excelsior; third, Montgomery, Indian; time, 3:21.2.

Six miles, Angel City Motorcycle Club Derby—First, Humiston, Excelsior; second, Ward, Indian; third, Montgomery, Indian; time, 5:05.2.

Two miles, consolation—First, Kinney; second, Bennett; third, Regnon; time, 1:40.

Club Notes, Here and There.

About 40 members of the Utica Motorcycle Club, Utica, N. Y., recently enjoyed a run to Cortland, N. Y., and were agreeably surprised at the manner of their reception, although the Cortland enthusiasts did not know of their coming until the day before. A banquet was given the visitors and they were allowed the freedom of the Cortland headquarters. The run was made without incident in ideal weather.

The Harley-Davidson riders of Philadelphia, Penn., recently held a run to Egg Harbor, N. J., where they enjoyed a banquet, with Alexander Klein of Egg Harbor and William Heckenhorn of Camden, N. J., Harley-Davidson agents, acting as hosts. The party numbered 111.

A club has been formed at Freeport, Ill., with officers as follows: President, Dell Cole; vice president, C. L. Bossmeyer; secretary-treasurer, J. Boyd Luebbing.

The following concerns have been incorporated recently to manufacture or deal in motor cars, accessories, etc.:

S. Breakstone, Inc., Chicago; $50,000; to deal in motor vehicles and accessories; incorporators, R. Storch, W. H. Davenish, J. Warner.

Eldridge Manufacturing Company, Boston; $25,000; automobiles; incorporators, William E. Eldridge, Harold R Church.

Rambler Motor Car Company, Inc., Haverhill, Mass.; $10,000; incorporators, George A. Burnham, James P. Molloy, Charles S. Goodwin, Frank B. Kimball.

McVey Manufacturing Company, Dayton, O.; $60,000; to manufacture automobile accessories, machines and mechanical appliances; incorporators, James L. McVey, Walter C. Fraine, Amos N. Burkhart, Millie Galloway, Richard J. McCarty.

Tri-Unit Electrical Company, Newark, N. J.; $100,000; general automobile business; incorporators, John B. Stobaeus, Jr., B. W. Matthews, William C. Stobaeus.

Continental Garage Company, Newark, N. J.; $10,000; general automobile business; incorporators, Littleton Kirkpatrick, Robert C. German, Stuart A. Young.

Ultra Motor Car Company, Boston; $100,000; incorporators, John C. Foster, Charles B. Moseley, William W. Blatt.

Hendricks Manufacturing Company, Camden, N. J.; $250,000; to deal in automobiles and accessories; incorporators, F. R. Hansell, John A. McPeak, F. S. German.

Elmhurst Motor Sales Company, Elmhurst, Ill.; $10,000; general motor car and garage business; incorporators, Walter B. Kidder, Hosmer H. Allyn, Frederick H. Bates.

United States Puncture Proof Tire Filler Company, Boston; $50,000; incorporators, Robert E. Magee, Austin Wilson.

Rockford Motor Truck Company, Rockford, Ill.; $10,000; to manufacture and sell electric and gasoline motors; incorporators, P. A. Peterson, Levin Faust, John Ledin.

Nyack Garage, Nyack, N. Y.; $15,000; incorporators, Alan Leggett, John J. Laine, Paul J. Dubois.

Neverskid Manufacturing Company, New York City; $50,000; to manufacture devices to prevent slipping of motor vehicles; incorporators, Charles H. Stanton, George L. Lewis, Daniel E. Wing.

McFadden Auto Company, Rock Hill, S. C.; $3500; incorporators, V. B. McFadden, D. B. McFadden.

Automobile & Garage Company, Yoakum, Tex.; $20,000; president, A. J. Ross; treasurer, J. Lyons; secretary, D. J. Shall.

T. F. Haarn Company, New York City; $10,000; transportation by means of vehicles, motor cars, vans, etc.; incorporators, Elizabeth Hahn, Jeannette A. Bravy, Charles A. LeFyre.

Joliet Auto Supply Company, Joliet, Ill.; $5000; incorporators, B. S. Moore, Thomas H. Bracker, John H. Garsey.

Kammer Automobile Company, New York City; $10,000; incorporators, William Magsamen, Frances Kammer, Max A. Kammer.

Perfection Automobile Body Company, New York City; $15,000; incorporators, James V. Simpson, William H. Mendel, Jr., William H. Mendel.

Hopkinsville Cadillac Company, Hopkinsville, Ky.; $10,000; to do general automobile and garage business in eight counties; incorporators, R. E. Cooper, T. W. Blakey, Odie Davis, Richard Levell, E. G. Peterson.

Grant Six Company, New York City; $15,000; to deal in motors, machinery, etc.; incorporators, Clarence P. Hulst, William G. Miller, James B. Speyers.

Blackburn Garage & Water Supply Company, Goldsboro, N. C.; $3000; to engage in the automobile business; incorporators, H. C. Smith, M. H. Allen, W. A. Blackburn.

Elyria Auto Sales Company, Elyria, O.; $10,000; to manufacture and deal in automobiles; incorporators, W. G. Bennett, I. W. Lyon, F. S. Bates, Correll H. Smith, J. J. Dillon.

Marion Garage & Auto Company, Marion, O; $15,000; incorporators, Burr Custer, Edgar S. Payntor, Gilbert P. Butterworth.

D. F. Poyer Company, Menominee, Mich.; $75,000; to manufacture commercial motor vehicles; incorporators, D. F. Poyer, H. T. Emerson, Fabian Trudell.

General Rim Company, White Plains, N. Y.; $150,000; to deal in motor vehicles and parts; incorporators, F. Oberkirsch, W. Kaul, Robert W. Ashley.

McDonough-Cogan Motor Car Company, Newark, N. J.; $25,000; general automobile business; incorporators, E. W. McDonough, F. T. Cogan, G. P. McDonough.

Auto Supply Company, New Haven, Conn.; $20,000; to manufacture automobile engines, motors, etc.; incorporators, George D. Atwood, Charles D. Johnson, Raymond S. Bishop, John N. Champion, Everett T. Martin.

WITH THE MANUFACTURERS.

The Motz Tire & Rubber Company, Akron, O., maker of Motz cushion tires, has opened a direct factory branch at 4 Dundee street, Boston, Mass., in charge of M. A. Frank. This will succeed the New England agency formerly held by the Standard Tire & Rubber Company in that city.

Harry H. Elmer, formerly director and general manager of the Grant Motor Car Company and the Grant-Lees Machine Company, both of Cleveland, O., has resigned. Although he has been approached by several interests since this fact became known, it is understood that he will devote his attention to certain personal matters for the present.

The Century Electric Motor Car Company, Detroit, of which John Gillespie is the head, has moved its factory to the new building erected by the company at Woodward and Lathrop avenues and has started work with two shifts, night and day. The offices also will be moved to the new plant.

The Star Carburetor Company, 685 East Atwater street, Detroit, maker of Star carburetors, will be known in the future as the Star Foundry & Machine Company. The plant has been extended so that the making of carburetors is now a small part of the work done. Another new building will be added at once to take care of the rapidly increasing business.

The K-R-I-T Motor Car Company, Detroit, maker of K-R-I-T cars, will provide for a salesroom in the new one-story service station now in course of erection at the factory.

The Apperson Bros. Automobile Company, Kokomo, Ind., held a meeting of its stockholders at the company's office recently, when Elmer Apperson, Edgar Apperson and T. E. Jarrard were elected as directors for the coming year. Later, at a meeting of the board of directors, officers were elected as follows: President and general manager, Elmer Apperson; vice president, T. E. Jarrard; secretary and treasurer, Edgar Apperson.

Digitized by Google

The Ignition Starter Company, Detroit, has moved into the new factory building shown in an accompanying illustration. This concern manufactures the Disco starting system, now in use on some 30 different makes of cars, and one of the features of its business has been the fact that no matter how rushed it has been it always has been able to make prompt delivery. This same service is still further guaranteed by the completion of the new building.

A. T. Carbahan, veteran tire salesman of the Swinehart Tire & Rubber Company, Akron, O., has been appointed district manager in charge of Ohio, West Virginia, Kentucky, western New York, western Pennsylvania and eastern Michigan.

The Oakland Motor Car Company, Pontiac, Mich., maker of Oakland cars, has opened a factory branch at Birmingham, Ala. The salesroom and service station is located at 619-621 South 20th street, where trained factory men are ready at all times to give factory technical service. L. L. Barnes is manager of the plant.

L. A. Austin, until recently sales and advertising manager of the Rutenber Motor Company, Marion, Ind., has resigned to become general sales manager of the Mais Motor Truck Company, Indianapolis, Ind.

The Sturdy Manufacturing Company, Chicago, maker of Sturdy spark plugs, has taken over the Sta-Rite line of ignition plugs, consisting of the Venus, Vulcan and Gotham. The Sta-Rite Vulcan plug is of the double porcelain type, the Venus, a mica plug and the Gotham a single hollow porcelain spark plug. The Sturdy company will also build special brand spark plugs on a large scale for the 1913 season.

New Factory of the Ignition Starter Company, Detroit.

The Henderson Motor Car Company, Indianapolis, Ind., maker of Henderson cars, has closed contracts for the following agencies during 1913: Henry L. Hattemer, Montgomery, Ala.; Herbert Nuttall, Pacific Grove, Cal.; S. F. Ruff, Stockton, Cal.; J. Ramselius, San Jose, Cal.; Wesley B. Parker, Ventura, Cal.; Williams Bros., Lordsburg, Cal.; P. J. Weisel & Co., Anaheim, Cal.; Dr. Charles L. Wetzel, Miami, Fla.; Wynn W. Scott, Haines City, Fla.; R. C. Neely & Co., Waynesboro, Ga.; D. D. Snyder & Co., Danville, Ill.; Frank J. Adams, Salisbury, Md.; W. S. Farrant, Grand Rapids, Mich.; The Bergen Auto Company, Fargo, N. D.; Monroe City Auto Company, Monroe City, Mo.; H. J. Morse, Saranac Lake, N. Y.; Falls Auto & Sales Company, Cuyahoga Falls, O.; C. D. Hershberger, Wilkesbarre, Penn.; Automobile & Supply Company, Lancaster, Penn.; George T. Bergeron, Calvert, Tex.

The R-C-H Corporation, Detroit, maker of R-C-H cars, has closed 1913 contracts with the following dealers, who will handle the cars in their respective territories: C. H. Dean, San Antonio, Tex.; Harry Washburn, Bath, Me.; J. J. Youd, Mt. Bullion, Cal.; E. M. Dates, Santa Rosa and Sausalito, Cal.; George C. Hupp, Birmingham, Mich.; George W. Garland, Holyoke, Col.; Crescent Garage & Supply Company, Crescent City, Ill.; Muncie Garage, Muncie, Ind.; Burkhalter Bros., Mulberry, Ind.; Greider & Hawkins, Flora, Ind.; H. L. Gilbert, Chillicothe, Mo.; Howard C. Parker, Center, Tex.; C. M. Story, Wabash, Ind.; Kathryn P. Carroll, Hartford City, Ind.; Becker Automobile Company, Portland, Ore.; G. E. Kelly, Kossuth, Penn.; Dr. P. M. Raysor, Bryan, Tex.; Rudolph Dittmar, Massbach, Ill.; Perry & Westin, Newberry, Mich.; Berry Garage, Chicago; W. W. Calhoun, Fort Gaines, Ga.; K. W. R. Detwiller, Palmerton, Penn.; Max Wolcott Garage, Corning, N. Y.; A. S. Baker & Son, Stratton, Col.; Newton Root, Kalamazoo, Mich.; Grant S. Emery, Jonesville, Mich.; V. H. Hancuff & E. S. Shelly, Williamsburg, Penn.; P. E. Weimer, Rockwood, Penn.; Corn Belt Auto Company, Waterloo, Ia.

The Kissel Motor Car Company, which is soon to establish a branch factory at Milwaukee, Wis., recently invited the members of the Milwaukee Merchants & Manufacturers Association to make a pilgrimage to its plant at Hartford, Wis. The accompanying illustration shows the party about to leave the station in Hartford in 24 KisselKar pleasure cars.

The Imperial Automobile Company, Jackson, Mich., maker of Imperial cars, has established a factory branch at San Francisco. G. A. Troutt, direct from the Imperial factory, has taken over the Imperial interests for the entire Pacific Coast and a large service station has been established at San Francisco for Imperial owners.

The Marathon Tire & Rubber Company, Cuyahoga Falls, O., will soon enter the market with pneumatic tires and reliners. Will Ridge, vice president and general manager, was formerly with the Firestone Tire & Rubber Company, Akron, O., maker of Firestone tires. Walter Jenks, secretary and treasurer, is an engineer of repute who has much knowledge of the tire business. Franklin Kesser, sales manager, enters his duties after long training, lately with the Firestone organization. The company expects to have its new factory in operation in a short time.

The M. & M. Company, 500 Prospect avenue, Cleveland, O., has placed on the market a new product, the Lubro non-freeze fluid for radiators. It is claimed to withstand a temperature of 10 degrees below zero without freezing. It does not expand when frozen, so that even if it should freeze in exceptionally cold weather there would be no harmful results. The M. & M. lubricants have enjoyed a reputation in the market that will give an impetus to the new article.

The Cole Motor Car Company, Indianapolis, Ind., maker of Cole cars, has appointed the following agents for the coming year: L. Kampf, Armington, Ill.; C. C. Hinckley, Aurora, Ill.; C. W. Walters, Bloomington, Ill.; F. W. Davis & Sons, Fall River, Mass.; Ft. Wayne Iron Store Company, Fort Wayne, Ind.; Model Machine Works, Frankfort, Ind.; H. A. Knease & Sons, Iowa City, Ia.; Fleming & Brown, Kankakee, Ill.; Kewanee Garage, Kewanee, Ill.; Elsen & Phillips, La Crosse, Wis.; Hotel Brown Garage Company, Middletown, N. Y.; W. J. Riley, Momenee, Ill.; J. L. Wiese & Son, Champaign, Ill.; John Henwall Auto Company, Chicago; J. B. Chambers & Son, Danville, Ill.; Cole-Montgomery Motor Company, Montgomery, Ala.; Royal Automobile Company, Montreal, Can.; L. M. Magee, Needham, Ind.; B. E. Brading & J. M. Swick, Olney, Ill; C. W. Robison & Co., Peoria, Ill.; A. R. Slinger, Portage, Wis.; Dale Dietrich Ravenna, O.; Welby C. Waterfield, Sandusky, O.; Cole Motor Company, Sioux City, Ia.; Van Duyn & Mathias, Springfield, Ill.; Frank L. Winters, Decatur, Ill.; G. H. Dean & Co., De Kalb, Ill.

The Rutenber Motor Company of Marion and Logansport, Ind., has acquired a plant at Chatham, Ont., where Rutenber engines will be manufactured for the Canadian trade. G. W. Bowen, the new president of the Rutenber company, will be at the head of the concern.

The Knight Tire & Rubber Company, Canton, O., has increased its capital from $500,000 to $1,500,000 in order to make large extensions and improvements to its plant.

H. D. W. Mackaye, assistant to the president and director of affairs of the Keeton Motor Car Company, Detroit, maker of Keeton cars, and also of the Keeton Motors, Limited, Brantford, Can., has announced that eastern interests with which he is connected contemplate the establishment of one of the largest body building plants in the world for the manufacture of automobile bodies of both wood and steel. Joseph W. Mackaye will be president of the concern and H. D. W. Mackaye will be treasurer and general manager. The capitalization of the company is understood to be $200,000.

GARAGE AND DEALER.

The Fisk Rubber Company of New York City has completed additions to its branch at 1725 Broadway, New York City. A new four-story and basement service building on 55th street has been merged with the quarters which front on Broadway. The branch is in charge of Jay B. Cothran.

Paul R. Pelz, who has been temporary director of the Benz Automobile Import Company, will soon return to the Benz headquarters at Mannheim, Germany. The management of the American branch will be taken by William F. Dietzsch, who has been previously connected with the automobile industry abroad.

The Federal Motor Supply Company, Cincinnati, O., has been formed with capital of $250,000 and will handle accessories and supplies for automobiles, trucks and motor driven vehicles of all kinds. Five retail houses are to be established immediately in the Middle West, which will draw their supplies from the Cincinnati house. The officers of the company are: President, George W. Platt; vice president, Fred H. Berold; secretary, Jesse W. Wozencraft; assistant secretary, F. W. Stukenborg, formerly with Coughlin & Davis; treasurer, Emil G. Schmitt.

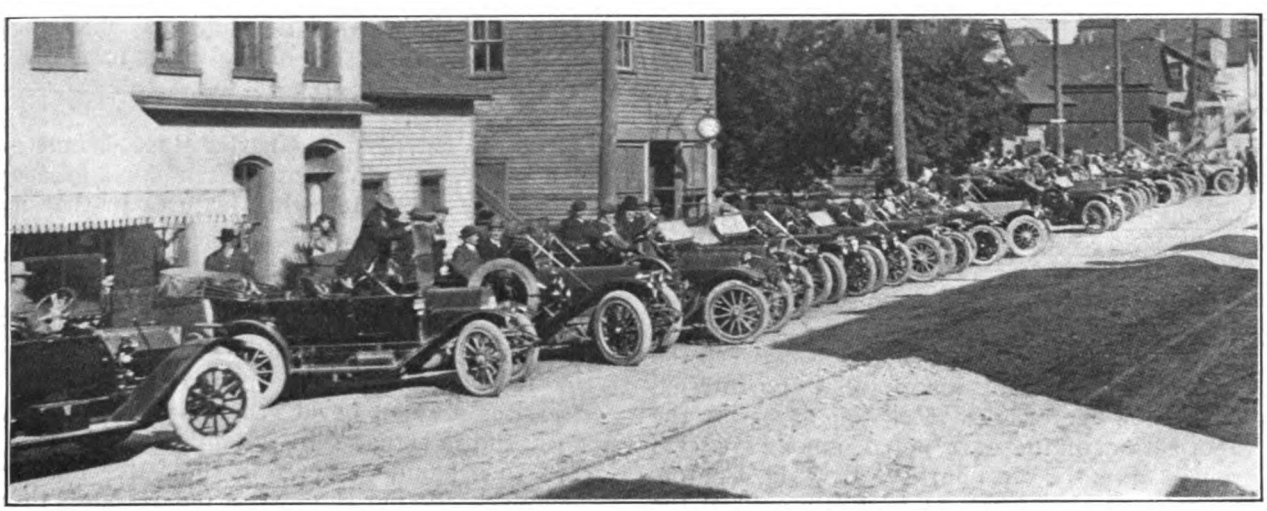
Frank R. Parker, Boston, well known as Elmore agent in that territory since 1905, has joined the sales force of the Motor Car Manufacturing Company, Indianapolis, maker of the Pathfinder pleasure and commercial lines, representing the concern in New England with headquarters in Boston.

L. W. Place, at one time connected with the sales force of the Buick Motor Company, Flint, Mich., maker of Buick cars, and later with the Olds Motor Works, Lansing, Mich., maker of Oldsmobile machines, as assistant to the general manager, has been appointed foreign representative of the General Motors Company. He sailed from Vancouver, B. C., and his first stop will be Australia. He will be gone 18 months, during which time he will visit every country of note in the eastern hemisphere.

F. McFadden, formerly affiliated with the American Roadster Company, New York City, has signed a three years' contract with the Kline Kar Motor Company of Pittsburg, Penn., and will be sales manager of the Pittsburg district.

The Frederick E. Murphy Automobile Company, Minneapolis, Minn., is to erect a new and modern automobile building at Hennepin avenue and 13th street, to cost $140,000. The building will front 137 feet on Hennepin avenue and have a depth of 144 feet on 13th street. It will be three stories high and will have the largest showroom devoted to motor vehicles in the West. It will be ready by March 1.

A. G. Schonacker, general manager of the Marvel Carburetor Company, Flint, Mich., has resigned on account of ill health and expects to locate in the West, where he hopes to take up an agency in a section that will be conducive to building himself up physically. Mr. Schonacker joined the Marvel company when it was comparatively small and leaves it at a time when its output for the current year is contracted for.



H. R. Averill, who has been connected with the Pullman Motor Car Company, York, Penn., maker of Pullman machines, has resigned his position.

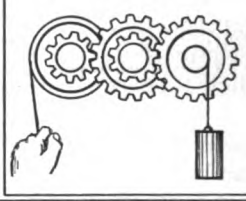
David C. Fenner, Jr., New York sales manager of the International Motor Company, maker of Mack, Saurer and Hewitt trucks, has been promoted to be manager in full charge of the New York branch of the company, with all its territorial departments.

Col. K. C. Pardee, a pioneer of the retail trade, has resigned as general manager of the United States Motors New York Company, distributor of the Maxwell lines, to become identified with a concern now forming to enter the manufacturing field. The nature of the business has not been stated.

C. E. Osborn has been appointed Pacific Coast manager of the Speedwell Motor Car Company Dayton O., maker of trucks and pleasure vehicles, succeeding R. Harry Croninger, who will return to the Dayton factory to assume the management of the truck department, although retaining the presidency of the Pacific Coast branch.

William A. Baxter, formerly general sales manager of the Dayton Auto Truck Company, Dayton, O., maker of Durable Dayton motor trucks, has been appointed sales manager of the Pan-American Motors Company, San Francisco, distributor of the Durable Dayton trucks in the Pacific Coast states.

Members of the Milwaukee Merchants & Manufacturers Association Leaving Station at Hartford, Wis., in 24 KisselKars to Visit the Hartford Plant of the Kissel Motor Car Company.



J. K. Gewinner, prominent in the automobile accessory field in Atlanta, Ga., has severed his connection with his former associates and organized the Johnson-Gewinner Company, at 83-85 North Forsythe street and 124 Peachtree street. The firm will carry a varied assortment of automobile accessories. It will also conduct a finely equipped shop in charge of a man educated at the factories, for the care of magnetos, carburetors, etc. The company will specialize in this work so as to give service and satisfaction to manufacturers whose lines have been neglected in that territory and whom Johnson-Gewinner Company will represent in a thorough manner.

Capt. John J. Seay has purchased of Capt. J. L. Bass, Rome, Ga., as an investment, the building now occupied by the Seay-McCartha Garage & Auto Company and the Southern Steam Laundry on East First street. He will remodel the building for the exclusive occupancy of the garage. The consideration is said to have been $14,000.

R. S. Keeves, Oregon, Mo., has disposed of his interest in the J. H. Keeves Automobile Company, to his son, John H. Keeves, for $6200. The latter has sold a half interest to H. G. Cook and the firm is now known as the Keeves-Cook Auto Company.

Digitized by Google

RECENT MOTOR VEHICLE PATENTS

Beck Priming Cup.

A patent has been granted to Charles W. Beck, Rockville Center, N. Y., for a gas engine priming cup in which the usual petcock and lever construction is eliminated. The cup comprises a base having a longitudinal priming aperture and an extension at its upper end. The cup proper is formed of a cylindrical shell having an inwardly turned annular flange at its lower end, the base extending into the cup and being enlarged at its upper end to interlock with the flange on the cup, thus securing it to the base. A closure plug is threaded into the cup, this being provided with a needle valve at its inner end so adapted as to close the outer end of the priming aperture in the base. The plug is so constructed as to permit of the passage of the priming fluid and carries a closure device adapted to close the outer end of the priming aperture.

Bergold Mixer.

Several devices for incorporation between the carburetor and intake manifold of the internal combustion motor, and designed to assist the vaporization of fuel, are noted among patents granted recently. Wilbur W. Bergold, Canton, O., assignor of one-half to J. M. Bergold of the same city, has secured letters patent for a mixing device which comprises a gauze interrupting disc provided with an offset rim portion and flanged rim members mounted above and below said offset rim portion of the disc. Upwardly and laterally inclined stationary deflecting blades are secured to the disc, which is provided with a plurality of openings. The mixture from the carburetor strikes the gauze and is broken up into a fine spray and deflected by the blade members.

Loftus Cooling Device.

Thomas J. Loftus, Castella, Cal., assignor of one-half to Harmon Bell, Oakland, Cal., has been granted a patent for a device to automatically inject water into the cylinder of a combustion engine. It comprises a supplementary cylinder fixed in the main cylinder and has two parts of dissimilar diameter, also a closure for the outer end. A valve member is located contiguous to the main cylinder, having a screw threaded and adjustable stem in the closure at its outer end. A spring actuated plunger is fitted in the part of the larger diameter, which is bored for the passage of the valve stem, which has its seat at the lower end of the part. The plunger seat is kept normally closed upon the valve member and is raised therefrom by the explosions in the main cylinder. The flow of the water is controlled by a valve member and passes into the cylinder when the port of the seat and that of the water inlet register.

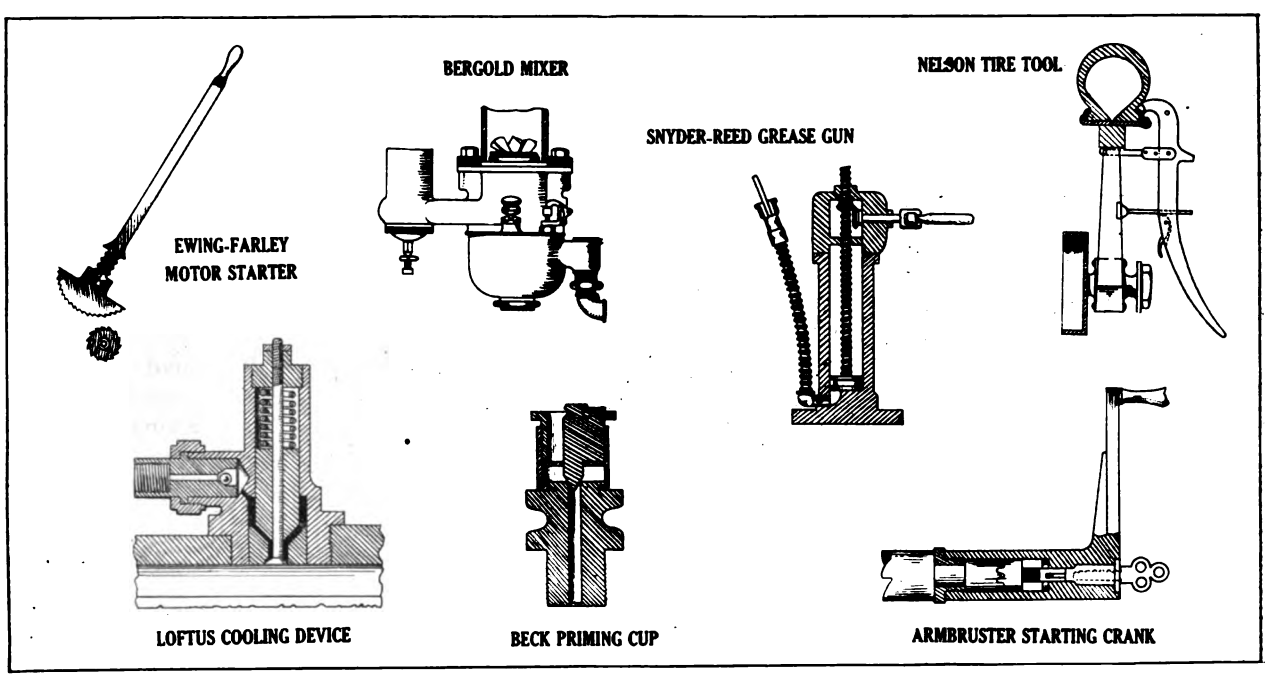
Snyder-Reed Grease Gun.

Henry C. Snyder and Charles Reed, Minneola, Kan., have been granted a patent for a grease gun that presents interesting features in that it is provided with a flexible tube for conveying the lubricant to the part. The shell is made in two portions, one of which forms a removable head. The latter has an annular opening which fits an annular flange upon the shell member, making a joint. The plunger or piston is threaded and carries a small bevel gear loosely mounted upon it and is actuated by a similar member attached to a handle. Rotating the latter moves the plunger, forcing the grease out through the flexible tubing and nozzle.

Nelson Tire Tool.

A tire tool that is an improvement over devices of a similar nature is that patented by Axel A. Nelson, Washington, D. C. The lever is provided with an offset arm at one end for engaging the casing ring and the fulcrum bearing is secured through an extension having a curved end for the purpose of gripping the spoke of the wheel. A strut is incorporated between the fulcrum member and the handle and is provided with a ratchet and pawl mechanism, which secures the lever in the different positions into which it may be moved when in engagement with the tire.

Ewing-Farley Motor Starter.



George K. Ewing and Colby R. Farley, Ewington, O., have been granted a patent for a mechanical motor starter for automobiles. A hori-

Digitized by Google

zontal shaft at right angles to the motor shaft carries a bevel gear which is meshed with a similar member upon the engine shaft. A ratchet toothed pinion is secured to the starter shaft and a ratchet toothed sector is so constructed and arranged as to mesh with the other pinion. The hand lever is longitudinally slotted and shouldered and carries the sector. An abutment is opposed to the shoulders of the lever and a horizontal pivot extends through the slot of the lever. A helical spring is compressed between the abutment and shoulders whereby the lever and sector are normally retracted.

Armbruster Starting Crank.

John C. Armbruster, Minneapolis, Minn., assignor of one-half to Ernst A. Armbruster of the same city, has patented a key actuating motor starting crank designed for the purpose of preventing others than those possessing a key from starting the engine. The device is simple in its operation, and when the key is removed, the interlocking teeth of the motor shaft and starting crank cannot be meshed. The lever of the starting crank is provided with a long sleeve like hub in which is mounted a pair of co-operating clutch members having interlocking teeth at their abutting faces. One clutch member is provided with a reduced stem portion, to the outer end of which is secured a hollow ratchet tooth head, the teeth being adapted to engage with similar members upon the shaft of the motor. The stem portion is journalled in a sleeve like bearing, the reduced end of which is screwed into the hollow end of a lever hub. In this manner this clutch member and head are held against endwise movements in respect to the lever hub, but are free to rotate in respect thereto. The clutch member is free for sliding movements within the lever hub, but is held for rotation by lugs on the other clutch member, that engage with slots formed in the interior of the hub. The rotary clutch operating bolt or stem is rotatively mounted in the outer portion of the lever hub, has threaded engagement with the first clutch member, and itself is held against endwise movements, so that by rotation thereof the two clutch members may be engaged and disengaged. The clutch operating bolt is constructed with threads of such pitch that one rotation will move the first clutch member from its normal inoperative position into operative, or vice versa. A small tumbler lock of the Yale type is employed, the barrel of its case being seated within and rigidly secured to the outer end of the lever hub, and its rotating tumbler is flexibly connected by a link to the outer end of the rotary bolt. When the clutch members are disengaged by the movement of the key mechanism, the starting crank is rendered inoperative in that the lever and its hub will rotate freely and will not mesh with the other clutch member.

Illustrating Recent Inventions of Interest to the Manufacturer, Agent and Owner, Including Key Actuated Starting Crank, Tire Tool, Motor Starter, Grease Gun and Priming Cup.

NEW GASOLINE ENGINE BOOK.

The Norman W. Henley Publishing Company, 132 Nassau street, New York City, has published a new work entitled "Gasoline Engines, Their Operation, Use and Care," by A. Hyatt Verrill. The book is very comprehensive, simple in text and practical in its application. The numerous drawings make clear the construction, design, installation and troubles, and the whole is intended for the owner, operator or purchaser of gasoline motors, who is not a mechanic or engineer. A table of troubles, causes and remedies is a decidedly valuable addition.

R-C-H AND WIRELESS TELEPHONY.

E. C. Hanson of Los Angeles, Cal., has been making very interesting and exhaustive experiments with wireless telephony, in which an automobile was utilized for the first time in this field of science. The car was an R-C-H, made by the R-C-H Corporation, Detroit, and an accompanying illustration shows the machine on Lookout mountain, with the crew receiving messages from another station on Long Beach, Cal., 35 miles distant.

Strapped to the front and rear of the car were sectional poles supporting aerial wires and high voltage insulators tuned to a definite wave. These were able to pick up the waves propagated through space at the rate of 186,000 miles a second from the sending station, these waves impinging on the aerial wires on the car, oscillated through the primary coils of the tuner to the earth connections, thus setting up surges of electric energy of varying amplitude according to the voice at the transmitting station.

Vibrations in the secondary coil actuated a very delicate crystal detector, which in turn charged a condenser and discharged through the delicate wireless telephone receiver held to the ear of an occupant of the car. Every modulation and variation in tone from the transmitting station caused a similar synchronous current at the receiving station in the car. The current at the receiving station was supplied by the lighting storage battery on the car.

The experiments were conducted for the purpose of determining the practicability of using wireless telephony on automobiles, and the success was such as to indicate that in the near future any motor car owner may carry such equipment in his machine if he so desires.

E. C. Hanson Experimenting with Wireless Telephony Between Lookout Mountain and Long Beach, Cal., with 1913 R-C-H Touring Car.

FIRESTONE ELECTRIC CAR TIRE.

One of the most important developments of the annual conference of salesmen of the Firestone Tire & Rubber Company, Akron, O., maker of Firestone tires, was the announcement of a new electric vehicle tire. It is interchangeable on pneumatic rims, whether standard clincher or quick detachable clincher and is of dual tread type. The maker claims for it that the unusual amount of resiliency built into the tire is the secret of its success in exhaustive tests.

It is stated to be a fact that the bearing surface of a tire has much to do with the amount of electric current consumed by the car. Too little bearing surface, on the other hand, causes friction which will retard the car and waste electric current by this resistence. The new tire, by a scientific exactness of resiliency and consequent bearing surface, is claimed to avoid both pitfalls.

The Hoosier Motor Club of Indianapolis, Ind., is about one year old, but it has accomplished many things of benefit to automobilists and the public at large. One of its most notable accomplishments was the vehicle light ordinance, which was passed by the city council.

WEED CHAINS
PREVENT ACCIDENTS LIKE THIS

What an awful game of chance we sometimes play on the checkerboard of Life!
How narrow is Life's victory over Death at times!
What a contrast is here presented! What an object lesson this scene portrays!

Absolute control and **perfect safety** on the one hand; on the other an "unruly, balky" machine, whose seemingly greatest ambition was to bring its occupants face to face with disaster.

Picture for yourself the story:

Two cars traveling the same country road—a rainstorm overtakes them. Reaching a treacherous, slippery curve—

ONE CAR with scarcely any noticeable slackening of speed rounds the curve and **passes on in perfect safety.**

THE OTHER at the critical moment, **skids,** and in a flash, plants itself in front of the onrushing trolley.

A mass of wreckage, "nerve-shattered" passengers and a lasting memory of what might have been if the trolley car had not been stopped.

One Car was skid-proofed with Weed anti-skid Chains. **The Other** was not. Take the lesson home.

Weed Chains

Absolutely Prevent Skidding

Are you still taking your life in your hands by refusing to take the necessary precaution against the dangers of skidding? Are you still unwisely depending on "rubber alone" for the safety of yourself, the occupants of your car and other road users?

Make safety yours—take no chances. Fully equip your own car with Weed Chains today and **insist,** for your own protection, that other drivers do the same.

Weed Chains cannot injure tires because "they creep;" are put on in a minute without the use of a jack or other tools. Use them on all four tires.

NEWTONE SUPERIOR

The First Efficient Motor Horn to sell at a popular price

Our $10 MOTOR HORN

Newtone Superior has created a tremendous sensation in the automobile trade for its EFFICIENCY, for PRICE and for ECONOMY. It uses only 2½ amperes; and a battery can last five months without recharging.

$1000 Reward

to the manufacturer, jobber, dealer or agent in the automobile trade who can produce or show us a motor driven horn now on the market of equal efficiency and quality to the **Newtone Superior** selling at our price (listed at ten dollars.)

We claim to have the best motor warning device on the market at this price.

Eight years in the exclusive manufacture of auto signals—during which time we have made and sold over ONE MILLION AUTO HORNS, and incidentally spent thousands of dollars in experimental work in perfecting our product—has made it possible for us to produce.

CAR MANUFACTURERS—Include **Newtone Superior** in your 1913 equipment.

DEALERS—Newtone Superiors will sell three to one. You should be well stocked.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS---A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. **TRY THEM NOW.**

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that **"Invader"** Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

DIRECTIONS

For Starting A Gasoline Engine In Cold Weather

One Way

Crank a while, then tickle carburetter. Crank some more. Open petcock in all cylinders and drop a little gasoline into each. Tickle carburetter and spin engine violently for five minutes.

Next, drain off anti-freeze mixture and fill tank with boiling water, then crank again. If engine starts, replace anti-freeze. If not, wrap a flannel cloth tightly around carburetter, saturate with hot water and crank a while, always remembering that if you Crank long enough friction will warm up your engine.

Should engine remain stubborn, waste saturated with gasoline and plugged into air intake, may help. Now try Cranking. Do it again. If too tired to keep at it, probably some by-stander will volunteer—let him go to it—it will rest you and afford you some amusement.

If engine hasn't started, examine your switch—perhaps it wasn't turned on. Crank some more—stand and look at machine—cuss a little—that may help.

Now if it won't start, 'phone a garage and take a trolley to business.

ANOTHER WAY
The Simplest and Best
USE AN
Electric Self-Cranker
OPERATED FROM AN

GLBA

STORAGE BATTERY

It will eliminate your cold weather cranking troubles, crank your engine at any time, any place, instantly and surely, just by a push of a button.

Use the Class A GLBA With an Electric Lighting Generator.

Use the Class B GLBA With an Electric Self-Starter.

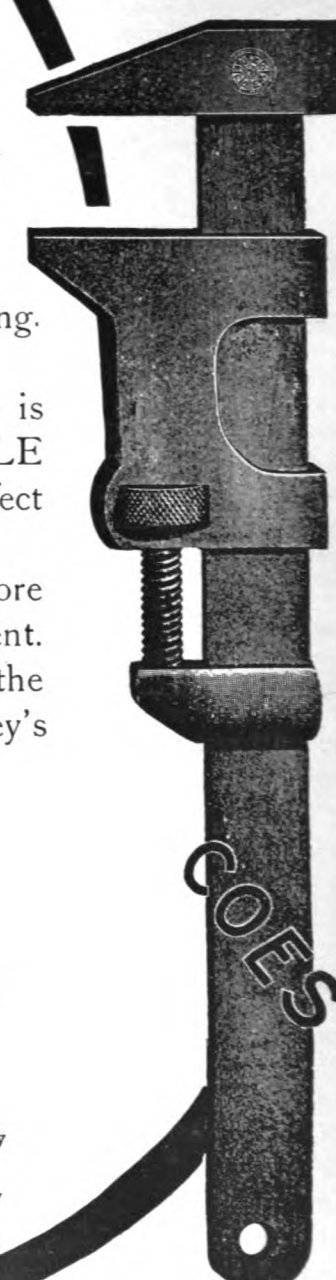
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

EMPIRE

"The Little Aristocrat"

Style, Distinction and Character in every line; Thoroughbred Speed, Power and Strength in keeping with the unusual quality of its design. Completely Equipped, $950.00, with

Mohair Top,
Top Envelope,
Storm Curtains,
Windshield,
Robe and Foot Rail,
Pump and Jack,
Prest-O-Lite Tank,
Head, Side and
Tail Lamps,
Speedometer,
Tire and Tool Kit,
Eisemann Magneto.

THE $950.00 completely equipped EMPIRE Five-Passenger Touring Car is indeed a "LITTLE ARISTOCRAT." Everywhere it is winning its way with the intelligent, cultured class, who demand a car of moderate size and price, and *who insist on having a real car*, built of quality materials, and honestly constructed.

Aside from its alluring beauty and style, which impel admiration, THE EMPIRE has proved its durability and efficiency for continued service under the most exacting conditions.

Steep hills, deep mud or sand never impede "THE LITTLE ARISTOCRAT." Its surplus power converts road obstacles into *opportunities for demonstrating its efficiency.*

Its rugged construction and sound materials account for its rare endurance and stability, even under cases of excessive misuse.

Even *we* underestimated the high merit and popular appeal of the EMPIRE Five-Passenger Touring Car. We knew that in time "THE LITTLE ARISTOCRAT" would come into its own kingdom. We foresaw increased demand. But we were amazed *when necessity*, two months ago, *compelled the establishment of a second factory.* Our increased facilities now make it possible to supply the big demand.

If *you* are in the market for a car of moderate size and price, send for our new illustrated "LITTLE ARISTOCRAT" Folder, which describes THE EMPIRE completely and in detail.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ **ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.**

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3½ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
	3½-in. Auto Clock.....	28.00	30.00	45.00	Only made in
	3½-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—Add $3.00 to above Price Lists. (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS

You want the Best? Ask your DEALER for the "CHELSEA"

The Stutz is a mechanical certainty

Ask any dealer or any motorist who knows the STUTZ ---ask any STUTZ dealer or STUTZ owner---and without exception they will endorse it as a mechanical certainty.

The STUTZ owner likes his car because it is free from mechanical troubles. The dealer likes the STUTZ because with it he can win out against any and all competition---and best of all after a car is once sold he is not continually called upon to make adjustments until his legitimate profit is eaten up. That's why STUTZ owners are satisfied and STUTZ dealers make money.

Consistency is a jewel---in a man or a motor car---and the STUTZ can show the most consistent record of any car made. In appearance the STUTZ is pleasing to the eye---a really beautiful car---and best of all it is sold at a remarkably low price, construction, workmanship and quality considered.

Whether you are a prospective STUTZ owner, or a prospective STUTZ dealer, write today for Booklet A-5, Advance Sturdy Stutz Announcement, Series B, illustrating and describing new models.

Get All You Can This Year in a "40"

This is a year of fierce competition in 40-horsepower cars.

There are 72 makers of Forties. For men are demanding in motor cars now reasonable power and room.

Scores of these makers try to outdo each other. This war of the "40's" has cut prices in two. And some "40's" today are the best-equipped, most luxurious cars on the market.

It is up to you buyers to get all you can out of this Forty fight.

What to Get

Get electric lights with dynamo. You are bound to want them, and they cost as an extra $125.

Get four forward speeds, like the costliest cars. Get oversize tires—4 1-2 inches wide---for that means immense economy.

Get 14-inch Turkish cushions for comfort. Get wide, long springs. Get wide seats and long wheel base.

Get big brakes for safety. Get driving parts sufficient for a 60-h. p. car.

Get hand-buffed leather upholstering, nickel trimmings, and a body finish of 22 coats.

These are points where makers skimp. Be sure you get them all.

Then get a price which underbids all others for the things you seek.

All for $1,585

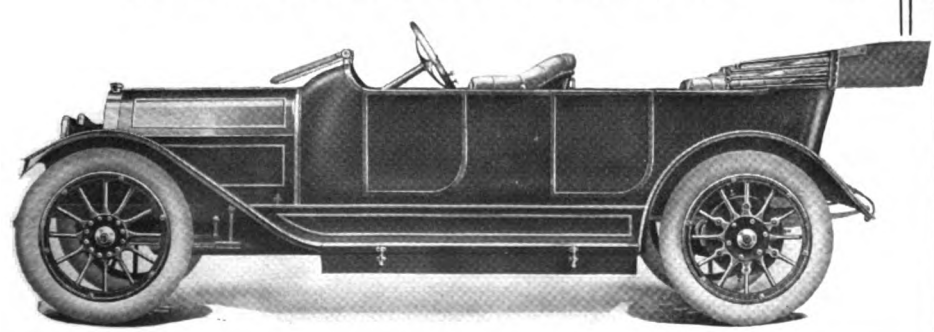
In the Michigan "40" you get all these perfections for $1,585.

You get a car built by W. H. Cameron, who has built 100,000 successful cars.

You get a body designed by John A. Campbell, who has designed for kings.

You get a car in which, in four years, we have worked out 300 improvements.

Because of enormous production, and this model factory, you get a "40" which leads this whole class at $1,585.



Go make your comparisons. Watch each specification. Look out for the differences which cut down the value.

See if any car in the whole Forty class gives what the Michigan gives for the money. For this is a war, and with 72 rivals you can get amazing values.

Send this coupon for our catalog. It pictures every detail, and helps you make comparisons. It shows the various bodies. Send the coupon today, and we will tell you where to see this car.

Michigan Motor Car Company, Kalamazoo, Mich.

Owned by the Owners of the Michigan Buggy Company (119)

Michigan "40" $1,585

With All These Special Features:

Four forward speeds, like all leading foreign cars.
Electric lights with dynamo.
Oversize Tires—35x4 1-2 in.
40 to 46 horsepower.
Wheel base, 118 inches.
Rear seat, 50 in. inside.
Turkish cushions, 14 inches deep.
Central control.
Left side drive.
Drive shaft sufficient for 60 horsepower.
Brakes Extra Efficient—drums 16x2 1-4 inches.
Springs 2 1-4 in. wide, 37 and 50 in. long.
Demountable rims.
Extra rim.
Steering post, clutch and brake pedals all adjustable to fit any driver.
Shortsville wheels.
Hand-buffed leather.
Best curled hair.
Body finish 22 coats.
Nickel mountings.
Electric headlights, very powerful, 12 1-2 in. diameter.
Sidelights flush with dash.
Windshield built in.
Mohair top, side curtains and envelope.
Electric horn.
$50 Speedometer.
Foot rail—robe rail.
Rear tire irons.
Tool chest under the running-boards, out of the way.
Over-capacity. Every driving part made sufficient for a 60-horsepower car.

Self Starter

Either gas or electric, furnished at moderate extra price. We do not include it because men differ about the type they want.

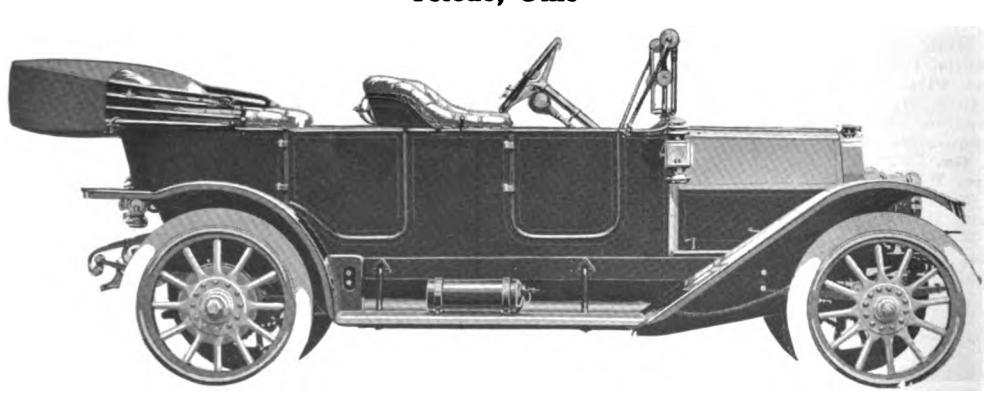
$985 Overland $985

Completely Equipped

Self-Starter	Remy Magneto
30 Horse-Power	Warner Speedometer
5-Passenger Touring Car	Mohair Top and Boot
110-Inch Wheel Base	Clear Vision Wind Shield
Timken Bearings	Prest-O-Lite Tank
Center Control	

High-priced feature No. 2



When an auto wheel hits a rut the frame must bend. Most popular priced makers try to hold the motor and transmission rigid by a *number* of arms. Overland motors are suspended at but three points. This method absolutely prevents disalignment. Otherwise, crank or gear cases bend and throw the engine bearings out. Disalignment prevents proper lubrication. It works general havoc with motor and transmission.

Experiment for yourself with three and four legged stools.

This is just one of the high-priced features in the Overland at $985. A catalogue for the asking tells you of the many others. Please address Dept. 52.

Beware of Spurious Magneto and Coil Parts

The Remy Electric Company of Anderson, Indiana, has obtained a permanent injunction restraining the

Monnier Auto Supply Company, of Detroit, Michigan

from selling spurious magneto and coil parts to fit old types of Remy ignition devices.

WE HAVE FILED SUITS AGAINST:

National Motor Goods Co., of St. Louis, Mo., at St. Louis.
Chicago Automobile Supply House of Chicago, Ill., at Chicago.
Iroquois Rubber Company of Buffalo, N. Y., at Buffalo.

The parts sold by these and other concerns are of inferior design, material and construction. They are not efficient and positively injure the magneto and coil upon which they are applied.

Other Suits Pending.

We intend to fight this nefarious practice to the death and respectfully solicit your co-operation. Dealers and users are urged to purchase repair parts for old equipment from authorized Remy Branches and Service Stations, only.

REMY ELECTRIC COMPANY, Anderson, Indiana.

The Comfort Car for 1913

EVERY KisselKar representative is ready to give you every opportunity to convince yourself that the KisselKar is the greatest comfort car in the history of the industry.

No car can equal the KisselKar comfort without equalling the liberal wheelbase—and few cars do.

Few cars have such commodious tonneaus—which give greater distinction and riding comfort.

No other car has equally deep seats, which allow the occupants to lounge back and fully relax without need to brace against lurches or sidesway on rough roads.

The highest priced car built will not equal the rare riding comfort of the KisselKar.

No car can surpass the road capabilities of the KisselKar—the quick get-away—the reserve power to master the extremest road conditions—the ability to slow down "on high" to a creeping pace, and to climb hills at easy speeds without rushing down one hill to get up the next.

In the two great factors of car quality—easy riding and easy driving, the KisselKar is the unmatched car of America.

KISSELKAR SERVICE is supplied by a national service organization maintained by the manufacturers with specially constructed buildings at principal points of America, as service-centers, to cooperate with sales agencies in giving owners the service that lowers running cost, retards depreciation, and insures uninterrupted pleasure.

KISSELKAR SERVICE CENTERS and AGENCIES

BOSTON, NEW YORK, CHICAGO, MILWAUKEE, KANSAS CITY, LOS ANGELES, MINNEAPOLIS, ST. PAUL, DALLAS, Philadelphia, Cleveland, Detroit, El Paso, San Antonio, Omaha, New Orleans, Baltimore, Denver, San Francisco, Butte, Seattle, Portland, Duluth, Buffalo, Pittsburg, Hartford, Ct., New Haven, Albany, Troy, Montreal, Quebec, Toronto, Winnipeg, and 200 other principal points throughout America.

Clear Vision Brougham

Model 42
$3000 F. O. B. Detroit

Isn't Your Line Incomplete without an Electric, Mr. Dealer?

There is a real business opportunity for the right dealer in every town of 10,000 or over in which the Detroit Electric is not now represented.

In its present highly developed state the Detroit Electric, if properly handled by you, means increased business with comparatively little additional overhead expense. We would be glad to give you special information and practical assistance. We desire only permanent connections that will be mutually satisfactory.

Remember that the Detroit line is absolutely complete, including eight models in pleasure cars and a full line of electric trucks. All are made in our own factories and guaranteed by this company, the largest organization in the world devoted exclusively to the manufacture and sale of electrically propelled vehicles.

The new Detroit Electric Clear Vision Brougham, as announced in the October magazines and exhibited at our various branches, has met with the instant approval of the public. We have in the past introduced many notable improvements in the development of the electric automobile, but none has met with more approbation than the Clear Vision features of this car which permit a clear view in all directions—in front, both sides and at the rear.

The seating arrangement of this car is not only unique, but logical for driving in congested traffic. All seats face forward. Note the central location of the forward seats, from one of which the car is driven; and yet there is plenty of room between the front and rear seats. The car has a well-balanced, pleasing appearance whether occupied by one or more persons.

We shall be pleased to hear from live dealers. Our 1913 catalog is now ready.

Deliveries on the 1913 Detroit Electric will be scheduled according to date orders are received.

Anderson Electric Car Co.,

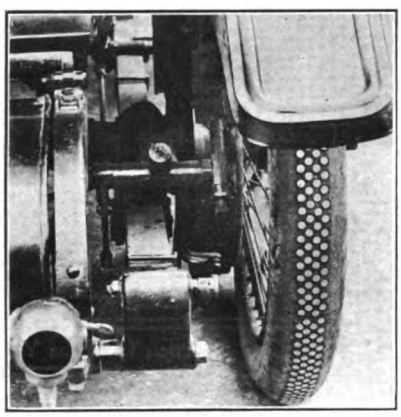
THE AUTOMOBILE JOURNAL

VOL. XXXIV, No. 8 NOVEMBER 25, 1912 Price, $1.00 the Year

AMERICAN INFLUENCE AT OLYMPIA SHOW.

British Makers Meeting Demand for Comfort and Convenience—Neat Appearance of Chassis Components with Strong Tendency Toward Unit Construction—Motor Starting and Electric Lighting—Improved Body Designs.

COMFORT and convenience may be termed the striking characteristics of the machines on display at the 11th annual show of the Society of Motor Manufacturers & Traders at Olympia, London, England, Nov. 8-16. Body design long has been a matter of serious import among British builders, but this year still greater attention has been paid to the subject. While comfort and convenience enter into the consideration of body construction, it is with particular reference to the chassis components and fittings that the application is made in this instance.



Example of English Coachwork as Presented in Inside Driven Limousine by Melhuish & Co., on Hotchkiss Chassis in Olympia Show.

The influence of American practise is more noticeable this year than ever before in a British show. This is aside from the number of American cars on display, although that is larger than at any previous exhibition. The so-called American invasion has had its effect upon the production of models designed to be sold at a figure more nearly approaching what must be asked for those imported from the United States. On the other hand, the dealer who handles cars constructed on this side finds himself at a slight disadvantage in the matter of body design and not a few are having bodies of British make fitted to the imported chassis.

Electric lighting may be said to have secured popular favor in England before its value was fully recognized on this side, but in spite of this the use of the lighting dynamo on cars of all types has not been so marked heretofore. This appears to be a feature as noticeable as it was

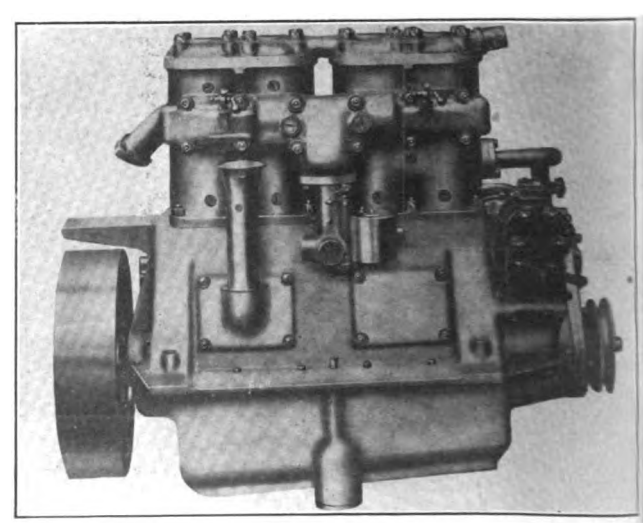
Digitized by Google

during the exhibitions of last winter in this country. Motor starters, concerning which British manufacturers found many reasons why they were not practical earlier in the year, now appear on several machines, and their number seems to be increasing.

English Daimler Underslung Spring Suspension.

Due to the fact that many of the makers relinquished a portion of the space originally allotted to them, in order that the show might be still more representative of the industry as a whole, there were 353 exhibitors. Of these no less than 129 displayed cars. The American makes were: Mitchell, E-M-F and Flanders (both now known as Studebaker in this country), Stanley, Marathon, White, Overland, Ford, R-C-H, Cadillac and Hupmobile. The Stanley was the only exponent of steam in the show.

The exhibition was remarkably representative, not only embracing cars of British, Continental and American manufacture, but all types of vehicles, large and small, low priced and costly, and with engines of two, four, six and even eight cylinders. The same may be held to be true of the accessories division, and as always is the case in foreign shows, much greater attention was paid to the display of coachwork than on this side. This last has particular application to the makers of bodies alone, and is a result of the foreign practise in which one firm produces the chassis and another specializes in bodies to be fitted thereto.

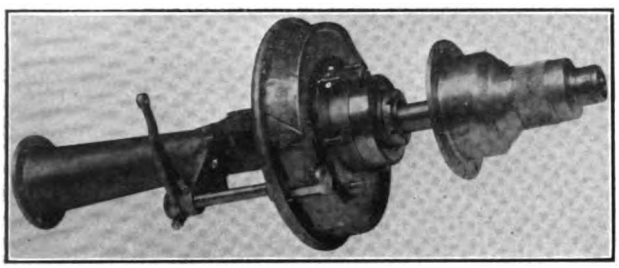


Those who built six-cylinder motors a year ago are doing so again, except perhaps in a very few instances, while those who favored the four-cylinder engine apparently have seen no reason for changing their decision. There are one or two new small six-cylinder machines.

At least one new so-called valveless engine was disclosed, this being the Mors, but complete details have not reached this side. The Knight has been added by a few British and Continental makers. The Itala seems to have held its own. The Argyll has been changed slightly, but in all essential details is the same motor as that which was presented for the first time at the Olympia show of last November. A modification of the original design is shown in the Piccard-Pictet, which also is a single-sleeve engine made under the Argyll patents. Of course, the Darracq must be included in this list.

Many British makers are still convinced that they can produce a poppet valve motor which will be as quiet running as any of the newer types, and they appear to have succeeded remarkably well in this undertaking, judging from the reports of demonstrations reaching America. A notable trend of design is toward the monobloc casting, in which the motor, flywheel and transmission housing are presented as a unit. The 15 horsepower Crossley power plant, reproduced herewith, may be cited as a striking example of this construction.

The long stroke situation does not appear to differ materially from that disclosed a year ago. For the most part the ratio is about two to one, although in some instances this has been carried still further. Ignition and cooling have not changed perceptibly. Water proof magnetos are found on many machines, and fixed ignition is another growing tendency. Thermo-syphon cooling is meeting with favor. Lubrication systems remain about the same, although there are more small engines provided with hollow crankshafts through which the oil is forced under pressure to the big end bearings than formerly.



Clutches show few radical changes. The leather faced cone still holds its own, while the multiple disc also has many adherents. An accompanying sketch presents the method employed for withdrawing the leather faced cone member of the English made Germain-Knight

Latest Type of Argyll Single-Sleeve Valve Motor.

Digitized by Google

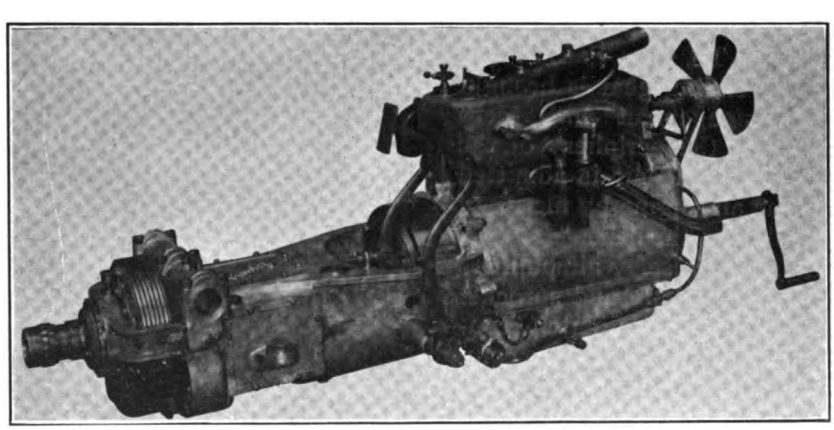
which presents a somewhat new idea. It will be noted that the withdrawing sleeve is mounted on four rows of ball bearings, two of which are

Crossley Detachable Wheel Assembly Illustrating General British Practise.

shown in the drawing as presented.

As to the shaft conveying the power from the clutch to the transmission, efforts are being made to simplify matters in this direction, and at least one firm is fitting what is termed a new form of spring drive, which appears to be nothing more or less than a friction transmission, such as has been successful on several American cars for years. The four-speed gearbox is meeting with very general favor, and this year it appears on a number of low powered chassis.

As far as the pleasure cars are concerned it would appear that the worm drive is not gaining. The bevel drive still predominates, and some makers seem so undecided that they are offering an option of either worm or bevel. With those who utilize the former there is much question as to which is the better placing of the worm—under or over the wheel—although it may be stated that fully 75 per cent. of the worms are underneath.

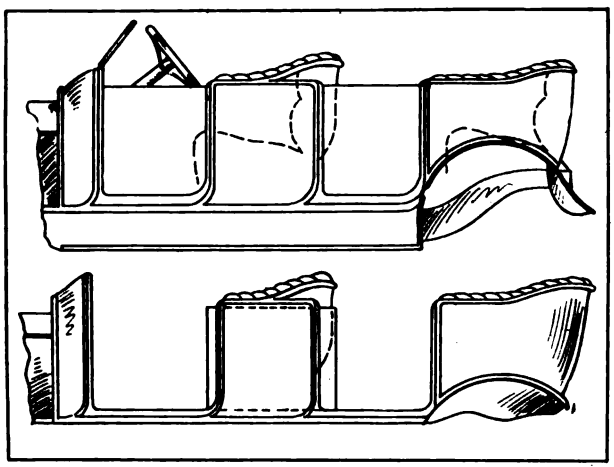


The use of underslung springs is growing slightly in favor. The design employed by the English Daimler is presented herewith, and it will be noted that two spring clips are placed diagonally, instead of the more usual parallel system. For the most part springs are long and wide, with little camber so as to present a flat appearance when loaded.

Among the special features in construction may be mentioned the provisions for detachable wheels on the Crossley, shown in an accompanying illustration. Rudge-Whitworth wire wheels are furnished as standard, but detachable wood wheels can be supplied at the same price. Such equipment is very general on British cars, although many makers are supplying demountable or detachable rims.

Two interesting details are noted in the Chenard-Walcker, both being presented in the sketches. The combined inlet and exhaust manifold adds to the neat appearance of the monobloc motor casting, and is expected to aid in more efficient carburetion because the mixture is warmed by the exhaust gases on its way to the combustion chamber. The utilization of the scuttle dash as a fuel container also is new, as well as the location of a reserve oil tank on the dash under the hood, its function being to replenish the supply in the crankcase automatically.

Still another method of working out the unit construction idea is indicated by the drawing of the water pump and gear driven fan on the S. P. A. In this chassis the engine, four-speed gearbox, flywheel, clutch, etc., comprise a unit mounted on a cast aluminum base with three point suspension. In addition the water pump is cast integral with the forward end of the cylinder casting, and the driving pinion for the fan is encased with and driven from the main timing gear.



Concerning motor starters, the British manufacturers seem to be only just beginning to give the matter serious consideration. But very few appear to be offering these devices as regular equipment, while the others list them as an option. This undoubtedly is another result of American influence, since the self-starting Cadillac and White have gained wide popularity in Great Britain during the past few months. Both of these machines are fitted with combined elec-

Crossley Power Plant Unit, an Example of British Monobloc Design as Revealed at Olympia.

tric starting and lighting equipment, and the English concerns which have followed their example, notably the Crossley and Lanchester, ap-

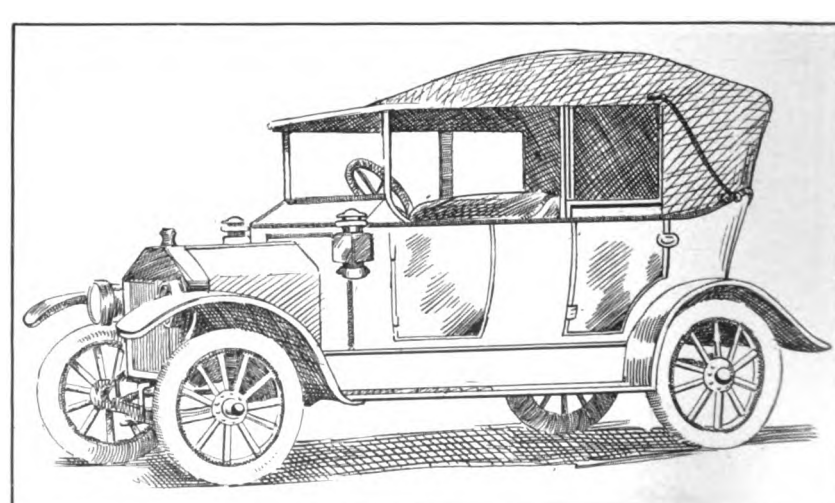
Digitized by Google

Sliding Door Feature, Revealed by Brainsby & Sons at Olympia Display.

pear to have adopted a similar arrangement, judging from the reports that have reached this country thus far.

The Adams was the first machine to utilize a motor starter and this was on the compressed air principle. The Wolseley and Sunbeam have adopted this type. Accompanying sketches bring out the details in the two last named systems, and it will be noted that they differ materially from those in use in America.

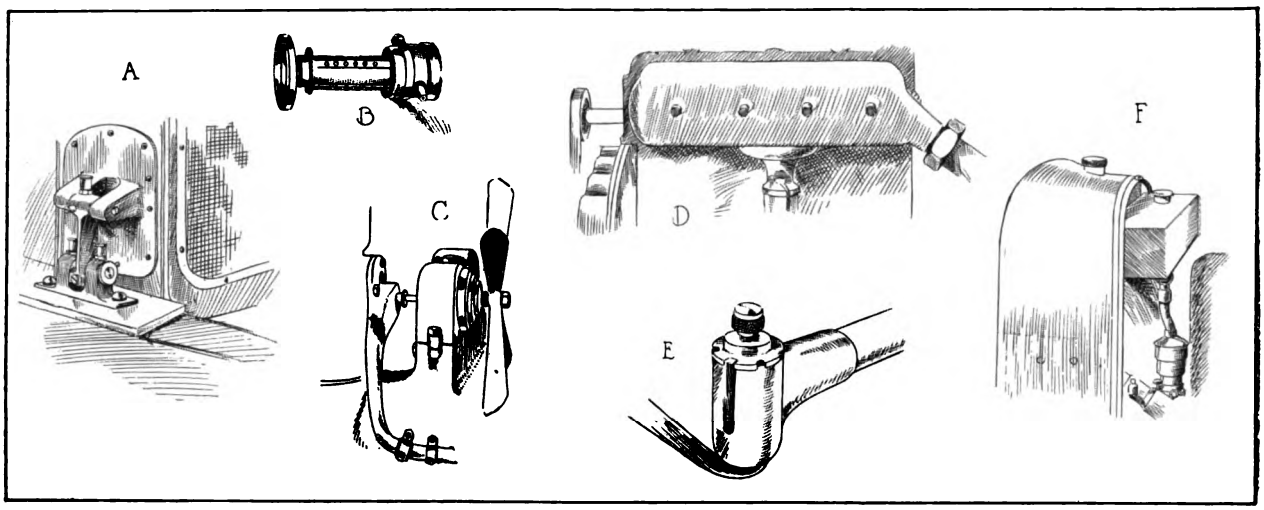
In the Sunbeam the air compressor is fitted with the lid to the gearbox as a base, and a gear wheel on the compressor shaft meshes with one of the transmission gears, a rod being provided for throwing these gears into and out of engagement. Air is conveyed by suitable tubing to the air engine on the side of the main power plant. The engine consists of three cylinders and six poppet valves operated by the regulation camshaft. To start the car motor, a sliding gear is brought into engagement with teeth cut on the periphery of the flywheel, and air is admitted to the air engine by means of a valve on the dash.



The Wolseley air pump is driven by chain and sprocket provided with a clutch coupled to the layshaft. The compressor has two vertical cylinders with a pair of outlet and twin delivery valves, and a non-return outlet valve in the air delivery pipe. The distributor has four cams, which lift the distributing valves through tapered fingers, these latter being withdrawn except when the distributor is moved into the starting position. Normally, the pump is out of engagement, depending upon the pressure in the storage tank. A starting lever on the dash throws the tappet levers into position between the starting cams and valve stems, this being combined with a motion which opens the air admission valve.

The Star is utilizing the Ever Ready starting system, a spring device made in this country.

Among the new body designs presented are several inside driven limousines, in which so-called arm chair seats are arranged so as to face forward, backward or sidewise at the will of the occupant. Frameless glass windows are another noticeable feature. An accompanying illustration shows one of these bodies, the work of Melhuish & Co., fitted to a Hotchkiss chassis. In this the driving seat is adjustable and the rear end of the body can be detached from the front portion. It may be cited as an excellent example of this type of coachwork, although the treatment is slightly different with other houses.



The cabriolet body fitted to a Ford chassis shown herewith, is the work of Offord & Sons. The hood is of pantasote and is made without side joints. The frameless glass windows are utilized in this instance. The weight is but 56 pounds more than the ordinary four-passenger body furnished with Ford cars, and Americans will have little trouble in agreeing with the British that this is a particularly handsome design.

Several special features, which may be regarded as novelties that have not been fully tried out, are presented, and it will be necessary to call attention to but a very few of these. Accom-

panying sketches are intended to convey the idea brought out by Brainsby & Sons with the sliding door model. In this the front and rear doors slide behind each other, and provision is said to have been made for the entire elimination of rattle. Another novelty, not shown, is the use of a door in the scuttle dash on the Vauxhall limousine, which encloses a folding seat for the mechanician. This is the work of Mulliner, Ltd.

In summing up the body situation, it may be stated that more attention is being paid to the matter of adjusting seats in all cars to individual needs, while protection from the elements in touring cars has been studied carefully. Silence undoubtedly characterizes the majority of the new models, and real efforts have been made in respect to supplying double purpose bodies which are both tasteful in outline and practical in application.

As stated previously, the matter of body design always has been considered of rather more moment in Great Britain than in this country, but even the British motorists are forced to concede that by no means the same attention to detail has been exemplified in previous exhibitions. There appears to have been a real and successful attempt to blend the coachwork with that of the chassis. The dash and bonnet are made to merge harmoniously, and the same graceful contour is found throughout the entire assembly. Still another feature is the fitting of seats capable of being adjusted to individual needs, and protection from the elements in touring cars is a matter that is being given particular attention.

PROTECTING THE MOTORIST IN WINTER.

Convertible Bodies, Combining Qualities of Touring and Enclosed Types, Make for Convenience---Heating Devices, Their Method of Application and Operation.

NOW that a majority of owners use their automobiles the greater portion of the year, and many without regard to weather conditions, no matter what the season, the protection afforded by the enclosed body is superior to all others. By the term enclosed is not necessarily meant the coupe, berline or limousine, but rather the type that will protect the passengers and operator as well from dust, mud, rain, wind, cold or other condition that can be avoided. With cars being used for more extended travel each year the manufacturer is providing comforts and conveniences obtainable with other forms of modern transportation.

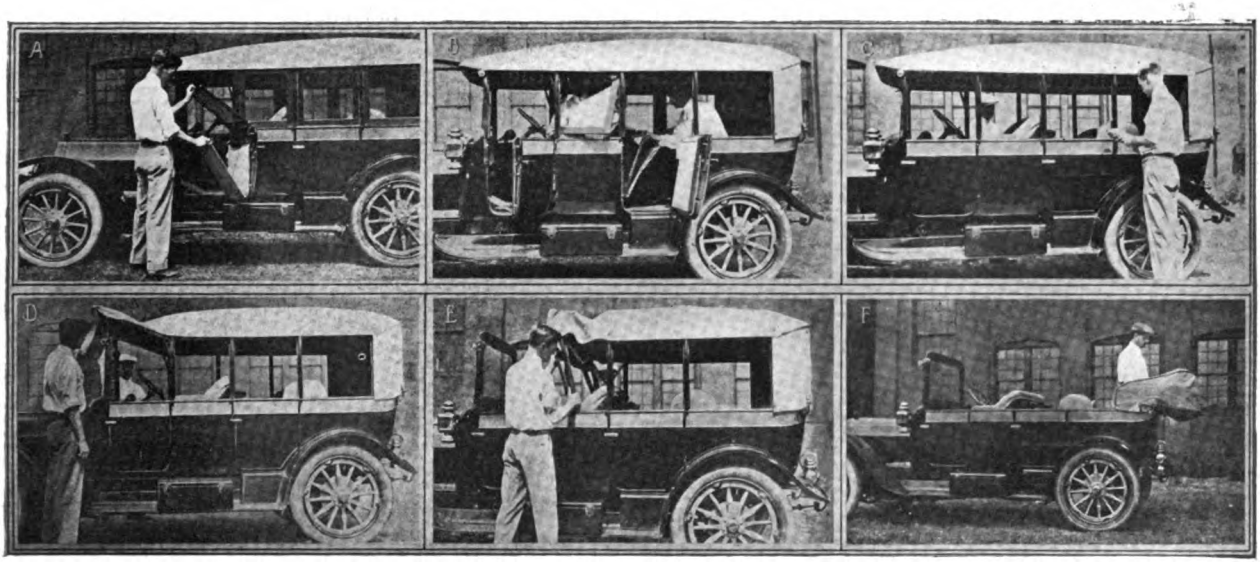
The designers of bodies have made wonderful progress since the days of the rear entrance to the tonneau. The side door types have been improved by the adoption of the torpedo with smooth sides and wind resisting lines, which construction has been refined to a remarkable degree. The development of the convertible body, a practical type providing the comforts of the limousine without detracting from the conveniences of the touring design, has made possible the utilization of one chassis the entire year without alteration of springs, etc. The weight is but a little more than the usual fore door type, and it will appeal particularly to the motorist maintaining but one machine, because of the convenience made possible through the combinations that are afforded so easily and quickly.

Enclosed and Convertible Bodies Make for Comfort in Motoring During Cold Weather.

The very general adoption of the fore door and enclosed bodies has brought about a change in the position of the control levers, the gate or quadrant being placed within the body at the right of the driver or in the centre, the mounting depending upon the design. With this situation the equipping of the chassis with the convertible body is simplified.

Convertible Designs.

A body of the convertible type and one that is the result of development extending over a period of several years is the product of the Springfield Metal Body Company, Springfield, Mass., shown in accompanying illustrations. While this normally is in appearance an open touring equipment of conventional design, it may be converted into an entirely enclosed body suited for service under all conditions of weather and temperatures, the combinations being secured without sacrificing any desired quality of either type, and the changes may be made in a very few minutes.



With the body open there is a folded top carried under a dust cover and a windshield mounted on the scuttle dash. There is no abnormal appearance or unsightly projection to call attention to the fact that the body can be entirely enclosed with glass windows. With the top raised, access is not impeded nor is the vision obstructed, and

Digitized by Google

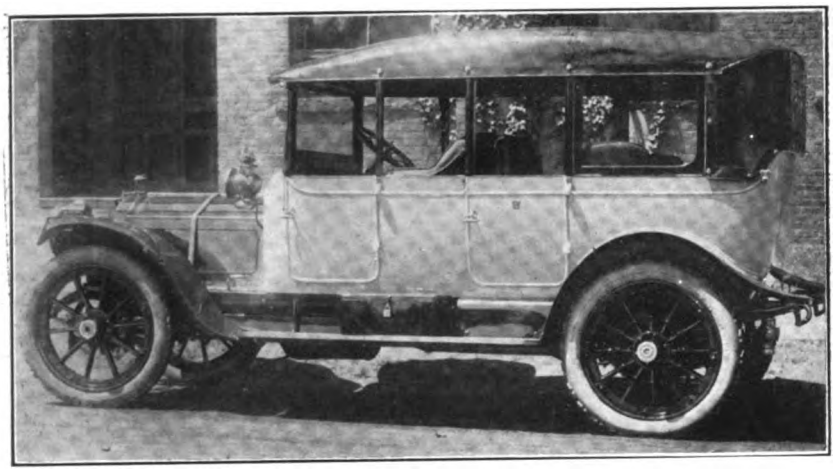
the maker points out that the elimination of buttoned side curtains makes for convenience of the passengers, as does the use of straight side supports instead of bows at varying angles.

Removable Windows.

The windshield is not divided and has a heavy frame while the body has the usual side doors for the front and rear seats, not unlike those of the average enclosed car with drop door windows. In these doors, concealed by heavy padding, are recesses into which the windows fold and are covered by leather flaps which button down. When the windows are raised they are spring retained. At the back of the front seat is a receptacle for the windows in their frames, and the pocket is utilized when the equipment is used in its open form, in warm weather, for instance.

Illustrating the Process of Converting the Springfield Metal Body from Enclosed Into Touring Type: A, Folding the Windows Into Position; B, Storing Windows in Receptacle Back of Front Seats; C, Loosening Retaining Screws; D, Unlocking Front Horizontal Bows; E, Carrying Back the Bows; F, the Work Completed.

The construction is best explained by the process of converting from the enclosed form into the open or touring type, the operation being shown in the accompanying illustrations. The door is opened to a right angle position and held with one hand while the flap is unbuttoned, the window raised and folded down and the flap secured at the top. The windows proper are next removed by unscrewing the ball handled knobs sufficiently to allow the frames to be lifted out, after which they are placed in the receptacle on the back of the front seats.



Folding Top.

After the back curtains are unbuttoned three screws on each side of the body are loosened with a wrench provided for this purpose, and the catches holding the front horizontal bows to the glass front on each side are unlocked by pressing upward on projecting levers. The front horizontal bow is swung up until it unlocks the front vertical member. The inner end of the first named bow is then swung down parallel with the vertical member and entered into a projecting lug in a locking hole. Between each pair of bows is a concealed joint which is broken so that it will fold down easily when carrying the bows back. The front bows are then carried back and the others in order, entering the lowest one in the fastening studs first and each succeeding bow on top of it, after which the holding screws are tightened and the slip cover placed in position.

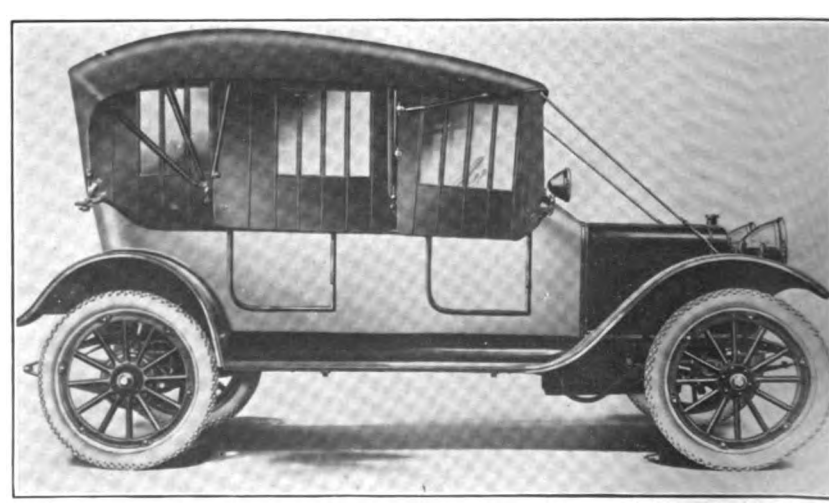
It is obvious that the construction makes for convenience, as with the top raised it is a simple matter to take the windows from their receptacle and place them in their openings should their service be desired. With the windows in position the entire body, with seven passengers, perhaps, may be enclosed so as to give the best of protection against the cold or rain and the occupants may leave the car or enter it at will through the doors. The windshield swings from the top in its frame and affords any degree of ventilation. It may be cleared of accumulations of water or snow by the use of a scraper.

The designer points out that the fabric top does not serve as a sounding board and conversation may be carried on without inconvenience in ordinary tones. All joints are screw retained, eliminating opportunity of rattling and the up-

Digitized by Google

Design of Convertible Body Made by the Springfield Metal Body Company, Having Glass Enclosed Top When Raised to Cover Touring Body—Entrance Is as Convenient as to a Limousine.

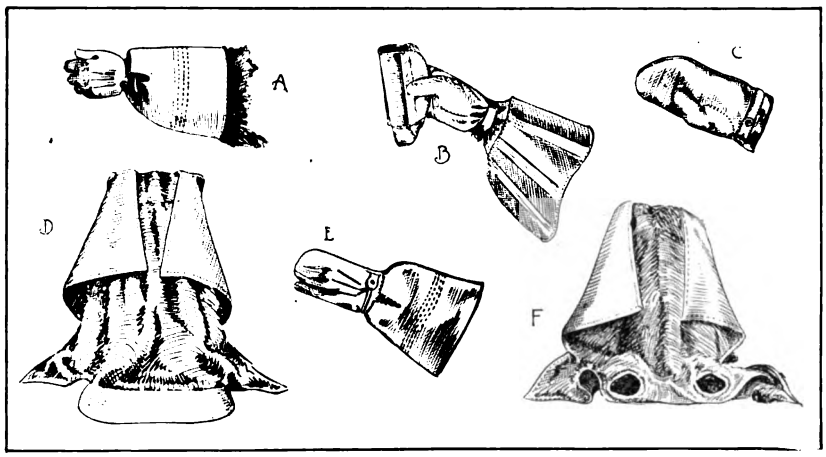
holstery is in keeping with the comfortable design. The bodies are constructed both for touring and roadster cars and can be made to fit almost any standard chassis of modern manufacture.



Curtain Devices.

The ingenuity of the top manufacturer has solved one of the vexing problems of side curtains, which form means of protecting the occupants of the car from chilling winds or the weather. These members when fitted properly exclude the cold, but the entrance and egress of the passengers is restricted in that sections of the curtains must be unbuttoned or detached. When not fitted to the top they are stored under the seat or in some other convenient place, and adjusting them to position requires time.

These conditions have been overcome in the Jiffy curtains, made by the Jiffy Auto Curtain Company, Detroit, which are standard equipment on several 1913 models. Instead of being carried under the seat the Jiffy curtains are in the top in sections, three to each side, and are retained when not in service by straps. They are strung on rust proof wires at the side of the body and each section overlaps the other, just enough to make the car weather proof, irrespective of the direction of the wind or rain. Snap buttons are utilized to join the sections, and each is secured to the outside of the body on adjustable wires. When a passenger desires to leave the car the curtain is slid and compressed. As they depend from steel cables and are swung inward and upward, they are concealed from view and fold easily with the top. Vertical windows are provided and so fitted that they do not interfere with the operation of the curtains.



For the motorist whose chassis is not equipped with an enclosed or convertible type of body, the manufacturer has provided ingenious robes, as well as wearing apparel, which contribute to comfort in winter driving. Those who have experienced the difficulty of arranging the robe to exclude draughts and at the same time permit of easy access to the clutch and brake pedals will appreciate the Burlington Sho-Fur mat robe, made by the Burlington Blanket Company, Burlington, Wis. It is provided with two pockets for the feet as shown in an accompanying illustration, the arrangement permitting freedom of operation.

Another design made by the same company and produced in individual or dual form, comprises a mat to which is secured the robe. The former prevents the cold from reaching the feet and ankles of the passengers and makes it a simple matter to arrange the robe in such manner as to exclude the cold. The design also dispenses with the annoyance of uncovering anyone except the person who desires to leave the ma-

Jiffy Curtains Incorporated in the Top Make Easy Entrance and Exit of Passengers and Are Weather Proof.

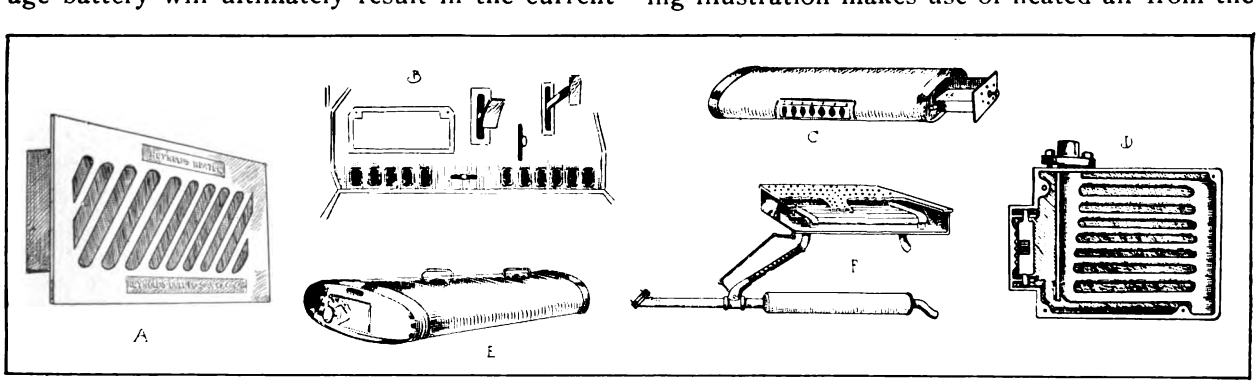
New Designs of Gloves and Robes for Winter Motoring: A, Grinnell Special; B, Gloversville Gauntlet; C, Miller Auto Mitt; D, Burlington Mat Robe; E, Grinnell Mitt; F, Burlington Sho-Fur Robe.

chine, a convenient detail in construction.

In the matter of gloves the maker has added many refinements making for durability, as well as warmth. Double palms, seamless construction under the thumb, special fastenings and cuffs are noticeable of the new designs. Many new styles of motoring coats and ulsters are being shown and one is provided with a patent fold so placed under the arms as to permit raising these members without pulling up the body of the garment.

Heating Devices.

When the many refinements and conveniences of the modern car are considered it is surprising to note that more attention has not been paid to the heating problem. Although there are several devices utilizing the heat from the exhaust gases of the motor, circulating system, or fuels, it is noticeable that but little progress has been made in the application of electricity. It is only reasonable to presume that perfecting the dynamo for lighting purposes and for charging the storage battery will ultimately result in the current being employed to heat the car, the problem involving the output of the generator and resistance of the device.



The marketing of an electrical device termed the Warm Hand Wheel by the Warm Hand Steering Wheel Company of New York City, is indicative of what may be expected in the near future. It comprises a rim adapted to replace the usual member and carries coils of wire heated by the storage battery, generator or other source of current. The maker states it will protect the driver's hands in the coldest of weather and that it is economical of current.

Another electrical device is noted in the patent of Earl D. Shannon of Alpena, Mich. The rim of the steering wheel is hollow and contains a number of lamps heated by electricity. An interesting feature is that the resistance members are so constructed that they may be moved toward and from one another to vary the zone to be heated and its temperature.

Utilizing Heat of the Motor.

The utilization of the heat from the motor is, perhaps, one of the simplest forms and one car manufacturer has provided the dash with a series of openings, these being fitted with shutters so that they may be closed when heat is not desired. A baffle plate is employed so that grease cannot be thrown by the revolving parts of motor through the openings. This principle has been applied by many owners, it being a simple matter to incorporate a ventilating shutter in the dash and fit a partition in the pan or undershield.

The Reynolds heater shown in an accompanying illustration makes use of heated air from the

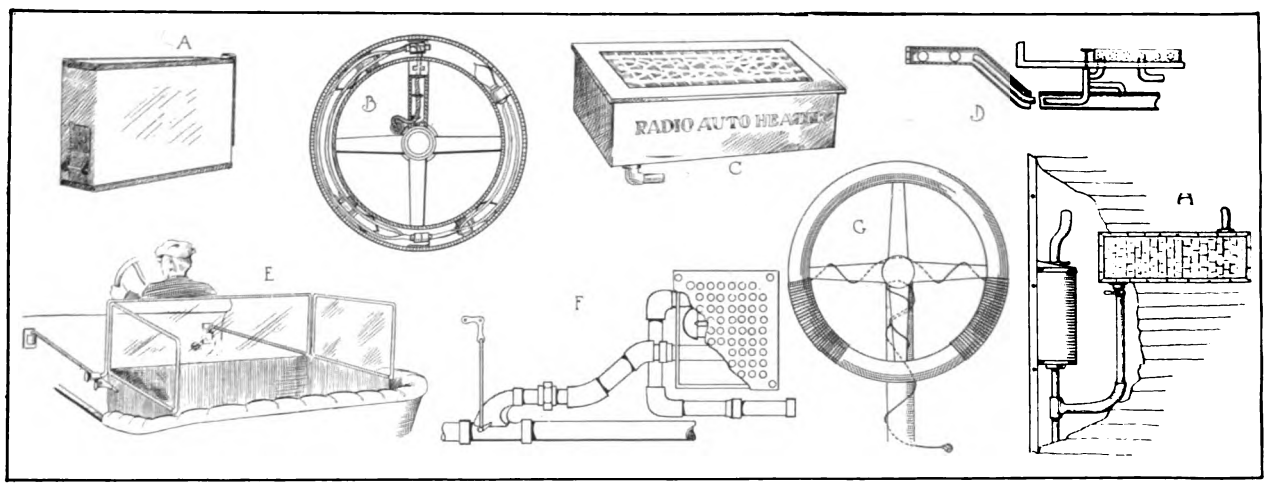
Digitized by Google

power plant and is installed by cutting a hole in the footboard for the reception of the casing, which is similar to the furnace register utilized in heating the house. It comprises three parts, the shutter, body and face, and a quality claimed of it is that fresh, pure air is drawn into the car and the interior heated. Control is by the shutter member and the construction is such that the oil or grease from revolving parts cannot find its way through the grating. The heater is compact, being but two inches deep, and its other dimensions vary according to the size of the car, the largest casing being five by 16 inches.

Fuel Heaters.



An early form of heater and one that was first applied to the horse drawn vehicle is that represented by the Clark and the Lehman, made by the Chicago Flexible Shaft Company, Chicago, and Lehman Bros., New York City, respectively. These employ an especially prepared fuel in the form of bricks or cakes, which are ignited and placed in a drawer lined with asbestos or other suitable fireproof material. The combustion is very slow and it is claimed that one brickette will burn 12 to 16 hours. End and side ventilators are provided for the radiation of the heat and adjustable shutters permit of control. The construction is of heavy galvanized metal with polished brass ends and the number of drawers for the fuel vary with the design. Covered with velvet carriage carpet in colors to match the upholstery, and in styles to meet individual requirements, the heater does not detract from the appearance of the car.

When it is considered that the greater part of the heat units of the gasoline employed to operate the motor are wasted through the cooling jackets and exhaust, it is not surprising that the majority of heating devices now being marketed utilize these products. The application is simple, a part of the gases being intercepted and led to coils or a radiator conveniently located in the body. One of this type is the Radio Auto Heater, marketed by the Milwaukee Auto Specialty Company, Milwaukee, Wis., and shown in an accompanying illustration. The heater is a solid casting placed inside a sheet steel box with grilled nickel plated cover. The exhaust gases are led to the heating member and a valve is incorporated for control.

Radiator Construction.

The A1-Ton heater, manufactured by the Atlas Ball Company, Philadelphia, utilizes practically the same principle, and provision is made for a free outlet of the gases used. The radiator is installed flush with the floor and has a polished aluminum face. The gases are led from the exhaust pipe, being taken midway between the motor and muffler through a valve member which is controlled by a rod conveniently located. Light gauge copper tubes are utilized in the heater, the maker holding that greater radiation is thus possible and that there is over 200 square inches of heating surface. The connection between the valve and radiator is by flexible metal tubing, a construction making for easy installation.

The heating device marketed by the American Auto-Heater Company, New York City, employs the exhaust gases, these being carried to

Tonneau Windshield; F, Register and Connections of American Heater; G, Warm Hand Steering Wheel Heated by Electricity; H, Application of Garrison Device.

Digitized by Google

the aluminum heater located in the floor of the car. The device is 10 inches square and three deep, and the amount of heat is regulated by a valve operated by the driver. The heat is radiated by a series of coils, one end being connected to the exhaust pipe while the other is provided with a miniature muffler, which is utilized to carry off all odor, dust, etc., and to minimize sound. The heater is easily operated, the lifting of the valve member permitting the flow of gases, while its release closes the shutter and the heater cools off.

The Garrison heater, made by M. H. Garrison, Philadelphia, is adaptable to any type of body, although it was designed particularly for the enclosed car. It is made in three styles, for the right, left or the floor of the machine at the front. With the last it may be raised to permit of access to the mechanism of the car without disconnecting. The installation is a simple matter, the heater fitting the floor of the car in a space measuring seven by 22 inches, the heat being regulated by a two-way valve, which may be turned on or off as desired. Seamless tubing is utilized to connect the heater with the exhaust pipe.

Ventilating by Fresh Air.

Three forms of Reid heaters are produced by the Motor & Manufacturing Works Company, Dunkirk, N. Y. Two are designed to be placed in the floor of the body, while the third is vertically positioned. The floor type is operated either by foot or lever placed in some convenient position on the car body, while the vertical is by hand lever only. The heater proper consists of a radiator placed inside a box the cover of which is provided with hot and cold air openings. As the hot air rises, cold air enters on the underside of the radiator and passes upwards between the coils. When this is heated it is replaced by a further supply of cold air. The radiator casing being air tight on the bottom prevents the entrance of dust or odor. Control of the heat is by a valve on the exhaust pipe between the engine and the muffler. Connection is by a flexible tube. The radiator comprises a series of parallel tubes terminating in a manifold at each end, and the intake is tapered with the large end toward the exhaust, to obtain a uniformity of gas through each coil. The valve is of the clamping construction and is held upon its seat by a spring.

Another form, a patent for which was granted recently, is the Ruffier, in which a tubing is incorporated in the exhaust pipe for the purpose of conducting the gases to a radiator in the floor of the car body. Control of the gases is by a shut-off valve.

Water Heaters.

The James Thermos device utilizes heated water and in addition to providing heat for the occupants of the machine it is designed to prevent freezing of the water when the car is not being operated. It comprises a small gas burner located on the running board, the gas being taken from a small pressure tank on the machine. A pilot light burns in the base of the brass housing and upon the burner is a coil through which the cold water circulates, being heated with the current of the circulating system at its lowest point so that the circulation is kept constant.

Garage Heaters.

The Scientific heater is designed for heating the garage and gas is employed. It is constructed on the principle of the miner's safety lamp and cannot explode or ignite fumes of gasoline. It heats by the system of air rotation and is intended for small individual garages not provided with other heating means. It is manufactured by the Scientific Garage Heater Company, Cleveland, O.

Another device for preventing the freezing of the car stored in cold garage is the Neverout, made by the Rose Manufacturing Company, Philadelphia. It comprises a burner which is connected with the city gas supply by a flexible metal pipe, and two rubber tubes. One is inserted in the radiator while the other is attached to the petcock under the radiator. The heat of the burner automatically keeps the water circulating through the system at any desired temperature. The flame is surrounded by a safety screen. The heater is easily applied and removed.

No attempt has been made to describe all of the heating devices, but rather to outline some of those now being marketed and define their principle of operation. With enclosed and convertible bodies, proper wearing apparel and means for heating the car, the discomforts of motoring in cold weather are reduced to a minimum.

CHICAGO'S NEW ORDINANCE.

Because a Chicago motorist raised the point that operators of automobiles were discriminated against in the recent ordinance requiring all motor vehicles to come to a full stop 10 feet away from a street car that halts at any street intersection, the city officials have amended the ordinance so as to include vehicles of all types.

DIAMOND TIRES IN MOVING PICTURES.

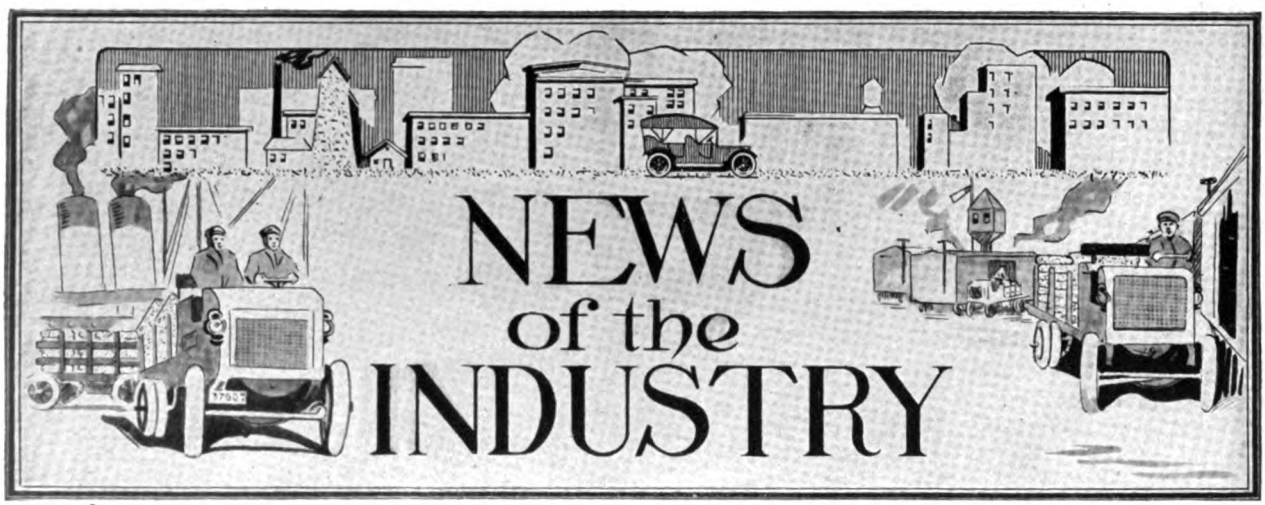
A new use for moving pictures has been discovered by C. S. Thompson, advertising manager of the Diamond Rubber Company, Akron, O., maker of Diamond tires. The scheme was a novel one. In order to demonstrate the efficiency of the Diamond safety tread tire, sprinkling wagons wet the pavement for a block and around the corner into the next block in Akron. After the street had been made slippery, an automobile with smooth tread tires made the run at 30 miles an hour. The car skidded almost twice around while the moving picture man took pictures of the vehicle. A second machine, equipped with Diamond safety tread tires made the turn at the same high speed, negotiating the corner without the least skid. The picture machine recorded this feat also. A second test was made by putting on the brakes hard while the cars were travelling 30 miles an hour straightaway. The car with plain tread tires skidded around to an about-face position, but the safety tread tires on the second car held and brought the machine to a sudden stop in three or four feet.

CADILLAC LOWERS ANOTHER RECORD.

Driving the same Cadillac car with which he won second place in the Los Angeles-Phoenix race a short time ago, Charles Soules, the well known California racing driver, succeeded in lowering the Los Angeles-San Francisco record by the island or valley route a few days later, setting a new mark of 17:05:00 for the distance of almost 500 miles. The former mark of 17:45:00 was held by T. J. Baudette, who also drove a Cadillac car over this route about a year ago. Arthur Morris acted as mechanician for Soules in the record breaking drive, during which no trouble of any kind was experienced with the car.

INDIANA ROADS CONVENTION.

The Indiana better roads convention will be held at the German House, Indianapolis, Ind., Dec. 11-13, and more than 7000 invitations have been sent out to township trustees, county auditors, boards of commissioners, county surveyors and commercial organizations, asking each to name 10 delegates to the convention. More than 500 delegates have been appointed. Special invitations have been extended to bankers, state legislators and public officials. Prominent men interested in highway improvement who have consented to speak include: Judge J. M. Lowe of Kansas City, Mo., president of the Old Trails Ocean-to-Ocean Highway Association; Jesse Taylor of Jamestown, O., president of the Ohio Good Roads Federation and editor of Better Roads; Logan Waller Page of Washington, director of the office of public roads; D. Ward King of Missouri, inventor of the split log drag and recognized authority on road maintenance; Charles P. Light of the American Highway Association; Joshua Strange of Marion, Ind., president of the State Farmer's Congress, and A. G. Batchelder of New York City, representing the American Automobile Association.



COMPLETES LONG TRIP.

Ray Harroun, formerly one of the most noted racing drivers in the country, winner of the first 500-mile International sweepstakes race, and now a member of the engineering staff of the Nordyke & Marmon Company, Indianapolis, Ind., maker of Marmon cars, recently completed a 2000-mile trip in a Marmon "six" touring car. Mr. Harroun made light of his journey, saying: "A trip covering 2000 miles in about two weeks would have been considered extraordinary a few years ago. At that time it would have been necessary to provide all sorts of special equipment before starting. But as manufacturers have reached the point where their cars represent additional comfort and luxury as well as capability, 2000 miles is hardly above the commonplace."

PEERLESS HANDLING CHEMICALS.

Baugh & Sons Company, Philadelphia, Penn., manufacturing chemist, has been operating five Peerless trucks, made by the Peerless Motor Car Company, Cleveland, O., and report that it has profited by practically every advantage that is claimed for motor truck service. Four of the trucks are of three tons capacity and are used to collect raw material about the city and deliver it at the Baugh plant. The fifth truck, which carries five tons, is used to transport the completed products from the plant to the various railroad stations and the wharves. Snow, slush and slippery hills, which are dangerous to horses, have given the vehicles no trouble. Very hot weather has not decreased the efficiency of the service. As the trucks can work overtime when necessary the system is elastic and a saving is effected in every branch of the work.

ATLANTA'S AUTOMOBILE SHOW.

First Southern Display of New Models Makes Record for Sales and Attendance.

Within a few minutes after the doors were opened for the second annual show of the Atlanta Automobile & Accessory Association, in Atlanta, Ga., Nov. 16-23, a sale was recorded at the booth of the Velie Motor Vehicle Company. This proved to be an indication of the business to be transacted throughout the week. Both in the matter of attendance and sales the exhibition made a new record for the South.

The show was under the management of a special committee, of which Wylie West was chairman. The decorations were particularly pleasing, the effect being that of a woodland scene, in which all types of vehicles, gasoline and electric pleasure and commercial, were disposed to the best advantage. The list of accessories, supplies, etc., included the Ragan motor, an entirely new design, described by its inventor, Ralph Ragan of Atlanta, as being neither a poppet valve nor a sleeve valve. Full details will be awaited with interest. The list of exhibitors follows:

Cars—Michigan Georgia Motor Car Company, Michigan; Southern Dorris Company, Dorris; Buick Motor Car Company, Buick; Johnson Motor Car Company, Stevens-Duryea; L. S. Crane, Pope-Hartford pleasure and commercial; Velie Motor Vehicle Company, Velie pleasure and commercial; Premier Motor Sales Company, Premier, Baker electrics; H. B. Odell, Packard, Regal, Rauch & Lang electrics; R-C-H Corporation, R-C-H, Hupp-Yeats electric; Studebaker Corporation, Studebaker; J. I. Case Company, Case; Cole Motor Company, Cole, Federal trucks, Alco trucks; Fulton Auto Supply Company, Hudson, Peerless pleasure and commercial, Marmon; Steinhauser & Wright, Cadillac; Locomobile Company of America, Locomobile; International Harvester Company, International trucks; Sigma Engineering Company, Lozier, Haynes, Corbitt, Standard electrics; Firestone-Columbus Southern Company, Firestone-Columbus; Atlanta Auto Sales Company, Henderson, National, Flanders, Colonial electric; Overland Southern Motor Car Company, Overland, Garford; F. B. Stearns Company, Stearns-Knight; John M. Smith, Pierce-Arrow pleasure and commercial, Chalmers; Oakland Motor Company, Oakland; Mitchell Lewis Motor Company, Mitchell; Ford Motor Company, Ford; American Company, American.

Miscellaneous—Wayne Oil Tank & Pump Company, tanks and pumps; Seaton Spring Wheel Company, Seaton spring wheels; Frederic W. Brown, spring wheels; Whitman Auto Sales Company, accessories; Motor Supplies Company, accessories and supplies; Reed Oil Company, Reed oils; Chas. E. Miller, accessories and supplies; R. J. Slear, Vesta electric supplies; Elyea Austell Company, accessories and supplies; Alexander-Sewald, accessories and supplies; Atlanta Top & Trimming Company, tops and upholstery; Johnson-Gewinner Company, accessories, supplies, motor apparel and novelties; the Gewinner Company, accessories and supplies.

MANUFACTURERS MEET IN DETROIT.

Railroad Men Confer with Them Concerning More Satisfactory Traffic Conditions.

Among the many important matters which came before the meeting af the National Association of Automobile Manufacturers in Detroit, Nov. 13-15, none appears to have been more critical than the traffic situation. It was pointed out that this industry, which requires specially constructed freight cars to handle its product, has only about 50,000 to draw upon while others have 3,000,000. Representatives of 16 of the large railroads of the country met with the motor car makers in a discussion of the problem, and two suggestions were made looking toward a partial solution—prompt unloading of consignments by dealers and greater efficiency in handling empty cars by the railroads. When these conditions are observed properly it is anticipated there will be little delay in the filling of orders.

The question of freight tariffs, unreasonable legislation and federal registration of motor ve-

Digitized by Google

hicles were discussed at some length. The association decided to continue its support of racing and touring contests and to co-operate with the American Automobile Association along lines somewhat different than in the past. As a result of this decision the Motor Contest Association will pass out of existence Jan. 1.

Two matters of importance to the commercial vehicle end of the industry were made the subject of resolutions passed by the executive committee. One of these provides for standard body weight allowances, so that they will represent approximate average weights for all styles of bodies commonly fitted to chassis of the different load capacities, and the other revises the charges for demonstrations, on the basis of 25 per cent. over actual operating expenses. The new schedules will be found in the following tabulation:

Truck size	Body weight, pounds	Daily charge, demonstration
1000-pound	600	$10.00
1500-pound	750	.....
One-ton	....	10.00
1.5-ton	....	11.50
Two-ton	....	13.00
2.5-ton	1350	14.00
Three-ton	1600	15.00
3.5-ton	1600	16.00
Four-ton	1700	17.00
4.5-ton	....	18.00
Five-ton	1800	19.00
Six-ton	1900	20.50
Seven-ton	2000	22.00
Eight-ton	....	23.00
Nine-ton	....	24.00
Ten-ton	2300	25.00

The following were admitted to membership in the association: August Becker, for the Lippard-Stewart Motor Car Company, Buffalo, N. Y.; P. D. Wagoner, for the General Vehicle Company, Long Island City, N. Y., and Horace S. Diller, for the Lauth-Juergens Motor Car Company, Fremont, O. The chief social feature of the meeting was the banquet in the Hotel Pontchartrain, at which about 200 were present.

TAKES OVER OLIVER TRUCK.

New Concern Formed in Detroit to Continue the Manufacture of This Line.

The Oliver Motor Truck Company was recently organized at Detroit and has purchased all material, blue prints, patterns, jigs and dies, together with patents and all future rights of manufacture of Oliver cars from the receiver of the Oliver Motor Car Company, Detroit. Gus A. Meyer is president and general manager, while Fred J. Meyer is treasurer of the new company. Both are Detroit business men. The organization of the sales department is being intrusted to Ray F. Beach, who was formerly connected with the sales department of the Oliver Motor Car Company.

Members of the National Association of Automobile Manufacturers Enjoying the Banquet During the Progress of the Recent Convention in Detroit.

It is the intention of the Oliver Motor Truck Company to continue the manufacture of the Oliver 1500-pound light delivery wagon and the 3000-pound Oliver truck, with a few changes in the nature of improvements. The company will be located at 460 Lawton avenue, Detroit. It is said that the first cars will be ready for shipment in about 30 days. Mr. Beach recently returned

Digitized by Google

from a trip through Missouri and Nebraska and reports a large demand for light delivery cars and trucks in that section.

FACTORY BUILDING NEARLY READY.

Randall-Faichney Company Prepares for Increasing Business in Jericho Horns.

The Randall-Faichney Company, Boston, has occupied its new four-story fireproof structure at Jamaica Plain, Mass., and will greatly extend its business. The company has hitherto employed about 200 workmen, but as manufacturer of Jericho and Jubilee automobile horns and other goods 500 employees will be kept at work. The company will occupy the third and fourth floors, while the other floors have been leased to other concerns.

The area of the plant approximates two acres. The building is constructed of reinforced concrete and has a frontage on the railroad tracks of 70 feet and 250 feet on Atherton street. The Randall-Faichney Company has a large clientele in its horn field and an increased business is expected for 1913.

NEAL RETIRES FROM PRESIDENCY.

Becomes Chairman of Directorate While Nash Heads General Motors Company.

After a two years' term as president of the General Motors Company, Detroit, during which time a successful reorganization has been accomplished and the big company has been re-established on a profitable and stable basis, Thomas Neal is relinquishing that office to become chairman of the board of directors. He will be succeeded by C. W. Nash, for some time past manager of the big plant of the Buick Motor Company, Flint, Mich., one of the constituents of the parent organization.

The move is strictly in keeping with the understanding between Mr. Neal and the company when he took office. In the fall of 1910, when the big concern was refinanced and the executive offices were moved from New York to Detroit, the financial interests supporting the company realized the necessity of securing as president a man of very broad business experience. Mr. Neal was approached and urged to take the office, but he accepted with some hesitancy, because of the personal sacrifice involved, and only on condition that he might be permitted to retire at such time as the business was re-established on a satisfactory basis. When it is known that the General Motors Company was able to show a net earning of over 17 per cent. on the common stock during the past year, there can be little doubt that the task has been accomplished.

Under Mr. Neal's administration the company has concentrated its manufacturing operation at plants where large volume of production is possible. The result of this policy has been to make every plant an earner. The Cadillac, Buick, Oakland, Oldsmobile and Cartercar plants are all working to their fullest capacity to supply the trade which these well known cars have built up. All of the factories manufacturing accessories are enjoying similar prosperity.

To his many friends, Mr. Neal is best known as a man of domestic tastes, who derives his greatest pleasure from his home life, for the enjoyment of which the past two years have given him but little time. It will be a source of much gratification in the industry to learn that he is to retain his connection with the company and will serve in a definite and official capacity as chairman of the board of directors.

Thomas Neal, Retiring President, General Motors Company.

TO PRODUCE KNIGHT MOTORS.

Stearns Company Has Acquired Rights to Manufacture These for the Trade.

Frank B. Stearns, president of the F. B. Stearns Company, Cleveland, O., which concern has been producing a Knight engined car for the past year or more, announces that the company is prepared to manufacture Knight engines for the trade. Under its agreement with Knight & Kilbourne, this right is understood to have been con-

Digitized by Google

ferred upon the Stearns Company, and plans for putting it into force are said to have been under way for the past six months.

Recent factory additions have enabled the concern to make the present announcement, and it is stated that a number of car manufacturers have made arrangements for the Stearns company to supply them with motors.

BECOMES EASTERN SALES MANAGER.

E. A. Welch Takes Charge of the Distribution of Michigan Cars in This District.

Continuing its policy of surrounding itself with some of the best men in the industry, the Michigan Motor Car Company, Kalamazoo, Mich., has added to its sales department, E. A. Welch, one of the best known and most successful salesmen of the middle west. He becomes sales manager for the middle and eastern states, his territory including all the district east of a line extending from Chicago to New Orleans. He will reside in Kalamazoo and travel throughout the entire district, calling on distributors and dealers and establishing and supervising agencies.

E. A. Welch, Eastern Sales Manager, Michigan Motor Car Company.

Mr. Welch was for many years a successful merchant in Kalamazoo. Later he was in the tea and coffee business, with Dwinnell-Wright, from which firm he went to the Clark, Coggin & Johnson Company, and severed his connection with that concern to join the Michigan. His administrative ability commanded wide respect, and at one time he was offered the wardenship of the Michigan state prison at Jackson. He has a wide circle of friends, both in and out of the industry, and is particularly well known among the Elks, where he is much sought after as a toastmaster at social functions.

AMES LINE FROM KENTUCKY.

Well Known Carriage Maker Enters Automobile Industry with Two Models on One Chassis.

The Ames Motor Car Company, Owensboro, Ky., with paid in capital of $100,000, an offshoot of the F. A. Ames Company, which has manufactured fine carriages for 30 years, has placed upon the market a new line of automobiles in which there are two models, a touring car and a roadster. George W. Yeoman, formerly general sales manager of the Continental Motor Manufacturing Company, has complete charge of the building of the Ames cars, and Charles T. Smith is general superintendent.

F. A. Ames, head of the concern and principal owner, has utilized the knowledge, skill and experience that 30 years of first class carriage making have taught him, in building up an organization that is expected to secure results in the motor car industry. The two bodies of the Ames cars are built on the same chassis. The specifications call for an 118-inch wheelbase, 36 by four-inch wheel equipment, Continental 40 horsepower motor, left hand drive and centre control, full floating rear axle, ventilating windshield, electric lighting and starting equipment.

WILL MARKET NEW CAR.

King Company to Be Reorganized and Produce Model Designed by Bayerline.

Artemus Ward, the New York capitalist and member of the advertising firm of Ward & Gow, who recently purchased the plant of the King Motor Car Company, Detroit, will reorganize the concern on a more extensive scale. His son, Artemus Ward, Jr., will be connected with the new company. The reorganization will embrace some innovations and the concern will be a close corporation, limited to those now employed in the works.

The work of finishing all the stock of the King company will be carried out and a new car designed by J. G. Bayerline, who is general manager, will be placed on the market. Other officers of the proposed concern will be: President, J. G. Bayerline; superintendent, T. A. Bollinger; purchasing agent, J. B. Siegfried; factory foreman, J. Mohrhardt; sales manager, W. L. Daly; chief engineer, E. S. Chase. F. A. Vollbrecht will have charge of the accounting and George Gurney the service department.

ADDS MORE FACTORY ROOM.

Goodyear Tire & Rubber Company Acquires Another Plant to Prepare for Growth.

The Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, has acquired the entire property of the Akron branch of the Great Western Cereal Company, which is near the present Goodyear plant, and three new buildings are in course of construction. They will be used for storage until such time as it is necessary to utilize the space for manufacturing. When the additions are entirely completed, about March 1, 1913, the Goodyear company will have a capacity of 8000 tires a day, which will be just double that of the plant a year ago.

"The three latest additions will aggregate 335,300 square feet of floor space," says C. W. Sieberling, vice president of the Goodyear company. "This brings the total up to 1,935,300 square feet. To realize what this means, imagine a factory 50 feet wide and one story high. If the Goodyear factory were built in that way it would be over six miles long. Our sales for the fiscal year ending Nov. 1, approximated $25,000,000. At least one-third of the total cars produced during the 1912 season were equipped with Goodyear tires and it is safe to say that Goodyear tires will go on half the cars built next year. Contracts indicate that we shall supply to car makers 200,000 sets of tires."

R-C-H STRENGTHENS POSITION.

Two New Men for Vice President and Treasurer and Additional Directors Named.

The R-C-H Corporation, Detroit, maker of R-C-H cars, has secured additional financial support and will be enabled to take care of its business, which has grown too rapidly for the amount of capital invested. The creditors and stockholders were recently called into consultation and the company's financial condition was frankly stated in a report compiled by McPherson, Weiss & Co., expert auditor and accountant. This report showed an excess of assets over liabilities of $576,000.

As a result of this conference a plan was evolved which will permit the business to be extended. The board of directors was increased from three to nine, and the following were selected: J. W. Hartz, John Kelsey, R. C. Hupp, F. M. Randall, J. H. Clarke and C. P. Sieder of Detroit; G. W. Rogers and J. G. Robertson of Akron, O., and C. G. McCutchin of Jackson, Mich. At a meeting of the directors later, the following officers were elected: President, R. C. Hupp; vice president, C. P. Sieder; treasurer and general manager, J. F. Hartz; secretary, L. G. Hupp; assistant general manager, F. R. Bump. The active management of the concern rests with an executive committee of five composed of Messrs. Hartz, Kelsey, Randall, McCutchin and R. C. Hupp.

The new vice president is president of the Sieder Manufacturing Company, and one of Detroit's most successful business men. The new treasurer is president of the J. F. Hartz Company and a director in a number of other Detroit concerns. He became actively associated with the automobile industry four years ago when he organized the C. M. Hall Lamp Company. Mr. Bump was formerly sales manager, and as such built up a strong sales organization which sold 7000 cars during the first year of business and has contracted for the sale of 16,500 machines during 1913. Before his connection with the R-C-H Corporation he was sales manager for the H. H. Franklin Manufacturing Company, Syracuse, N. Y.

FLANDERS ACCEPTS PRESIDENCY?

Expected to Head Reorganized United States Motor Company After Sale in January.

According to the Wall Street Journal, Walter E. Flanders, at present president of the Flanders Motor Company, Detroit, has signed his acceptance of the presidency of the reorganized United States Motor Company. Publicity issued by E. Le Roy Pelletier of the Flanders company would seem to bear out this statement. It is understood, however, that the move is contingent upon the successful issue of present plans.

At the adjourned hearing before Judge Hough in the United States District Court in New York City, Nov. 18, the demurrer filed by certain minority stockholders was overruled. A tentative decree of sale was ordered to be amended in certain minor details. Bids may be filed with the receivers, 61st street and Broadway, New York City, until 10 in the morning of Jan. 8, and will be opened by Judge Hough at 11.

The tentative decree provides that the property of the present company shall be offered for sale in six parcels, that of the several companies involved being separated as follows: United States Motor Company, Alden Sampson Manu-

Digitized by Google

facturing Company, Brush Runabout Company, Columbia Motor Car Company, Dayton Motor Car Company and Maxwell-Briscoe Motor Company.

HEADS NATIONAL SALES FORCE.

J. M. Clarke Has Had Abundant Experience to Qualify Him for Position He Holds.

Few men connected with the auomobile industry are called upon to play a more important part in the success of the company with which they are connected than the sales manager of a large factory. Of course it is essential that he should be backed by a good car, but the disposition of the product is strictly in his charge. J. M.

J. M. Clarke, Sales Manager, National Motor Vehicle Company.

Clarke is sales manager for the National Motor Vehicle Company, Indianapolis, Ind., maker of National cars.

Mr. Clarke is eminently well qualified for his position, particularly as he has been connected with the industry since 1899, when he was associated with the Electric Vehicle Company, Hartford, Conn. He left that company in 1900 to spend the better part of two years with various factories in Europe. From 1902 to 1905 he was with the Pope Manufacturing Company, Hartford, Conn., and from 1906 to 1908 was connected with the retail sales business. He joined the National sales force in 1909.

It will be seen that he has had a systematic training in all branches of the sales field, and his success in his present position undoubtedly is due in no small measure to this fact. Not only is he able to view the proposition from the side of the manufacturer, but his experience as a retail salesman places him in very close touch with the National sales organization.

TO PRODUCE NEW TRUCK.

Leo Gillig of San Francisco Enters This Field on the Pacific Coast.

Leo Gillig, who has been connected with the motor car trade at San Francisco, Cal., for a number of years, has entered the manufacturing field and has turned out the first Gillig truck from his plant at San Francisco. The vehicle has 1500 pounds capacity and shows some new and decidedly interesting features. Mr. Gillig has contracted to place 50 of his trucks on the market for the 1913 season.

The new light delivery wagon has chain drive with patented differential of the most simple design. Either solid or pneumatic tires can be used and the bodies are built to suit the convenience of the purchaser. The truck has left hand drive and is durable in construction. It will be marketed at a popular price, and is expected to meet a long felt want in its particular field.

ADDING ANOTHER BUILDING.

Electric Auto Lite Company of Toledo Finds Imperative Need for More Room.

With the approach of 1913, the first year in which general complete equipment is the rule with automobile manufacturers, producers of accessories find themselves in urgent need of more factory space. The Electric Auto Light Company, Toledo, O., has found it necessary to erect an addition to its plant at 133-135 Michigan street, which will provide 40,000 square feet of floor space. The work already is under way and the concern expects to be installed in the new structure before the first of the year.

The Electric Auto Lite Company manufactures a new combined electric lighting and starting system for motor cars. The device, which will be included in the standard equipment of many machines for 1913 and 1914, is operated by a foot button in the floor of the car. The officers of the company are: President, Artemus W. Fisher; secretary and treasurer, Clement O. Miniger; manager, Sherman L. Kelly.

JOINS PHILADELPHIA CONCERN.

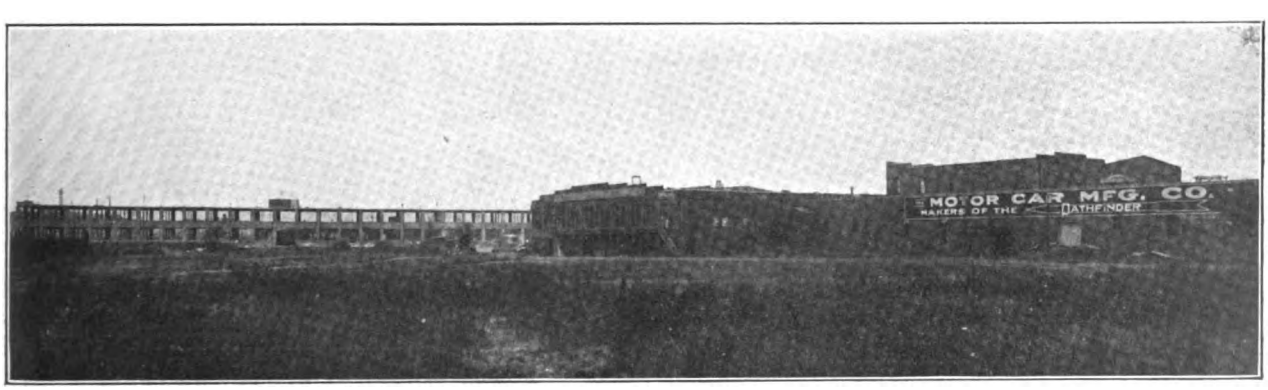
J. W. Drown Becomes Sales Manager of the Pressed Steel Manufacturing Company.

The many friends of John Wilson Drown will be glad to learn of his appointmnet as sales manager of the Pressed Steel Manufacturing Company, Philadelphia, maker of ball bearings. The field is not new to Mr. Drown, since he has been representing ball and roller bearings to the trade for some little time past.

Mr. Drown will be remembered as a former advertising manager of the Corbin Motor Vehicle Corporation, New Britain, Conn., with which concern he was connected for a number of years. Later he accepted the same position with the Standard Roller Bearing Company, Philadelphia. His wide acquaintance in the industry and his thorough knowledge, both of the manufacture of cars and of ball bearings, should make him particularly well fitted for his new position.

NEW PATHFINDER FACTORY.

Motor Car Manufacturing Company Finds It Necessary to Secure Additional Space.

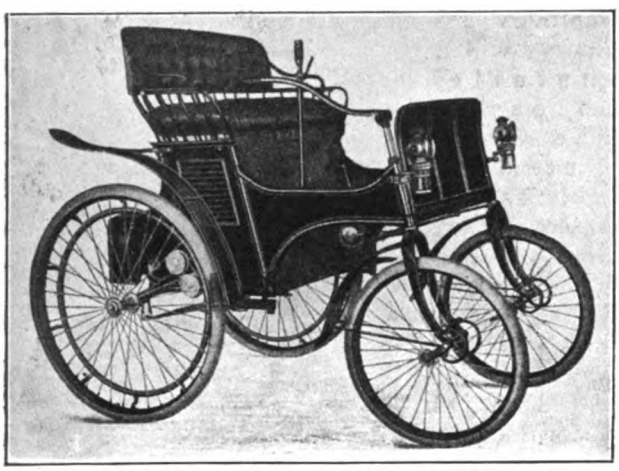


The increased demand for Pathfinder cars has impelled the maker, the Motor Car Manufacturing Company, Indianapolis, Ind., to acquire additional facilities for handling its 1913 production. The decision made it necessary that workmen should be employed night and day in completing the new plant, adjoining the present factory on Division street, West Indianapolis, and but a short distance from that of the Nordyke & Marmon Company. An accompanying photograph shows the building in course of erection, and it is anticipated they will be ready for occupancy before the advent of the new year.

The new structures are two stories in height, with an office building facing Division street. They are constructed of brick, glass and steel, and the working floor space is paved with cement. Communication will be had with the present building, and new improved machinery will be installed throughout. The bilateral system of lighting will be employed, and elevators will connect all the floors. The office building will be furnished with modern equipment and one of the features of the plant will be a factory showroom, in which all the Pathfinder models will be placed on display.

G. O. Simons, Factory Manager Motor Car Manufacturing Company.

Another illustration presents G. O. Simons, factory manager of the company, who is well known throughout the industry. That he is held in high esteem by his associates is borne out by his recent election to the directorate of the Indiana Automobile Manufacturers' Association. He is a firm believer in pathfinding tours, in which the Pathfinder cars have taken a prominent part, and will assist Carl G. Fisher in the proposition to establish a national highway to the Pacific Coast. He also favors the pathfinding trip over this route in the near future.



General View of the New Addition to the Factory of the Motor Car Manufacturing Company, Indianapolis, Ind.

PIONEER AMERICAN GASOLINE AUTOMOBILES.

Continuing Early History of the Industry---First Motor Starter, Four-Cylinder Car and Commercial Vehicles---Progress Revealed by Knox Company.

IT WAS pointed out in the previous installment that the identity of the real pioneer designer of American gasoline automobiles is

Max Hertel's Self-Starting Car of 1895, First Machine in America to Win Prize for Starting from the Seat.

shrouded in mystery. Contemporaneous with Charles E. and J. Frank Duryea and Elwood Haynes were a number of other men, now prominent figures in the industry. R. E. Olds was experimenting as early as 1886, although machines bearing his name were not offered to the public until some years later. A. J. Pierce already has been mentioned as having produced a car in 1893, or thereabouts, and Henry Ford's name must be listed during that year as well. In addition, there were many inventors whose product never became known beyond the section in which they resided. At that time little effort was made by the general public to encourage those who thought they foresaw a great future for the gasoline propelled vehicle.

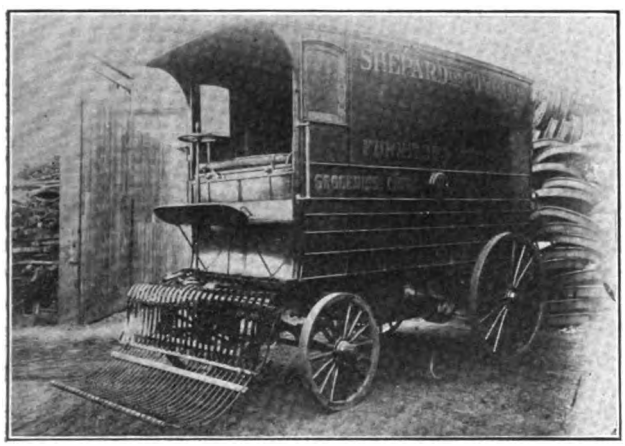
It was during the Three Counties fair on the old Guttenburg race track in New Jersey, in the fall of 1893, that the press of the country first took any real interest in the horseless carriage, as it was termed then. Some of the machines, it does not appear whether they were driven by steam, electricity or gasoline, went around the track in better than 50 miles an hour, so it is reported. It was as a result of this exhibition in a measure that the Chicago Times-Herald arranged its memorable race of Thanksgiving Day, 1895. As stated in the last issue, this event was won by J. Frank Duryea in a Duryea motor wagon.

Since his was the only machine of this make entered, it follows that other constructors must have been represented. Among these was Max Hertel, whose machines later were constructed by the Oakman Motor Vehicle Company, Greenfield, Mass. Duryea appears to have taken the only prize in the race, but Hertel was awarded $100 for "an arrangement for starting the motor from the seat." Evidently there was interest in the motor starter thus early in the history of the industry.

Max Hertel's Motor Starter.

Hertel's machine was fitted with a two-cylinder motor, of 3.625-inch bore and 4.75-inch stroke, rated at 2.5 horsepower. Each cylinder was equipped with a separate muffler, and one of these was utilized for the purpose of heating the air for vaporizing the gasoline. A small generator, running by belt from the high speed shaft, furnished the current for ignition.

Two bicycle wheels were used in front, each being mounted in a separate bicycle fork. The



First Four-Cylinder Car Made in America, Designed by Edward F. Scholze and Driven by James E. Blake.

one on the right was extended upward to form a post for the steering tiller. An arm projected to the rear from the junction of the fork and

Digitized by Google

socket and these arms were joined by a link rod underneath the front of the body.

The starting mechanism consisted of an

First Commercial Vehicle Built in America, Designed by L. F. N. Baldwin and Operated in Providence, R. I.

operating lever having a vertical motion controlled by a pin on the vertical rod traversed by a helical slot in the handle. A small hand clip, when closed against the lever, lifted the rod linked to it and the stop on a starting pawl dropped into the teeth of a geared crank wheel. A fore and aft movement of the lever turned the motor over. At the same time a twist of the handle opened the gasoline regulating valve. When the clip was released the pawl was thrown out of engagement and locked in its normal position.

Winton Makes Long Tour.

In 1896 Alexander Winton produced a car which was placed in the market the following year. He appears to have been convinced at first that long distance touring was the best means of calling the attention of the public to the practicability of the new type of vehicle. July 28, 1897, Winton left his home in Cleveland, O., for New York City, and reached his destination Aug. 7. He first used a stationary motor and all of his earlier vehicles were extremely heavy. In May, 1899, Winton duplicated this trip, driving a Winton phaeton, and the Winton surrey, claimed to be the first four-passenger gasoline car, approaching the tonneau design, was built about the same time.

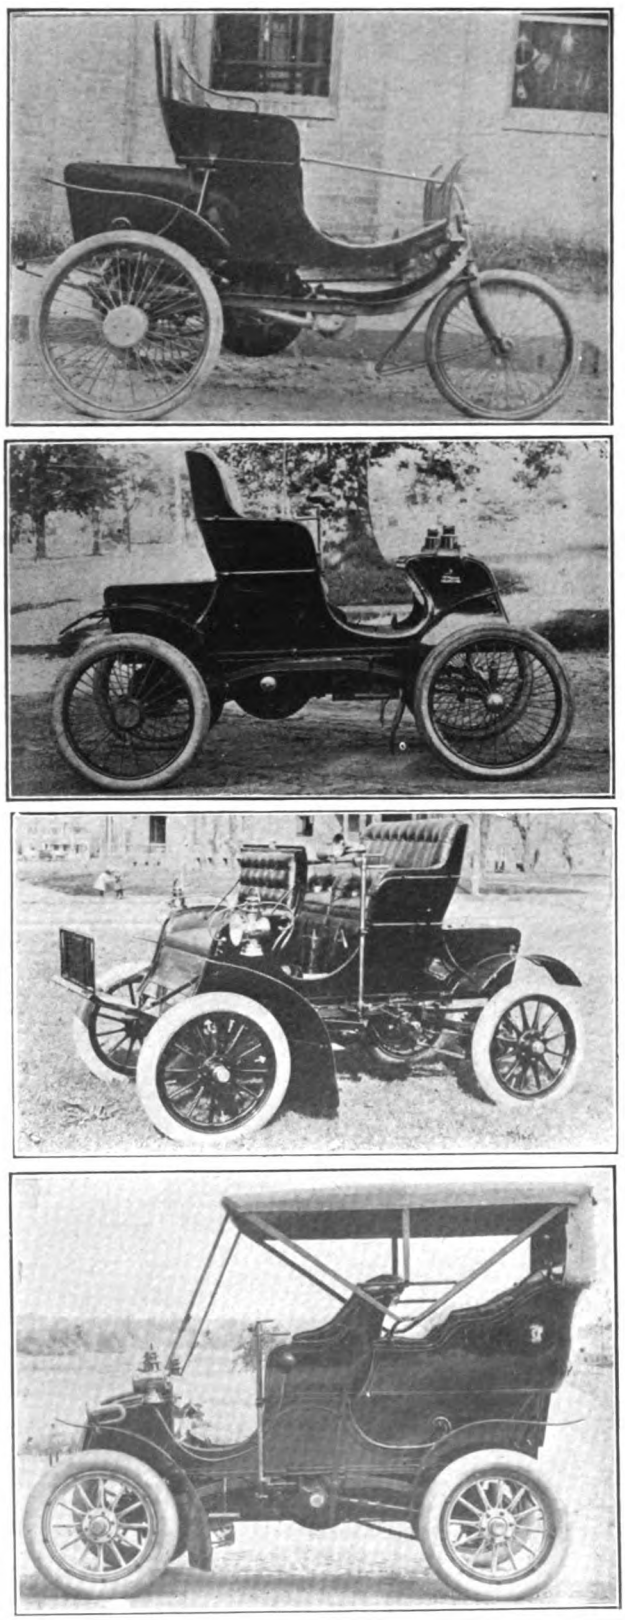
Baldwin Designs Delivery Wagon.

The first gasoline commercial vehicle built in America was designed by L. F. N. Baldwin of Providence, R. I., who undertook the task upon the order of John Shepard, Jr., as a delivery wagon for the Shepard Company. The actual work of carrying out the plans was by the Cruickshank Engine Company of that city.

Because of inefficient carburetion this vehicle was not considered an absolute success, despite the fact that it was used in the service for which it was intended for a time. The motor was a two-cylinder, four-cycle, double-impulse unit, said to develop about 25 horsepower. There were two admission and two exhaust valves for each cylinder, the former being so located that they were between the cylinders when the engine was set up and the exhaust members were on the outside. The latter were mechanically operated by a camshaft driven by the crankshaft with conventional half-time gears, but the admission valves were unique in that each contained a carbureting device. Ignition was by hot tube.

The body construction is evident from an inspection of the accompaning illustration. The wheels were fitted with steel tires, and this was found to be another disadvantage, in that it became difficult to secure traction at times. The addition of a fender was another decided innovation. The body work was done by a western body builder, while the running gear was made nearer home.

Autocar's Early Business Vehicles.



About the same time the Auto Car Company of Swissville, Penn., was experimenting along the same line, and in 1897, the vehicle shown herewith was produced. This is believed to be the first commercial vehicle offered for gen-

Autocar of 1897, First Gasoline Business Wagon Built on a Commercial Basis.

eral sale. It was fitted with two single-cylinder motors, placed end to end, with cranks 180 degrees apart. These cars were manufactured in

Digitized by Google

Early Knox Models: Reading Down—A, 1899 and 1900; B, 1901; C, 1902; D, 1903.

connection with the pleasure machines made by the Pittsburg Motor Vehicle Company, and the two concerns were merged into the Autocar Company a little later.

In the meantime, Kenneth A. Skinner of Boston had imported his De Dion tricycle in 1895, and there is little doubt that his efforts had a decided influence upon the American industry. Skinner opened salesrooms at 122 Massachusetts avenue in Boston and the first machine was sold to Harold Brown of that city. He later purchased a quadricycle attachment, thus giving him a passenger machine. In 1897 Skinner succeeded in interesting the Waltham Manufacturing Company of Waltham, maker of Orient bicycles, in the production of motor pacing machines, and in the following year the first Orient victoriette made its appearance. This was fitted with a five horsepower De Dion motor and had seating capacity for four persons, two being located in front on a folding seat arrangement.

Orient and Other Pioneers.

Later Henri Fournier of France arrived in America, unable to speak a word of English, but possessed of an Aster motor packed in his trunk. Albert Champion, now a spark plug manufacturer in Flint, Mich., is said to have become interested in Fournier and to have been instrumental in getting the Orient people to investigate the merits of the Aster motor. Fournier is conceded to have been the most expert operator of a motor tricycle that the world ever knew. When automobile racing became an established feature he was quite as successful in that field.

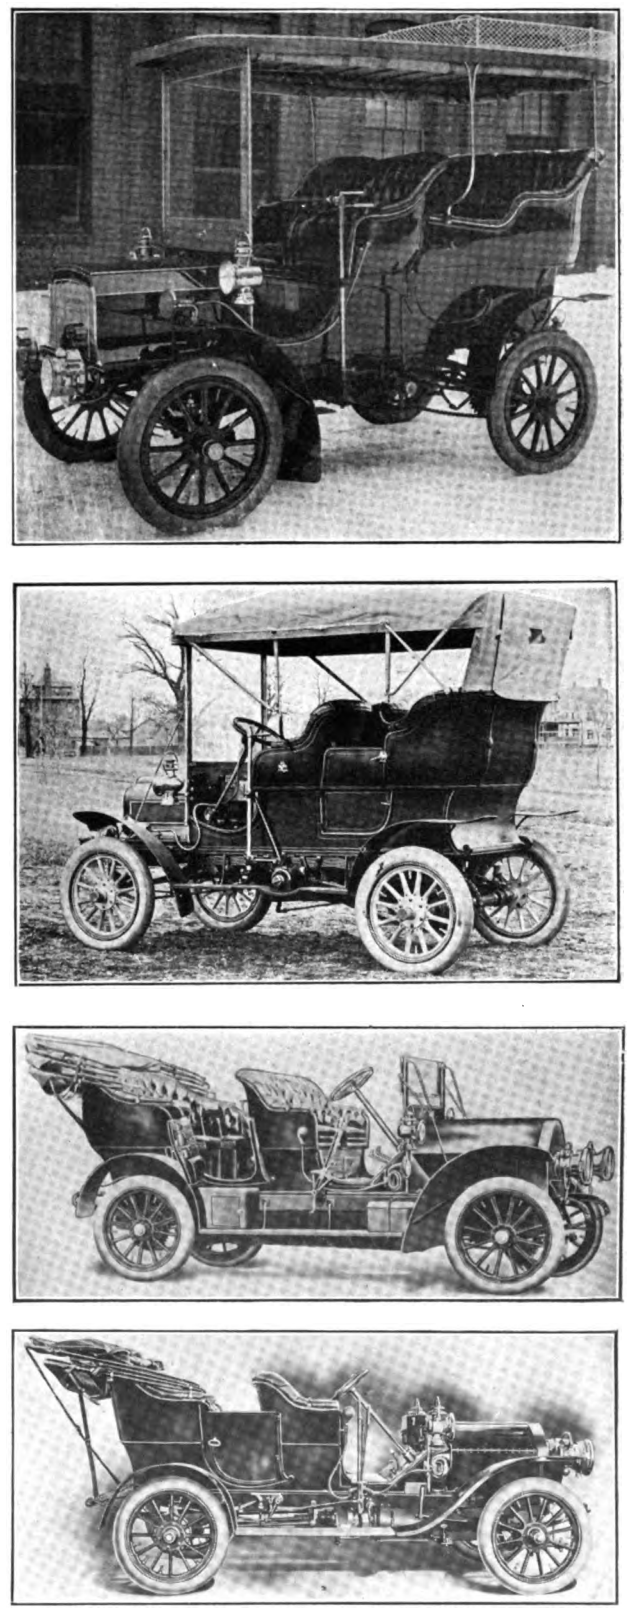
Several other cars were introduced to the public during this period, among them being the St. Louis, the Booth-Couch, the Loomis, and undoubtedly a large number of others which have long since been forgotten. Some men in the industry remember the Altham, which was originally produced in Pawtucket, R. I., and was later known as the Country Club. The designer of the first machine later removed to Chicago, according to the best information available, and seems to have been lost to view.

First Four-Cylinder Car.

What is regarded as the first four-cylinder car to be produced in America was designed by Edward F. Scholze in Pawtucket. He was much interested in motor boating, but after seeing one of the De Dion motors in an automobile he decided to experiment along these lines. His first engine was a two-cylinder unit and was more or less a copy of the De Dion, with the exception that the cylinders were horizontal instead of vertical. Later he drew the plans for the car men-

Digitized by Google

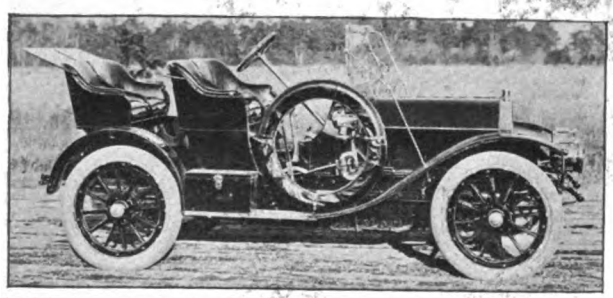
tioned, and when he became discouraged, the drawings and the material were purchased by James E. Blake of Attleboro, Mass., who was at that time interested with Frank Mossberg and some others in the United States Automobile Company in the manufacture of electric vehicles. The car was completed in 1898, and a photograph taken in August of that year is reproduced herewith.



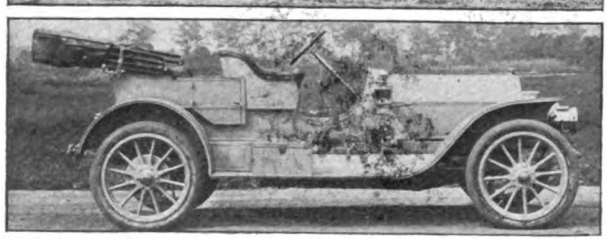
The motor was virtually two two-cylinder, double-opposed motors placed side by side with a common crankshaft. It was of the air-cooled type and operated on the four-cycle principle. Provision was made for advancing the spark, a feature which is regarded as having been a distinct innovation at that time. The electrical ignition, supplied by a battery, was controlled by an ordinary electric light button located on the dash. On each of the four cylinders was a cam device which caused contact to be made at the proper instant, thereby forcing the current to jump the gaps at the spark plug. A lever on the side of each cylinder head was connected by suitable wires to a master lever at the right of the driver's seat, and when it was desired to advance the spark, this master lever was pulled, turning each of the cylinders the same amount.

The machine was driven from Attleboro to Newport, R. I., and elsewhere about that section, but was not regarded so successful as the electrics upon which the company was then engaged. It was finally traded to a New York jewelry buyer for 30 pieces of cut glass. He in turn traded it for collar buttons. The last heard of it in Attleboro, the steamship company had attached it on account of the owner's failure to pay the freight from Providence to New York City.

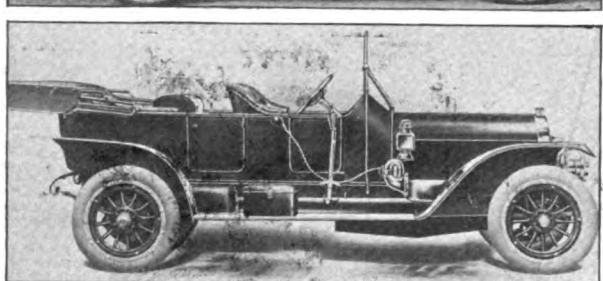
Knox Three-Wheeled Machine.

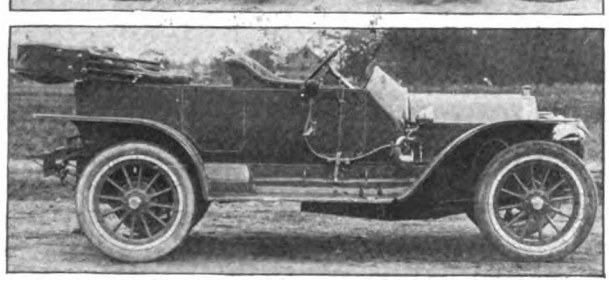


This brings the industry to that period where it may be regarded as having been permanently established. The product of the Knox Automobile Company, Springfield, Mass., may be selected as presenting the progress that has been made since 1899. These cars have been produced under the same name from the beginning, and the changes indicate in a large measure the various steps which have been taken in the development of the modern gasoline automobile.

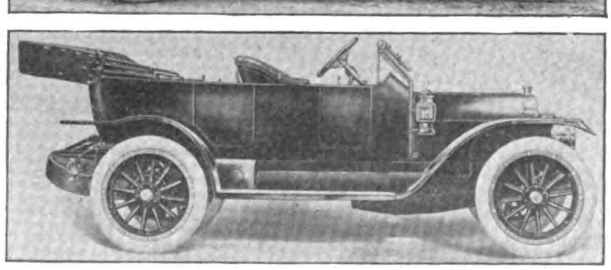


The first Knox car was a three-wheeled machine, equipped with single-cylinder, air-cooled motor, of 4.5-inch bore and six-inch stroke, rated at eight horsepower. It differed from some other productions of its day, in that it had what might be regarded as a separate chassis construction. This was placed in the market in 1899 and con-

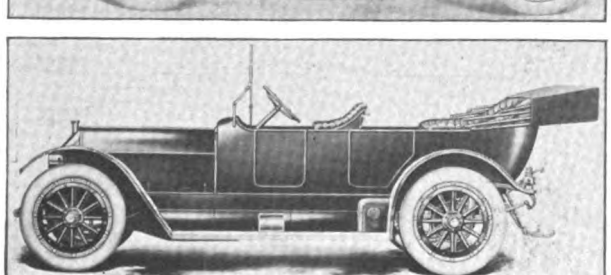




Later Knox Models: Top to Bottom—E, 1904; F, 1905; G, 1906; H, 1907.



Digitized by Google



Modern Knox Models: Reading Down—L, 1908; O, 1909; S, 1910; 1911; 1912; 66, 1913.

tinued without change in 1900 as model A.

The tiller steering was continued in the model B of 1901, but the tiller post came up through the floor in front of the driver's seat instead of over the dash. Four wire wheels were fitted to this machine, and the motor still remained a single-cylinder, air-cooled unit.

The Knox company appears to have adopted the left hand drive in its early cars, in common with the practise followed by other American constructors. Model C of 1902 accommodated four people, the front being arranged so as to provide a backrest for two extra passengers, and a footboard also let down. Wood wheels replaced the wire members of previous years.

In model D, produced in 1903, the single-cylinder motor gave way to the two-cylinder unit. This was a regulation four-passenger vehicle equipped with a top and other more modern fittings. Model E, 1904, provided for five passengers, the tonneau being entered from the rear. The top was decidedly more pretentious, and a space was provided for spare tires overhead. This also marks the introduction of the windshield.

More Modern Knox Models.

Model F, 1905, continued the left hand drive, but steering was by wheel. The entrance to the rear compartment was by the side instead of the rear. Model G, 1906, saw the first application of the four-cylinder, air-cooled motor in Knox cars, with the motor in front under the hood, according to present day practise. The driver was changed from the left to the right hand position as well.

The other machines are of such recent date that little comment seems necessary. Model L, 1908, had the first four-cylinder, water-cooled Knox motor, and model S, which appeared in 1910, was the first six-cylinder car of this make. Particular reference should be made to the method provided for carrying spare tires on the 1912 model. Model 66 is the latest development for the 1913 season.

Alpha and Omega in Packards.

Another indication of the changes in design and construction which have been made during the same period is presented in the illustration of the two Packard cars on the opposite page. That on the left was completed by J. W. Packard at Warren, O., in 1899, while the six-cylinder machine on the right is the new model 48 produced by the Packard Motor Car Company, Detroit. The contrast is sufficiently marked to make comment unnecessary.

(To Be Continued.)

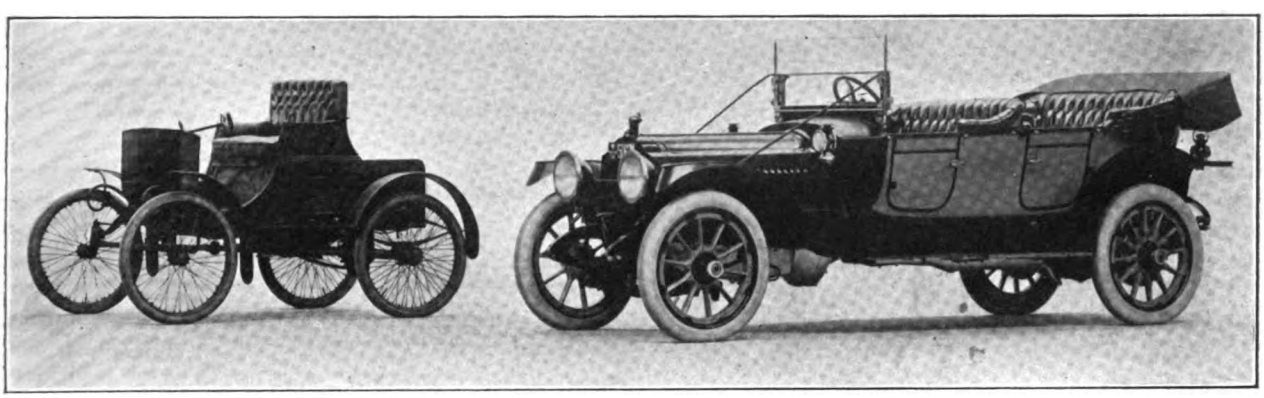
SELECTS FIRESTONE-COLUMBUS.

Harry L. Wisebaum, who has been engaged in the automobile touring business in southern California for the past two years, recently purchased five Firestone-Columbus touring cars, made by the Columbus Buggy Company, Columbus, O., of Volney S. Beardsley of San Francisco, factory representative of the company. Previous to the purchase Mr. Wisebaum tried out six different makes of machines, but in the last analysis discarded them all with the exception of the Firestone-Columbus, which he considers embodies the cardinal virtues for touring—economy, comfort and speed.

INTENSIVE SALES CONTEST.

The Thomas B. Jeffery Company, Kenosha, Wis., maker of the Rambler cars, has just made the awards in a contest in which 50 picked salesmen of the Jeffery organization participated and which gave a fine demonstration of the results of intensive sales methods. These salesmen united with 560 dealer representatives in a campaign beginning July 15 and ending Oct. 15. Ten prizes were awarded and the winners represent territories from the Atlantic to the Pacific.

The result of the number of orders is that the Jeffery company is more than 700 cars behind on immediate deliveries, while 40 per cent. more cars have already been contracted for than were manufactured last year. The present season has seven months to run, so the company expects to break all its previous records in the matter of output.



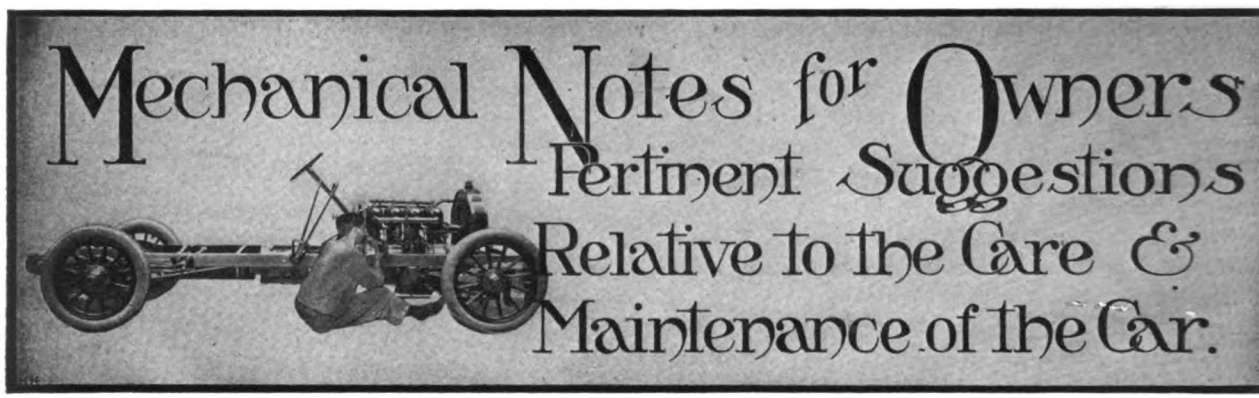
The winners in the contest are: First, E. E. Redhead, Philadelphia; second, G. E. Matteson, New York; third, I. R. Campbell, Illinois; fourth, C. O. Hart, Iowa; fifth, S. S. Jenkins, Ohio; sixth, A. J. Kleimeyer, California; seventh, J. S. Hurley, Delaware; eighth, R. L. Butler, Philadelphia; ninth, M. W. Higgins, New York; tenth, G. B. Owens, Illinois.

SATISFIED WITH FISK TIRES.

John Shepard, Jr., president of the Shepard Company, Providence, R. I., is an appreciative user of Fisk heavy car type tires and has reported his success with them to the maker, the Fisk Rubber Company, Chicopee Falls, Mass. The following is an extract from a recent letter to that company:

"Now I have two more to report, which were put on my car before we went to California last fall. One of them was No. 10,156, which was put on Sept. 28, 1911, and ran 9969 miles. The other, No. 52,563, was put on Nov. 17, 1911, and ran 9390 miles."

These shoes were used on Mr. Shepard's Knox car, made by the Knox Automobile Company, Springfield, Mass., and the service which they have given him has been duplicated by many users of Fisk tires.



Comparing the First Packard, Made by J. W. Packard at Warren, O., in 1899, with the Latest Six-Cylinder Car Produced by Packard Motor Car Company, Detroit.

FIVE-YEAR OLD GARFORD IN SERVICE.

At the Garford plant at Elyria, O., where the Garford cars are made, is a five-year old machine of six cylinders, the first ever turned out at a factory, which is still doing active service in general work about the plant. After the machine was thoroughly tested and the soundness of its construction fully proven, it was used by A. L. Garford for a time as a private car. Since then it has been doing general work about the shops and today it has travelled between 85,000 and 90,000 miles. In that time the motor has been overhauled but once while the body and chassis have received only ordinary care.

TYPE B H 4 MEA MAGNETO.

The type B H 4 Mea magneto for which Marburg Bros., Inc., New York City, is importer and agent, differs materially from the true high-tension ignition instruments previously described, in that its construction permits of the simultaneous movement of the magnets and breaker, instead of the latter only. In conventional practise the low-tension or primary current ordinarily is short circuited by a breaker that opens at certain points each revolution, producing a high-tension current in the secondary winding at the

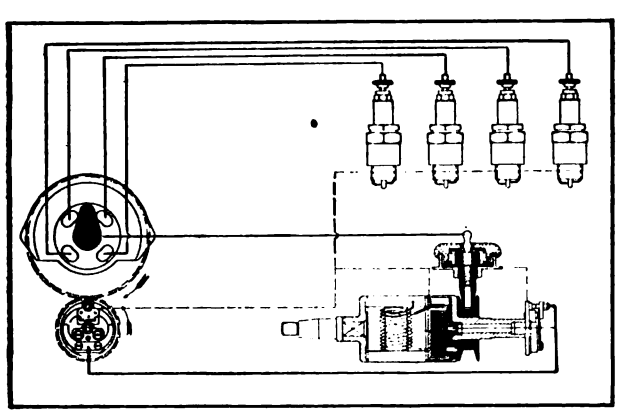

Fig. 1—Showing the Simplicity of the Wiring of the Mea True High-Tension Magneto.

instant of the break or separation of the contact points in the breaker mechanism.

The timing of the spark is accomplished by causing the break to occur early or late, and if the magnetic field (the magnets) cannot be moved the relation between the armature and the field must be changed when the spark is to be advanced or retarded. The intensity of the current generated depends upon the relative position of the armature to that of the magnetic field; that is, it is built up from zero to its maximum, then decreased to zero again, this occurring twice to each revolution of the armature. To obtain the maximum efficiency, or in other words, the hottest spark, the breaker box is moved into an early position to secure the proper break, according to the speed of the motor. This movement is ordinarily imparted by the spark lever on the steering wheel, although it should be borne in mind that there are types of magnetos where the spark is automatically advanced.

How Mea Principle Differs.

With the Mea instruments the magnet is bell shaped, instead of horseshoe, being placed horizontally and in the same axis with the armature. The breaker mechanism is secured to the magnet, and is advanced and retarded simultaneously with it, establishing retarded positions between the magnet and the armature field that cannot vary. This insures the same quality of spark at all times because the break occurs when the generation of current is at its maximum intensity, and this value is not changed by fully retarding or advancing the spark lever. It is held by the maker that the design provides for a greater latitude in timing and that the motor may be started by a quarter-turn, regardless of the position of the spark lever. It is also pointed out that the shape of the magnet makes for greater magnetic permanency.

Construction of Magneto.

At Fig. 2 are presented three views of the Mea, that at A illustrating the front or driven end, C the breaker box, and B a sectional drawing outlining clearly the components of the instrument. At A is shown the spark lever connection and the manner in which the magnet is oscillated upon the base, it being turned in a direction opposite to that of the armature rotation to advance, and in the same direction to retard the spark. A quality of the construction is that the magneto may be removed easily from its base by detaching two simple connections. Its replacement is equally easy as the indicator in the timing window denotes the proper setting and

Digitized by Google

makes it a simple matter to time the instrument.

The armature rotates in ball bearings and comprises mainly an I shaped iron core, mounted on a spindle and wound with primary and secondary windings as in conventional practise. It also carries a condenser, collector ring and low-tension breaker mechanism. The last named comprises a disc having a short platinum contact member, while a similar adjustable member is supported by a spring secured to an insulated plate mounted on the disc, as illustrated at C.

The breaker is actuated by a fibre roller, shown at B, in connection with a cam disc which is provided with two cams and located inside the breaker, being secured to the field structure. In revolving with the armature the roller presses with a removable cover which also supports the low-tension grounding brush utilized to prevent the ball bearings from being impregnated by electricity. The cover member carries the safety spark gap as well, this being employed to protect the armature against excessive voltages developed when the leads to the spark plugs are disconnected and the armature is rotating.

The distributor consists of a stationary part and a rotating member, the latter being actuated by the armature shaft through steel and bronze gears. The current is led to this member from the carbon collecting brush, through the bridge and carbon member to distributing brushes placed at right angles to each other and making contact alternately with contact plates imbedded in the stationary part. The plate members are

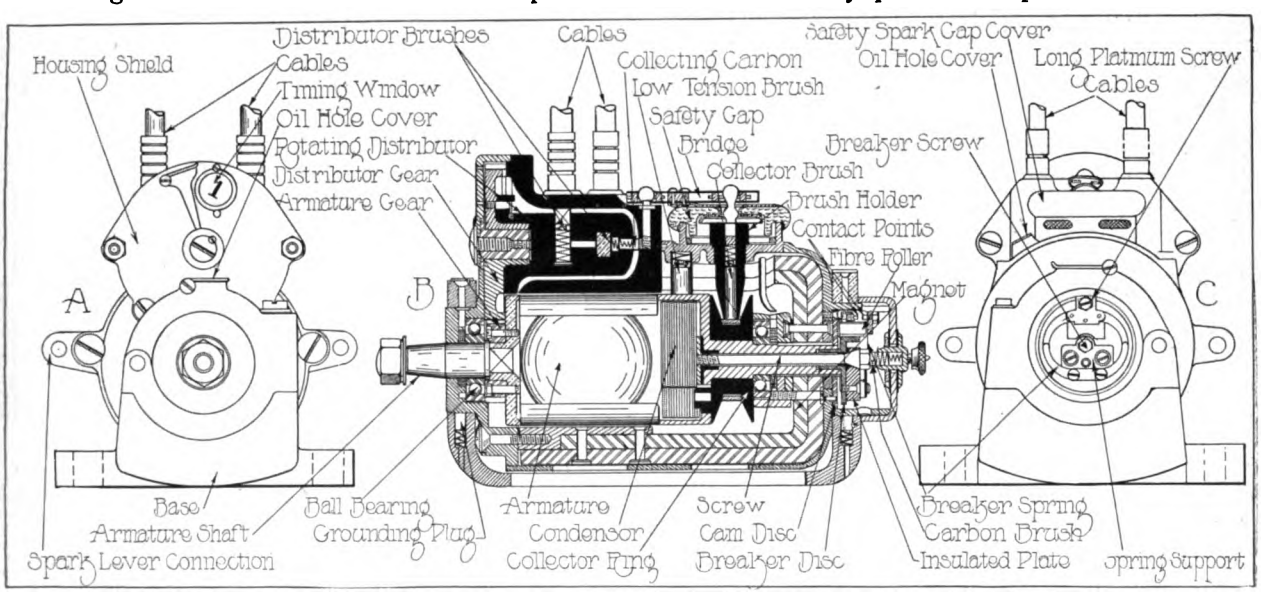

Fig. 2—The B H 4 Mea Magneto: A, the Driving End, Showing the Timing Window and Method of Oscillating Magnet; B, Sectional View; C, Breaker End.

against the spring supported portion of the breaker whenever it rolls over the two cams, separating the contact points twice each revolution.

The cover of the breaker box supports at its centre a holder carrying a carbon brush which is in contact with a screw. This screw connects with one end of the low-tension winding while the other end is connected to the core of the armature. Therefore the primary is short circuited when the contact points separate. When connection by wire between the terminal screw and the ground or metal of the chassis is made, the primary winding is permanently short circuited, preventing sparking at the plugs.

Operation of Secondary Circuit.

The high-tension current is collected from the ring member by a carbon brush having a holder connected to contact holes in the top of the distributor, into which the terminals of the cables leading to the plugs are inserted.

Timing the Magneto.

One of the qualities of the Mea is the provision made for timing after it has been removed from the motor for cleaning or inspection purposes. Before removing the instrument crank the motor or move the timing lever until one of the numbers appears in the timing window; then displace the magneto by opening up the base bearings, and leave the engine undisturbed while the magneto is out of its base. In replacing, all that is necessary is to observe that the same number is shown on the indicator. The cables are provided with rings, the number denoting the proper cylinder.

Digitized by Google

In installing a new instrument the varying characteristics of different motors will require consideration and the setting should not be made permanent as it may be necessary to slightly modify the timing. Place the magneto in the position of maximum advance by turning the housing or timing lever in the direction opposite to that of armature rotation. Remove cover from breaker box, turn armature shaft in direction of rotation until the figure one appears at the window and until the contact breaker begins to open. Crank the motor until the piston of the first cylinder is from .625 to .875 inch in advance of dead centre. The various leads are then connected, according to the wiring plan presented at Fig. 1, taking care to make the connections with reference to the firing order of the motor.

The driving connections are next secured and the motor started, testing its operation with the spark advanced and retarded. It is advisable to be careful in cranking the motor for the first time. In connecting the timing gear it should be borne in mind that the range of the Mea is greater than with ordinary types and that the gear should be modified slightly. This usually may be accomplished through lengthening or shortening one of the various levers of the timing gear.

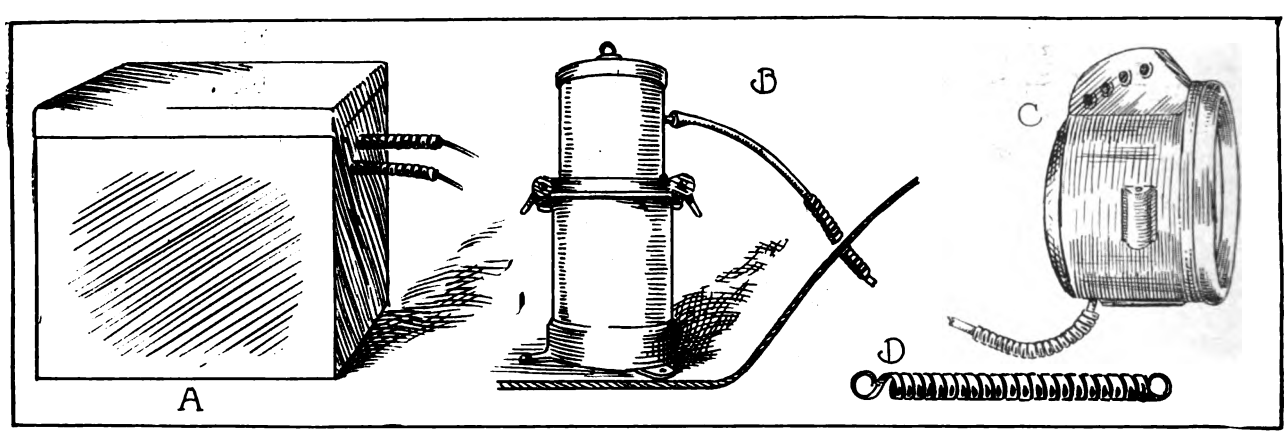

Fig. 3—Illustrating Some Uses of Flexible Metallic Tubing: A, Protecting Leads from Battery Box; B, Eliminating Chafing of Gas Tubing; C, Covering Tubing Connections of Gas Lamps; D, Suspending Leads Subject to Vibration.

Oiling and Maintenance.

The magneto requires but a few drops of oil in the proper holes every few weeks, depending upon the service. The breaker member must not be lubricated. The top cover supporting the high-tension carbon should not be removed when the motor is operating, as this component contains the safety spark gap.

The gaps of the spark plugs should be set about .015625 inch or as shown by the wrench accompanying the magneto, which is also employed for adjusting the low-tension breaker mechanism. The platinum contact points should be so set that the breaker begins to open when the figure in the timing window is exactly vertical, and the distance between the points should be .015625 inch, or slightly more. There is a gauge provided for this work.

Care should be taken to lock the adjusting nut. These adjustments will be required only when the platinum members have become pitted or burned, a condition usually caused by oil or dirt. They are cleaned easily by fine crocus paper or if necessary, with a jeweller's fine file. The contacts should always be true. Before attempting any adjustments make sure that the plugs or cables are not faulty, as these members are the most common sources of trouble. Keep the points clean and the gap about .015625 inch. Faulty cables are detected by noting the condition of the spark at either end and if the wiring is in good condition the plug should be examined. The burning of the points increases the gap, which should be held to size.

Irregular operation may be due to a defective or chafed ground wire—that leading from the screw terminal of the breaker box to the switch, thence to the ground. This may be tested by removing it from the magneto. The latter may be stopped by grounding; that is, by connecting the terminal with any metal part of the motor with a conductor of electricity, a screw driver for instance. If dirt or carbon accumulates on the inside of the distributor, the latter may be removed after loosening the two screws securing it to the housing. Aside from these minor adjustments the motorist should not attempt repairs, but in the event of serious trouble he should forward the magneto to the representative of the maker.

Digitized by Google

UTILIZING FLEXIBLE TUBING.

There are several accessories of the motor car which are subject to wear and deterioration, such as the wiring, gas tubing, etc. The life of these members could be considerably prolonged and the driver saved annoyance on the road, at a small expense and a little labor. There is marketed a flexible metallic tubing, the base of which is aluminum, resembling the covering of the speedometer cable. It is inexpensive and comes in different sizes having openings which will take various sized wires as well as gas tubing.

At Fig. 3 are presented several suggestions for the utilization of this tubing, that at A showing how the primary wires from the battery box could be covered to prevent chafing. The tubing is inserted snugly and a section allowed to project both in the interior and exterior of the battery box. The kink would be especially practical if the box were metal.

At B is a suggestion as to how it could be employed to protect the rubber tubing leading from the generator or tank, when it passes through the metal apron of the running board. A small piece will answer and it should be of sufficient outside diameter to fit snugly.

At C is depicted the method of utilizing the tubing for connecting the main lead from the tank to the headlight by inserting it in the metal pipe. This would keep the air from checking and spoiling the rubber, thereby increasing the life and service of the tubing.

On some machines the battery is placed under the tonneau and the wires are led along the sills of the body to the coil or switch. The usual method is to secure them with insulated staples, but if the work is not performed carefully the leads will vibrate and chafe, causing mysterious short circuits and poor operation of the motor, conditions usually blamed to the carburetor.

The metal tubing referred to is wound spirally and a portion of each end could be unwound and formed into eyes for attaching to the body. The wires are previously inserted and the clip secured to the wood. By utilizing a little friction tape at the ends of the clip the leads would be prevented from chafing in the event the wires did not quite fill the tubing.

SOLVING THE PARKING PROBLEM.

Birmingham, Ala., is now working out a problem that is of interest in every city in the country and the solution promises to be one that will recommend itself to all communities troubled with the parking of automobiles about public buildings and squares. L. A. Whitehead of the Highland Garage Company has announced that if the city desires a garage he will cause one to be erected within two blocks of the business centre.

The building, if erected, will be for storing automobiles during business hours. If the project can be arranged, Mr. Whitehead will have a checker at the municipal garage, also a call driver, who will call for and deliver automobiles down town to those who have no drivers, but who want their automobiles near their business offices. The city officials and Mr. Whitehead are working on the problem.

GRINNELLS FOR CZAR'S HOUSEHOLD.

Gustave Bansmyr, official envoy of the Czar to America, who recently visited Detroit for several weeks, has returned to Russia. Mr. Bansmyr came to this country in search of an exclusive Russian agency for an easy riding electric vehicle and incidentally, to select the model or type of car best suited to the needs and requirements of the members of the Czar's household.

After watching the work of various machines about the streets of Detroit and visiting the factory of the Grinnell Electric Car Company, he signed a contract for Grinnell cars. The first shipment of seven machines will leave Detroit before Dec. 1. Two of these will be furnished with gray interiors and consigned to the master of the household, the Imperial palace at St. Petersburg. Royal purple embroidered silk crests will be attached to the tufted satin ceilings when they reach their destination.

TOURING EUROPE IN PIERCE-ARROW.

Joseph F. Sartori, president of the Security Savings Bank of Los Angeles, Cal., and Mrs. Sartori, Joseph Sartori, Sr., Miss Julia Boileau and Miss Florence Silent, have returned to Los Angeles after a tour of 75 days through numerous European countries. During the time Mr. Sartori covered 5725 miles in his 48 horsepower Pierce-Arrow machine, which he had shipped direct from the factory of the Pierce-Arrow Motor Car Company in Buffalo, N. Y., to Paris. He sent his own chauffeur from Los Angeles to Paris and recommends every American who contemplates a tour of Europe to do the same. The journey led the party through France, Northern Italy, Switzerland, Austria, Germany and the Netherlands.

CORRESPONDENCE WITH THE READER

Magnetos and Dynamos.

(1453)—Will you kindly explain the difference in the operation and construction of a magneto and dynamo? What is meant by residual magnetism? Also how a permanent and electro-magnet differ? W. E. H.

Holyoke, Mass., Nov. 12.

A dynamo has an electro-magnet which is known as the field magnet to produce the magnetic field, whereas in a magneto this field is produced by means of permanent magnets. The latter are so termed because they are excited by a powerful current and retain their magnetism for a very long time, and to distinguish them from electro-magnets which are excited only so long as a current is passing through wiring coiled around them.

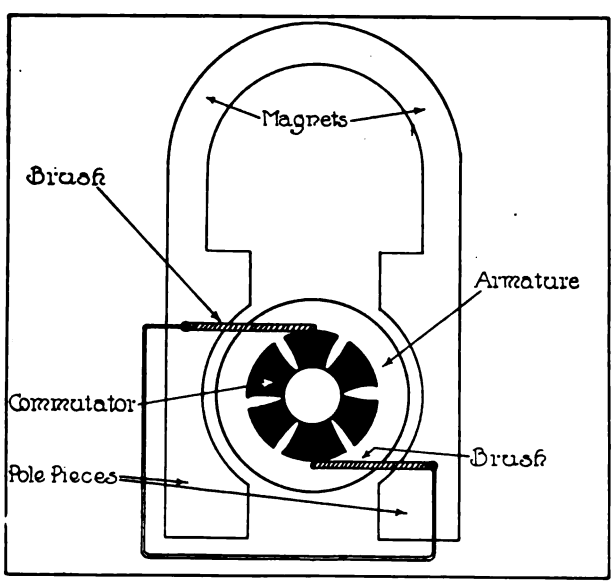

Fig. 1—Illustrating the Components of a Magneto.

The flat horseshoe magnets sold as toys are permanent magnets and lines of force pass from one end or pole, called the north or positive, to the other, known as the south or negative. If a small piece of iron or steel be brought close to the ends of the magnet or within the zone of magnetic influence, it will be attracted quickly. The magnet, however, will have no influence upon a piece of brass, copper, tin or zinc. This influence radiating from the poles of the magnet is termed the magnetic field.

If a length of insulated wire be wound into a coil and passed through this magnetic field, a current will be produced in the wire and the magnetic lines of force will be travelling in one general direction on the inside of the coil and in the opposite direction on the outside. In the magneto the coil of wire passes through the magnetic field by rotation, it being wound upon a cylinder or armature as shown at Fig. 1, which depicts a diagram of a magneto. Upon each revolution of the armature the wires become saturated with electricity. Attached to the lower ends of the magnets are the pole pieces and the armature revolves very closely to these members, which increases the magnetic field.

The armature is provided with two deep longitudinal grooves, one diametrically opposed to the other, so that the transverse section looks like a letter H. Insulated copper wire is wound onto the armature lengthwise, so as to lie in these grooves. The wire is short and thick, or long and thin, according to whether a low-tension or high-tension current is desired. As there are two pole pieces, each time the armature makes a revolution the coil member goes through the magnetic field twice and the lines of force are cut by the coil. The intensity of the current varies according to the position of the armature, being strongest where the magnetic pull is the greatest. The direction of the current is reversed each half-revolution as previously explained.

One end of the coil is attached to the end of the iron core which is grounded when attached to a motor car by the metal of the base of the instrument. The other end of the wire coil is insulated by a ring of non-conducting material. The current generated is collected from this ring member by a brush led to a distributing plate, thence to the proper spark plug, and back to the coil by the way of the metal of the car.

The electro-magnets utilized with dynamos are made by placing a bar of soft iron, wrought or cast, within a coil of insulated wire through which a current of electricity is passing. The magnetic lines of force about the wire pass through the iron and convert it into a magnet. When the flow of current is stopped, however, the magnetism almost instantly leaves the iron bar which returns to its original condition. A faint trace of magnetism remains, called residual

Digitized by Google

magnetism, and this is present more or less in all iron or steel. This assists to a certain extent in the operation of the generator. The strength of the electro-magnet depends upon the number of turns in the wire coil and the strength of the current passing through it.

In the lighting dynamo the current generated is usually direct; that is, it flows in one direction all of the time. At Fig. 2 is presented the wiring plan of a dynamo and the components are outlined. It will be noted that the armature rotates upon the longitudinal centre line of its core and carries a large number of coils of wire placed in planes, which pass through the longitudinal centre line of the core, and these coils are so distributed that they cover practically the entire outer surface of it.

At one end of the core is located the commutator, which consists of a number of segments of a cylinder made of copper, insulated from one another and connected, in pairs diametrically opposite, with the ends of the various armature coils. With a bipolar machine, two brushes make contact with the surface of the commutator, one on each pair of segments, forming electrical contacts between the outside circuit and each of the armature coils successively as the armature is rotated.

Assume that the field magnets are already energized when the armature is rotated by belt, chain, gears, etc., and that the magnetic lines of force are flowing across the gap between them and through the armature core from one pole to the other. The movement of the armature coils within this magnetic field sets up an electric current within them, which is collected by the brushes and sent through the outside circuit.

A part of the current, however, is shunted in practise, that is, run from the brushes in the same way as the outside circuit, and is passed through the field windings to energize the electro-magnetic field pieces. Just so long as the armature is kept revolving, so long will an electric current be generated if the exterior circuit be kept closed. The faster the armature is revolved the greater is the amount of current delivered to the field coils, the stronger becomes the magnetic field and greater the output of the generator. When utilized for lighting a motor car a device, either mechanical or electro-mechanical, is incorporated to prevent the high speeds which would tend to burn or fuse the windings.

Dynamos utilized for motor car lighting may be series wound, shunt wound or compound wound.

Timing Renault Motor.

(1454)—I have a Renault car which is about eight years old and would like to secure the timing plan.
W. H. G.

Lawrence Mass., Nov. 11.

The timing plan of the Renault mentioned is not included in the files of The Automobile Journal. The Renault Freres Selling Branch, Inc., 57th street and Broadway, New York City, will doubtless supply the desired information.

Mean Effective Pressures.

(1455)—What is the mean effective pressures of standard automobile motors and what is meant by the thermal efficiency of an engine? STUDENT.

Cambridge, Mass., Nov. 14.

In modern automobile motors the mean effective pressure is about 71 pounds a square inch. This pressure has increased since the beginning of the automobile industry, but in a lesser proportion than the speed. It varies with the size of the motor. Thus, in a current type of motor with

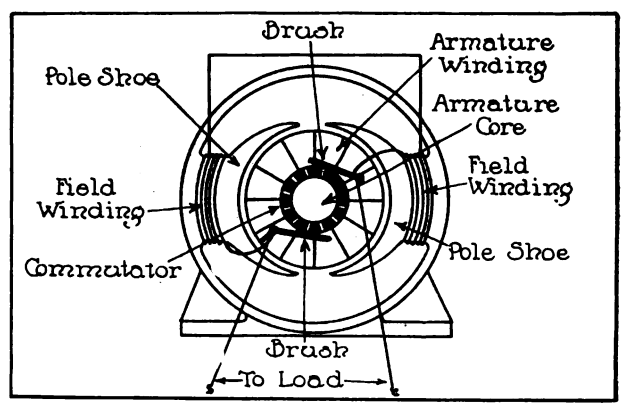

Fig. 2—Showing the Wiring Plan of Components of a Dynamo.

cylinders having a 2.4-inch bore and 4.8-inch stroke, it attains about 57 pounds to the square inch. In a motor having a bore of 3.2 inches and stroke of 5.2, it is 71 pounds to the square inch. That of a motor having a bore of 4.4 inches and stroke of 5.6 inches is 85 pounds to the square inch, all other things being equal. This is at 1000 revolutions a minute. The mean effective pressure increases as the result of increased compression. It decreases as the number of revolutions a minute decreases.

The thermal efficiency of a motor, by which is understood the ratio between the work done and the thermal energy contained in the fuel consumed, is about 14 to 15 per cent., corresponding to a fuel consumption of one-eighth of a gallon a horsepower-hour.

The mechanical efficiency, by which is understood the ratio between the work actually

Digitized by Google

done to the energy expended on the piston by the expanding gases, is approximately 70 per cent. The efficiency of transmission or the work done at the wheel rims as compared to that delivered at the crankshaft is generally conceded to be about 75 per cent.

Annealing Boxes.

(1456)—Kindly give me the address of concerns making boxes for annealing and case hardening.

REPAIR SHOP.

Hartford, Conn., Nov. 15.

There are several concerns manufacturing the boxes named. Among those listed are: The Wilfong Iron Works Company, Philadelphia; the National Manufacturing Company, Pittsburg, Penn.; Knox Pressed & Welded Steel Company, Pittsburg, Penn.; and the Leetonia Boiler Company, Leetonia, O.

An easily constructed and inexpensive sheet metal box may be made as described and illustrated in the issue of The Automobile Journal for Aug. 25. The article also contained information as to its operation and suggestions concerning case hardening.

Firing Order of Six-Cylinder Motors.

(1457)—What is the firing order of the Pierce-Arrow six-cylinder motor, and do all six-cylinder engines fire alike? W. E. WHITEHALL.

Washington, Ill., Nov. 11.

The firing order of the Pierce-Arrow six-cylinder motor is 1-5-3-6-2-4. The firing order is not alike with all motors and it may be arranged 1-3-2-6-4-5, 1-3-5-6-4-2, or 1-4-2-6-3-5, depending upon the design or make. Of 11 leading makes, four fire as does the Pierce-Arrow.

Mufflers and Power Loss.

(1458)—I noticed in your book that with the use of a cut-out on the muffler, either open or closed, the power of the engine was not affected. Another publication states that there is a loss of power with a muffler closed. Which is right? INFORMATION.

New Haven, Conn., Nov. 16.

The article referred to dealt with a particular test the result of which showed that with a properly designed muffler and with no cut-out open, the loss of energy was very small, so much so that it would appear that no material benefit were derived with the utilization of the cut-out. On the other hand tests conducted by another laboratory developed a loss varying from 1.3 horsepower to 2.5 with 600 to 1300 revolutions of the motor.

There is no doubt that there is a slight loss which will be augmented with a poorly designed muffler or one that is choked with carbon, etc. There is a growing tendency to discourage the use of cut-outs and in many cities ordinances are in vogue prohibiting their utilization. There is no reason why the motor should not deliver its maximum efficiency with a muffler, provided the latter is well designed and is free from unnecessary obstructions.

From the Passenger's Viewpoint.

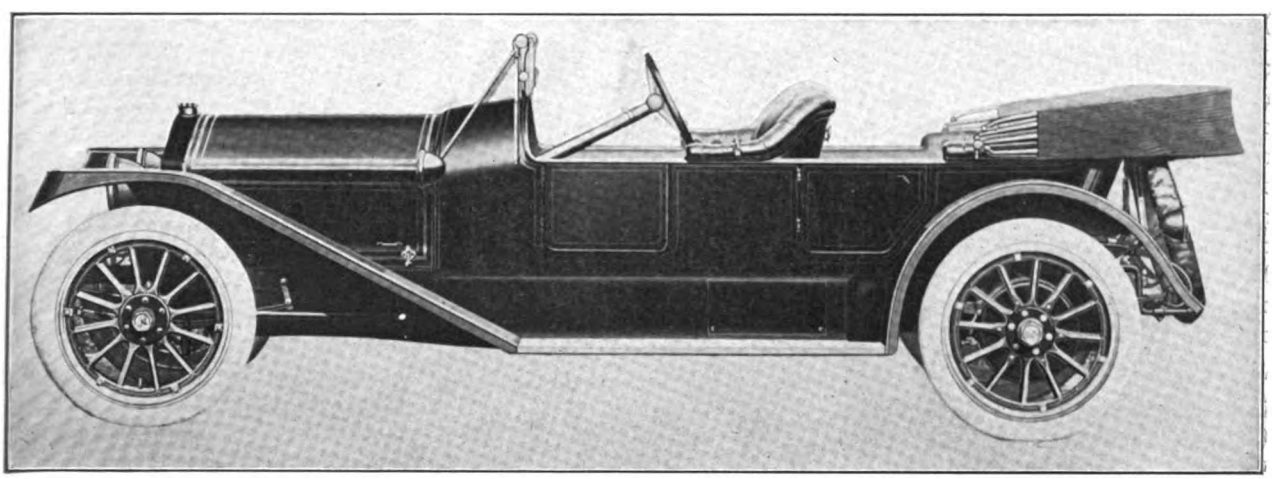
(1459)—I frequently see in your publication, remarks especially for chauffeurs, and concluded that through this same channel I could reach the attention of men who are driving just for the weekly stipend without any thought for the comfort of the passengers. They seem to think it a great feat that they have always torn around corners and thus far skillfully (?) avoided an accident. They do not seem to appreciate that it is to their discredit that when a passenger requests them to go slower, they set up the argument that they are not going fast, instead of immediately lowering their speed and saying nothing. While the speed probably is not fast to them, the passenger may be unusually nervous and consequently feels the momentum more than the driver. These chauffeurs are men of excellent habits and fine mechanics, but have not learned the value of self-effacement. AN OLD SUBSCRIBER.

Boston, Nov. 11.

A LITTLE TIRE HISTORY.

It appears that the present day non-skid tire is an evolution from the vacuum rubber flesh brush, and that A. E. Morrison, once noted as a bicycle racing rider and now western sales manager of the R-C-H Corporation, maker of R-C-H cars, is responsible for its adaptation to the automobile. In 1898 a widely known manufacturer of rubber goods decided that his flesh brush idea might be applied to the bicycle tire. He got into touch with Morrison and equipped his bicycle with his new non-skid tires. The latter went from coast-to-coast demonstrating their value in various racing events.

Six years later Morrison had won fame throughout New England as an automobile racing driver. He recalled his experience with the non-skid bicycle tires and decided to try them on his car. The manufacturer of 1898, to whom he unfolded the proposition, declared he did not have the necessary capital, and Morrison offered to pay for the molds, the two rough tread tires to be ready for his race at Readville, Mass., May 30, 1904. That day he won two five-mile events, going the distance in 6:00, a remarkable record for the time, in a touring car with body.



In view of this interesting resume, it is not strange that Morrison was able to induce the R-C-H Corporation to equip its 1913 model with non-skid tires all around. It is stated that this is the first instance in which a moderately priced car has thus been fitted as regular equipment.

IMPROVED SERIES V NATIONAL CARS.

In keeping with its policy of discontinuing the yearly model, the National Motor Vehicle Company, Indianapolis, Ind., is offering a new series termed the Improved Series V, including five designs, one more than last year. The models are: Semi-racing roadster, speedway roadster, toy tonneau, five and seven-passenger touring cars. In the line are also included limousines, coupes and sedans.

The toy tonneau shown in an accompanying illustration is provided with a long stroke motor having enclosed valves, left hand drive and centre control. The ignition is by a Bosch dual double magneto and carburetion is by a multiple jet vaporizer. A full floating rear axle is employed and well designed springs and luxurious upholstery contribute to its easy riding qualities.

The Toy Tonneau Model of the Improved Series V National Line.

The equipment is unusually complete, including a Gray & Davis electric lighting dynamo and motor starter, the latter operated by a push button; power tire pump, demountable rims, tire carriers, speedometer, windshield, mohair top, cover and side curtains, robe rail, foot rest, etc.

NEW FORD POLICY.

In an effort to eliminate price cutting and to protect dealers in their respective territories, the Ford Motor Company is taking full advantage of its patent rights by affixing to every Ford car that leaves the factory a special restrictive patent license plate. This is mounted on the dash, just above the steering post, and after giving a list of the Ford patents, reads as follows:

"This Ford car is sold subject to restrictions as to price at which and territory within which it may be sold or delivered. Any violation of such restrictions makes the seller or user an infringer of said Ford patents and the title of this car reverts to the Ford Motor Company. The purchaser of this Ford car agrees at time of purchase to register his or her name, address, date of purchase and above car number with the Ford Motor Company at Detroit, Mich., U. S. A., as the owner of this automobile in order to be protected under the warranty of the manufacturer."

NO BOSCH EXHIBIT AT SHOWS.

For the first time since 1909, the Bosch Magneto Company, New York City, maker of Bosch magnetos and plugs, will not be represented at either the New York or Chicago show. This decision was reached early in the month and cancellation of the spaces allotted to the company by the Motor & Accessory Manufacturers followed almost immediately. It is explained that this move was made necessary by the fact that the spaces assigned were found to be entirely too small for a proper display of the company's products, which include over 200 types. In lieu of representation at the shows, special displays will be arranged at the offices of the company during the progress of the exhibitions. The New York Bosch exhibit will be found at the main office, 223-225 West 46th street, and that at Chicago, in the local branch on 24th street near Michigan avenue. Manufacturers and others are invited to visit these displays and obtain full information concerning Bosch ignition, ample room being provided for a special investigation of the entire subject.

NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

The Standard Tire Tool is manufactured by the Standard Tool & Supply Company, 42 West 15th street, New York City, and will appeal to motorists who have experienced difficulty in removing a shoe which has become rusted or frozen to the rim. A pair of arms encircles the shoe, these being provided with recesses which engage with the bead of the tire and rim. The upper portions of the movable arms carry a toggle mechanism mounted upon a threaded bolt secured to the arm members. A handle having a threaded portion is rotated upon the bolt member which in turn imparts movement to the toggles and arms, causing the latter to contract and force the shoe away from the rim. The maker states that it will start the most stubborn tire and that it is guaranteed against breakage. It is made in two sizes and is designed solely for quick detachable rims.

—— ★ ——

The Cukor Safety Crank is designed for attachment to the crankshaft of the motor and to replace the usual handle, the maker claiming that it may be installed easily in a few minutes and without any alteration to the shaft. It is simple in construction, having but two parts, a ratchet and pinion, and its design is such that it does not detract from the appearance of the machine. When the motor is cranked a pinion engages with a ratchet, the latter being actuated by a plunger member. Any backfire or reverse movement is compensated for by the pinion automatically breaking contact with the ratchet. The plunger member also is disengaged with the motor shaft, allowing it to rotate, although the starting handle remains stationary. The device is manufactured by the Cukor Safety Crank Company, 58th street and Broadway, New York City.

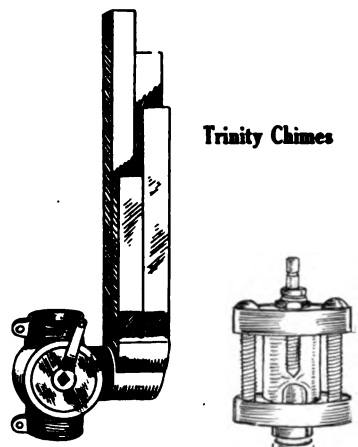
—— ★ ——

The Dean Regulite, marketed by the Waite Auto Supply Company, Providence, R. I., is an electrical device for utilization upon model T Ford automobiles when the magneto is employed as a source of current for lighting the headlights. With this type of generator the voltage varies with the speed of the motor and if the lamps are not of proper size, at high motor speeds they are likely to become damaged. The Dean Regulite regulates the voltage, its principle being that of resistance in the circuit, and it is so designed that a steady light is provided at different speeds, the lamps being protected from excessive voltages. The switch member has four steps or contacts to enable the adaptation of the system to generators of varying output of current. Another quality of the device is that it permits of dimming the lights when operating in the city. The Regulite is neatly constructed, takes the place of the usual lighting switch, and may be located upon the dash or in any other convenient place. It is moderately priced.

—— ★ ——

The Gasosava is the product of the Gasosava Company, Inc., 1270 Broadway, New York City, and is a device which is inserted between the carburetor and intake pipe or manifold. Its function is to assist in the complete vaporization of the fuel, and the maker holds that a decided

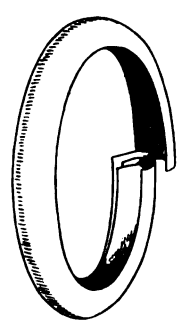
Digitized by Google



economy is effected by its use. It differs from the usual devices of this nature in that it is fitted with a wick like screen which is so proportioned and constructed that the fuel is broken up as well as effectually screened. The maker states that after installation it is essential to restrict the opening of the needle valve as less gasoline is required to maintain the maximum efficiency of the motor.

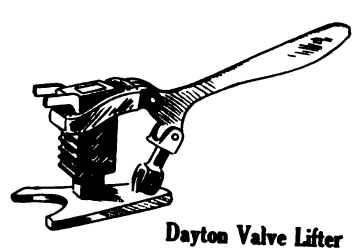
—— ★ ——

The Trinity Chimes Horn, for motorcycles is operated by the exhaust of the motor and it is said that a beautiful four-tone chime is obtained by the construction of the square brass tubes, four of different length being employed. Each tube is slotted in a manner similar to the pipes of an organ. The horn is connected on the exhaust pipe between the motor and the muffler and a cut-out valve is incorporated, which is actuated by a wire cable secured to a pedal near the driver. The tone of the signal may be varied by the opening of the valve member. It is marketed by the Waite Auto Supply Company, Providence, R. I.

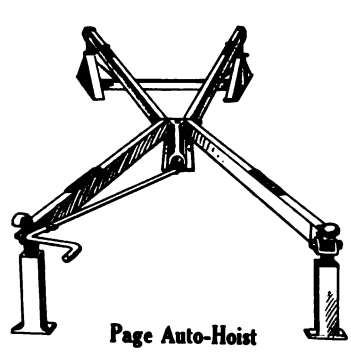


—— ★ ——

The Hemmeter Spark Gap, produced by the Hemmeter Spark Gap & Specialty Manufacturing Company, Pontiac, Mich., is a device which may be attached to any standard type of spark plug, its function being that of an auxiliary gap. By it the points of the plug are cleaned, as the flow of the secondary current is interrupted and built up sufficiently to overcome the resistance at the auxiliary gap. The current jumps the latter, increasing the intensity of the flame at the gap of the spark plug. The auxiliary member is composed



Trinity Chimes



Hemmeter Spark Gap

Kant-blo Innerliner

Dayton Valve Lifter

Page Auto-Hoist

of two pieces of fibre which are countersunk to take a section of glass tube, secured through the medium of two screws. The fire pin is adjustable as are the fibre pieces. A quality of the device is that it enables the observance of the spark.

—— ★ ——

Kant-blo Innerliners are marketed by the Hampton Manufacturing Company, 1520 West Washington street, Indianapolis, Ind., and features claimed of these members are that they are self-vulcanizing and do not creep, chafe or buckle, creating damage to the inner tube. They are constructed of a layer of specially treated chrome leather placed between two layers of high grade Egyptian fabric and the materials are so placed together as to form a single yet flexible piece. The ends are lapped to facilitate installation.

—— ★ ——

The Dayton Valve Lifter is manufactured by the Dayton Malleable Iron Company, Dayton, O. Qualities emphasized of the tool are that it may be operated by one hand and that it automatically locks into position upon the valve spring being compressed. These are made possible through a ratchet and pawl mechanism, the operating lever being provided with teeth registering with similar members on the stem of the tool.

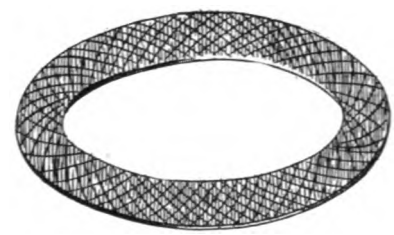
—— ★ ——

The Page Auto-Hoist, manufactured by the Page Auto-Hoist Company, Grand Rapids, Mich., is designed for jacking up the car, thereby relieving the tires of its weight when the machine is not in service, or repairs or adjustments are to be made. It occupies but little room in the garage. The machine is run over it and by

Digitized by Google

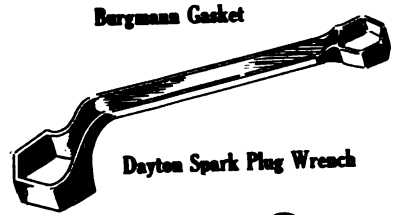
rotating a handle the car is hoisted free from the floor. It is claimed that but little exertion is required to work the hoist and that a child may complete the operation in 10 seconds. It is made in differing sizes for varying wheelbases.

—— ★ ——



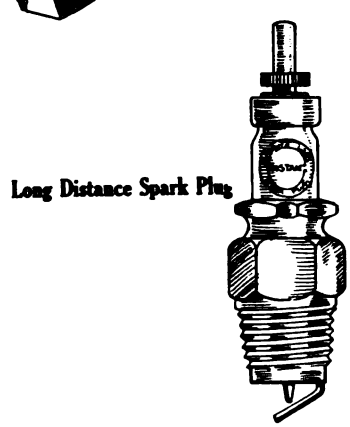
Burgmann's Gaskets are manufactured by Feodor Burgmann, 5 Beekman street, New York City, and are constructed in varying sizes to meet individual requirements. They are made of a high grade asbestos cloth, with and without wire insertion, as well as graphited or ungraphited. They are designed to withstand high temperatures and moisture, and are made in different thicknesses. The maker also produces Janos sheet, a high grade packing particularly adapted to motor work, and Joudol "M," a packing lubricant.

—— ★ ——



The Dayton Spark Plug Wrench, manufactured by the Dayton Malleable Iron Company, Dayton, O., is designed for service where the ordinary straight handled tool cannot be employed successfully, the shape of the tool being such that it is possible to reach and loosen spark plugs and nuts located in recessed sections. A quality of the wrench is that it will fit either .875 or 1.125-inch plugs and its long handle makes it possible to exert considerable leverage. The tool is made either in nickel or Japan finish.

—— ★ ——



The Long Distance Spark Plug, marketed by the Long Distance Spark Plug Company, 212 South Illinois street, Indianapolis, Ind., is designed to withstand severe service and among its qualities is the construction of the porcelain and terminal. The former is provided with a rounded shoulder around which is fitted an expanding metal thimble which is compressed by a bushing, making for a gas tight joint, as well as preventing opportunity of blow-outs. The terminal screws onto the electrode, permitted the use of connections of the closed end type, and the exterior of the plug terminal is recessed, allowing the fitting of the clip connectors. The plug is marketed with a very liberal guarantee.

Dayton Spark Plug Wrench

Long Distance Spark Plug

Martin Strap Adjuster

Ferromatic Tire

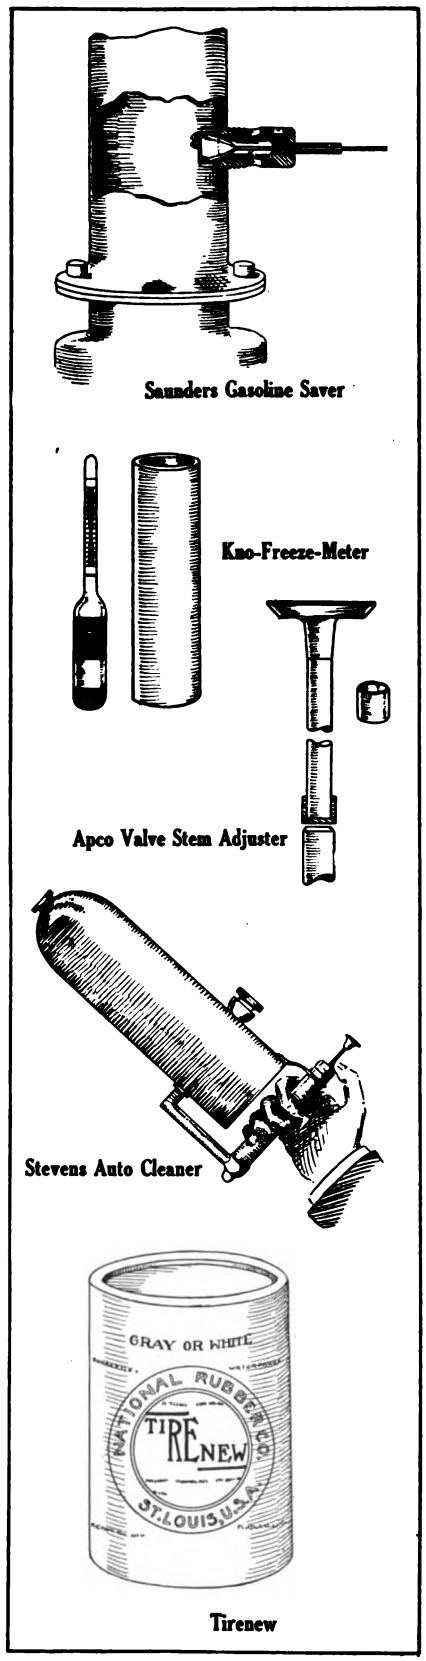
—— ★ ——

The Martin Strap Adjuster will appeal to motorists who have experienced difficulty in attaching the top strap hook members to the eyes of the frame member when the top is raised. Sometimes it is necessary to exert considerable energy to accomplish the operation and the top and bows are strained. The Martin device is so constructed that its locking mechanism may be loosened easily and quickly, the strap lengthened and the hook snapped into place. The adjuster is then locked to its original position. Two comprise a set which is moderately priced. The device is made by the Martin Manufacturing Company, 515 Vine street, Cincinnati, O.

—— ★ ——

Ferromatic Tires are the product of the Ferromatic Tire & Manufacturing Company, Cleveland, O. They are designed to fit any standard type of wheel utilizing quick detachable or clincher rims, also some designs of demountable rims. A solid rubber tread is fitted over a metal shell and diagonally placed steel springs replace the usual compressed air of the inner tube. The device is secured to the felloe of

Digitized by Google



the automobile wheel by a channel member. The sides of the outer shell lap over those of the channel section and water and dirt are eliminated by leather packing rings. The springs are placed tangently to the felloe of the wheel and are so constructed that they never act in tension.

★

The Saunders Gasoline Saver, manufactured by the Leslie R. Saunders Company, Los Angeles, Cal., as the name implies, is designed to make for economy of fuel. The principle involved is that of diluting a rich mixture by introducing auxiliary air into the intake manifold above the carburetor. The pipe is tapped and threaded to take the air regulator valve which is provided with air passages, but these are controlled by a taper plunger actuated by a flexible cable. The latter is led to the steering column where a control switch member is installed, permitting the driver to change the position of the taper plunger, thereby increasing or decreasing the amount of atmosphere admitted. This arrangement, the maker holds, economizes fuel and increases the efficiency of the motor.

★

The Kno-Freeze-Meter is marketed by C. J. Tagliabue Instrument Manufacturing Company, 396 Broadway, New York City, and is designed especially for testing anti-freezing solutions in which alcohol is employed. The meter is provided with a graduated scale, indicating the different temperatures of the solution, and to use the device a little fluid is drawn from the radiator in a special glass jar. The meter is then floated and the scale indicates the temperature at which the mixture will freeze. A box is provided for carrying the meter and jar.

Saunders Gasoline Saver

Kno-Freeze-Meter

Apco Valve Stem Adjuster

Stevens Auto Cleaner

Tirenew

★

The Apco Valve Stem Adjuster is marketed by the Auto Parts Company, Providence, R. I., and is constructed for model T Ford cars. It comprises a thimble like cap of hardened Jessops steel and a number of very thin hardened discs. It is designed for attachment to the valve stems when these members have become worn and do not provide the proper lift to the valves. They are made in three sizes, that for the Ford motor being .4375 inch.

★

The Stevens Auto Cleaner is the product of the Stevens Manufacturing & Supply Company, 1223 Wabash avenue, Chicago. It is a compact device operated on the compressed air principle and is designed to produce a fine spray or a dynamic stream of gasoline, kerosene or other cleansing fluid. The handle forms the plunger pump, a few strokes of which develops sufficient pressure for the entire contents of the vessel. Although constructed for removing grease and dirt from the automobile, it may be employed for cleansing clothing.

★

Tirenew is manufactured by the National Rubber Company, Inc., 4414 Papin street, St. Louis, Mo., and is a coating for automobile, motorcycle and bicycle tires. The maker states that the base of the composition is pure Para rubber and that being in liquid form it is applied easily to the exterior of the shoe after the latter has been cleaned. It also is pointed out that not only does the preparation preserve the rubber, but the appearance of the tire is improved by its use.

MAKING NIGHT DRIVING SAFER.

From a large number of states comes the information that the legislatures which meet this winter will be called upon to consider bills requiring lights on all vehicles using the highways during the hours of darkness. In many instances organized motorists are preparing the bills, and it must be assumed that they will have the unlimited assistance of all automobile owners and users. While there is much reason for believing that there will not be the strenuous opposition that has made itself apparent in former years, it will not be sufficient to let the case go by default.

The people of Connecticut are aroused at this time by a particularly sad accident. It seems too bad that any commonwealth should delay action upon this important matter until fatalities of this character make it compulsory for its legislators to take steps looking toward the improbability of such accidents.

Incidentally, it may be remarked that in certain sections of Massachusetts, which state has a particularly satisfactory law, there has been sufficient violation of the statute to occasion editorial comment. That the provision is a wholesome regulation is now generally conceded. Compliance therewith entails no hardship, and protects the occupant of the horse drawn vehicle as well as the motorist.

PROTECTING THE DEALER.

That the business methods attendant upon the sale of automobiles, whether for pleasure or commercial uses, must undergo a decided change has been evident for some time. The modern motor car is an important factor in present day economics. Machines must be sold on their merits and because a wholesome demand has been created for them. The salesman who is unable to recognize this situation has no place in an industry which within the past few years has reached a high position among the important industrial activities of the country.

The action of the Ford Motor Company in affixing to every car which leaves the factory a special restrictive license plate, is not only a decided protection to Ford dealers, but is a move toward a business permanency which cannot help but have a satisfactory effect upon the entire industry. The plan is not unlike that which has been in vogue with certain restricted automobile accessories, and one which has aimed toward the establishment of a recognized trade mark—at the same time a protection to manufacturer, dealer and owner.

Under the new plan Ford dealers, no matter where located, will be protected in their respective territories. There will be no possibility of price cutting, a condition which is particularly disastrous to any form of business endeavor, and no dealer will be permitted to solicit business outside of the territory allotted to him. The result will be that of building up a splendid sales organization, which not only will be a credit to the factory represented, but to the industry as a whole.

REGARDING PARCELS POST.

Since the announcement of a domestic parcels post, to be established Jan. 1, 1913, there has been a tendency to assume that the United States government was about to demand motor vehicles with which to carry out its plans. It goes without saying that if the industry were called upon

Digitized by Google

to supply all the cars needed to take care of this immense business, the factories would be compelled to work night and day for months. Naturally, this situation has had the effect of holding up orders from business men and others, through a fear that they might not be able to secure trucks.

It is only necessary to point to the fact that the postoffice department has an appropriation of but $750,000 with which to secure the necessary special stamps, sacks, maps, etc. It hardly will be contended that the balance will go far toward equipping the nation with motor vehicles. The plans are by no means fully formulated, and it is not even known whether the government will ask the present carriers to assume the added burden of delivering the parcels post or this will be contracted for, somewhat after the manner of the present so-called star route system.

It would seem logical that eventually motor trucks will be handling the parcels post business of the country, but from present indications there is little reason for fearing that the industry is to be seriously inconvenienced in filling the orders.

LEGISLATION IN NEW YORK.

That there was to be attempt to amend the existing motoring law in New York State was foretold in the agitation which developed in New York City earlier in the year. The main object is to provide some means for proceeding against those who operate their machines recklessly and without due regard to the rights of other users of the highway. Several of the proposed amendments obviously have this for their purpose.

The proposition to give state automobile inspectors the power of constables is not limited to New York, other commonwealths having in mind similar action. There appears to be a wide difference of opinion as to the efficacy of this plan as a solution to the problem, but it may prove worthy of trial. Certainly, something must be done to protect the motorist, as well as the pedestrian, from the dangers attendant upon reckless driving, but it is to be hoped that the state constabulary will exert every effort to bring the real culprits to justice.

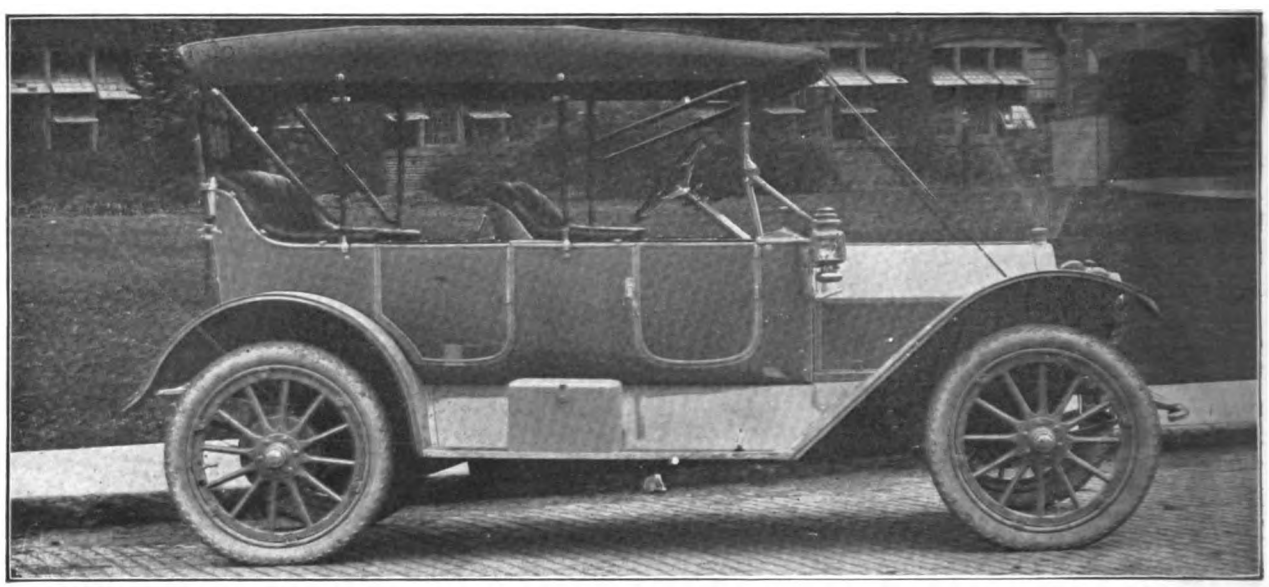
Non-resident motorists will be interested in the reciprocity amendment, which apparently is patterned somewhat after that now in force in Connecticut. The provision to base the registration fee on a flat horsepower rating will bear watching, if it is proposed to increase the fees in the manner suggested by the bill considered by the Massachusetts legislature of 1912.

Motorcyclists will be particularly interested in the propositon to place them under the provisions of the motor vehicle law. At present, each town and city throughout the state has its own regulations applying to the two-wheeled mount, and these have been a source of much annoyance to touring motorcyclists.

GOOD ROADS IN THE WEST.

That the commonwealths of the Far West and on the Pacific Coast are giving every attention to the construction of good roads is borne out by the announcement that two more states have adopted ambitious programmes. Idaho has appropriated $3,000,000 for this purpose and Arizona has prepared a very comprehensive plan. Washington, Oregon and California will continue the work begun last year. British Columbia is doing its part, and Mexico is beginning to take an interest in the matter. Even Alaska, with plans for a local self-government well under way, has taken steps to bring about road development. The Seattle Post-Intelligencer sums up the situation as follows:

> The time is not remote when everybody on this continent will recognize the beauties of travel on this coast. The automobile is here. It is here to stay. The automobile is cheapening. In a few years it will be as common and as simple in its mechanism as the old spring wagon. That will be the logical outcome of present efforts to improve and cheapen automobiles. Trust or no trust the tire problem, now a heavy element in the cost of automobiles, will be solved. That will mean a great deal. * * * We want good roads and we mean to have them.



CO-OPERATION OF RAILROADS.

The co-operation of the railroad corporations, demonstrated at the recent meeting of the automobile manufacturers in Detroit, is indication that the importance of this industry is to be recognized in the future. The figures presented at that meeting clearly indicate that the number of freight cars available is by no means commensurate with business done, and steps should be taken at once to eliminate the defiiciency.

THE LAMBERT MODEL 99, A FINISHED PRODUCT.

THE Buckeye Manufacturing Company, Anderson, Ind., will build a number of vehicles for the season of 1913, which will include the model 99 Lambert chassis, fitted with five-passenger bodies; model 10 and model 40 Buckeye chassis, to be equipped with five-passenger touring bodies, and 1500, 2000 and 4000-pound delivery wagons. All of these machines will be built with the well known Lambert friction drive or transmission, a construction so well known that it is regarded as a standard. In this the usual gearset is replaced by a driving disc and a driven wheel, and a jackshaft, and the power is transmitted to the rear axle by a silent chain enclosed in a case and operating in a bath of oil.

The Lambert Model 99, a Five-Passenger Touring Car with 117-Inch Wheelbase That Will Be the Leader for 1913.

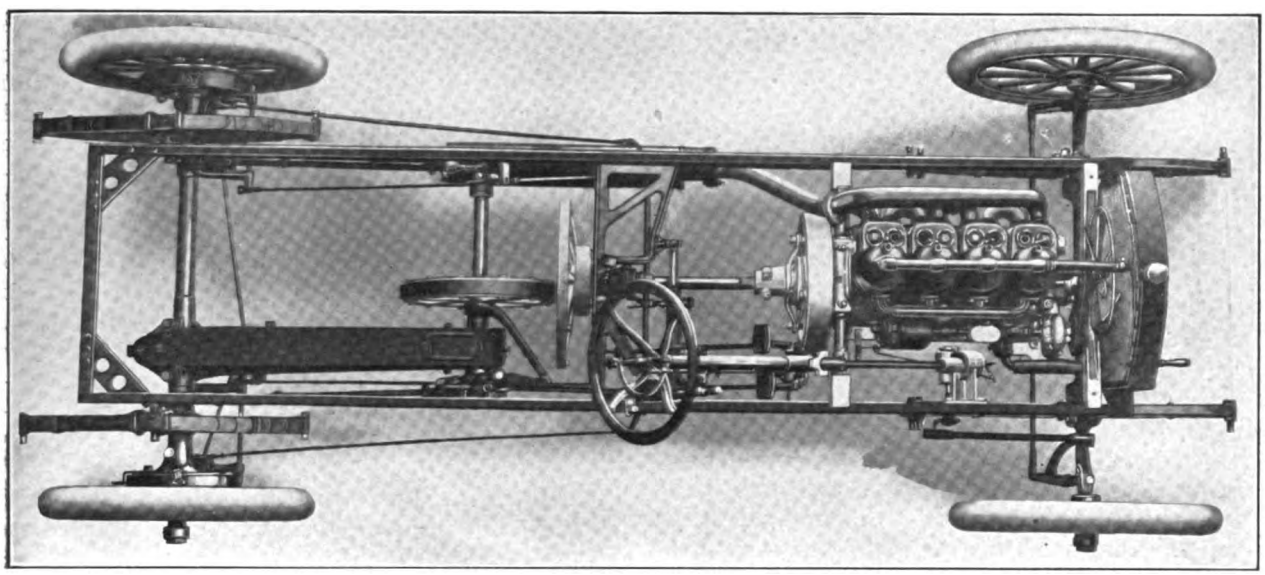
The Lambert form of drive or transmission is not new. It has been built by this firm for 12 years and has been tried under every conceivable condition of operation. It is claimed by the maker that with it the motor may be operated at a constant speed—that which will afford the greatest efficiency—and that every variation of vehicle movement can be obtained, from the slightest motion to 50 miles or more an hour. The system has been patented by J. W. Lambert, and besides its successful use in motor road vehicles it has been used for driving gasoline motor street cars, in which 150 horsepower has been developed, and which weigh 11 tons without load and seat 35 passengers.

The efficiency of the Lambert drive has been demonstrated in many ways because of the skepticism of those directly interested in its possibilities. Lambert cars have been driven up and down inclines with a 50 per cent. gradient, it being necessary to construct trestles of wood to make these demonstrations, and they have climbed and descended long flights of steps with a certainty that was surprising. It is maintained for these machines that not only is the driving system as reliable and dependable as any other form, but it is thoroughly in accord with sound engineering and will transmit any power desired. Besides this it has the quality of affording the extreme variation of vehicle speed that can be obtained in no other manner with the full power of the motor at all times.

This description will deal with the chassis of model 99 in detail, and as there is no departure from the principles of design with the other machines it may be regarded as a reasonably sufficient description of the other productions.

The motor is a Rutenber production, which is a standard with gasoline engines, and it is built with the guarantee of a concern that has developed and specialized motors with the purpose of obtaining the greatest efficiency and economy of operation. The motor is conventional in every aspect and in all details has been tested to establish endurance and capacity. It is a four-cylinder, water-cooled, vertical L-head engine of the four-cycle type, having a rating by the S. A. E.

Digitized by Google



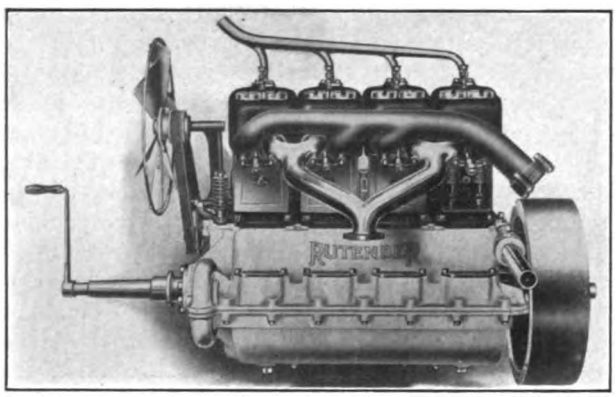
formula of 27 horsepower, but it is claimed by the manufacturer that its production will range from 35 to 40 horsepower. The maximum speed is 1800 revolutions a minute.

The cylinders are cast single of semi-steel with the water jackets integral, these being of such size as to insure effective cooling under all conditions of operation, and under each valve pocket is a continuous web in which is installed the valve operating mechanism. These recesses are covered when the motor is assembled. The valves are at the left side of the engine and the pockets are covered with large caps. The water inlets and outlets are liberal in size and insure the complete cleaning of the water chambers of fins, ribs or core material that might obstruct a free flow of the cooling liquid. The cylinder units have wide base flanges, which afford very substantial anchorage on the engine case. The bore is 4.25 inches and the stroke 5.25 inches, this giving a bore to stroke ratio of 1 to 1.235.

The aluminum crankcase is a barrel type, divided longitudinally, and assembled by an unusually large number of bolts fitted into bosses to give additional strength. The forward end of both sections is extended to form a housing for the timing gears. The five main bearings and the camshaft bearings are carried in the upper half and the lower portion constitutes an oil reservoir. In this section are two drains and there is a sump at the base of the oil pumping system.

The cylinder units are bored, reamed, aged and ground to exact size, and the pistons are turned and ground to limit gauges, while the crankcase is very accurately machined. The construction is very substantial and is intended to be long enduring, for strength has not been sacrificed to lessen weight. At the front of the crankcase is a long swivelled arm that supports it in the chassis, and at the rear in heavy lugs is a steel tubular member, which is fixed by set screws, on which the motor is mounted. This affords practically a three point suspension. In the centre of each recess below the valve pockets of the cylinder units is a long cast lug, into which a hole is drilled and tapped, and to these the cover plates are secured by bolts with winged heads.

The pistons are of the same material as the cylinders and are of unusual length. They are each fitted with four eccentric compression rings of the lapped type, three of which are above the wristpin and the fourth at the wristpin, and at the bottoms of the pistons are three oil rings. The ring channels are carefully cut and the rings are ground on the edges and peripheries.



The Lambert Model 99 Chassis, Showing the Complete Assembly, the Friction Drive Transmission and the Enclosed Driving Chain.

The crankshaft is a 40 carbon manganese steel drop forging 1.625 inches diameter, that is carefully ground to size and heat treated. The rear crankshaft bearing is 3.75 inches length and the others are 2.065 inches length. The bearings are of Hoyt's alloy nickel babbitt and are anchored in the upper section of the case with heavy bolts and secured by nuts and cotter pins. The crankpins are 2.065 inches length and the bearings are of the same material as those of the crankshaft. The wristpins are of seamless steel tube 1.25 inches diameter, hardened and ground

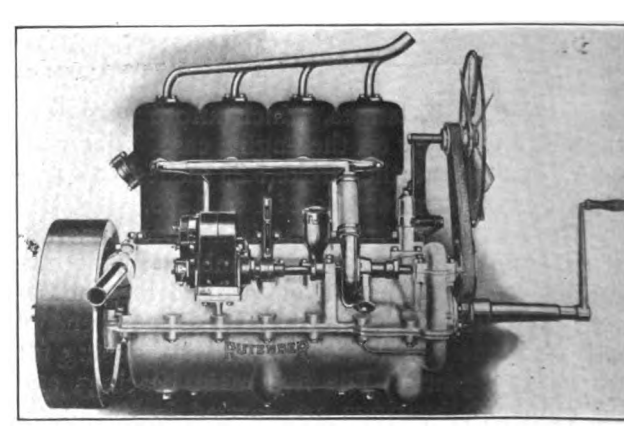
Digitized by Google

to size, and are secured in the piston bosses. The wristpin bearings are 2.25 inches length and are of Hoyt's alloy nickel babbitt. The big ends of

Left or Valve Side of the Rutenber Motor.

the connecting rods are fitted with flanges and dowels and are secured by bolts, nuts and cotter pins. The camshaft is a steel drop forging with three bearings, ground to size and heat treated, with the cams integral. The phosphor bronze bearings are mounted in the upper section of the crankcase.

The valve ports are two inches diameter and the valves are drop forgings with heads and stems of steel. There is sufficient clearance to insure complete scavenging of the cylinders and full charges of fuel gas. The valve guides are of cast iron. The valve tappets are of hardened steel and operate in bronze guides inset in the base flanges of the cylinder units. The tappets are fitted with hardened screws and nuts to afford accurate adjustment to compensate for wear. The valve springs are large and oil tempered and are retained by collars and keys. The mechanism is enclosed by steel cover plates to prevent the accumulation of abrasive substances. The crankshaft timing gear is integral with the shaft and the other gears are of semi-steel, helical cut to insure noiseless operation.



The water circulation system has a capacity of four gallons, that is circulated by a centrifugal pump through a vertical tube radiator. The pump is driven by an outside shaft at the right side of the motor, the gear being enclosed. The radiation is insured by a six-bladed fan mounted on a ball bearing in a bracket installed on the forward extension of the crankcase, and driven by a flat belt from a pulley carried on the pump shaft. The belt tension is maintained constant by a helical spring that is adjusted by a winged nut. The water manifolds are large, the inlet being secured to the cylinder units by cap screws, and the outlet is fitted with unions similarly retained to the centres of the cylinders.

The motor is lubricated by a combination of splash and mechanical force feed. The capacity of the reservoir in the base of the crankcase is two gallons. The oil is drawn through a screen surrounding the well in the base by a gear driven pump and is forced through a system of tube to flush all of the main bearings. The overflow forms in pools beneath the crankthrows, and scoops on the big ends of the connecting rods distribute the lubricant thoroughly over the crankpins, wristpins, camshaft bearings, cams, valve tappets, piston and cylinder walls, and the overflow from the forward main bearing lubricates the timing gears. There is a large filler at the right side and a gauge that indicates the height of the oil in the reservoir.

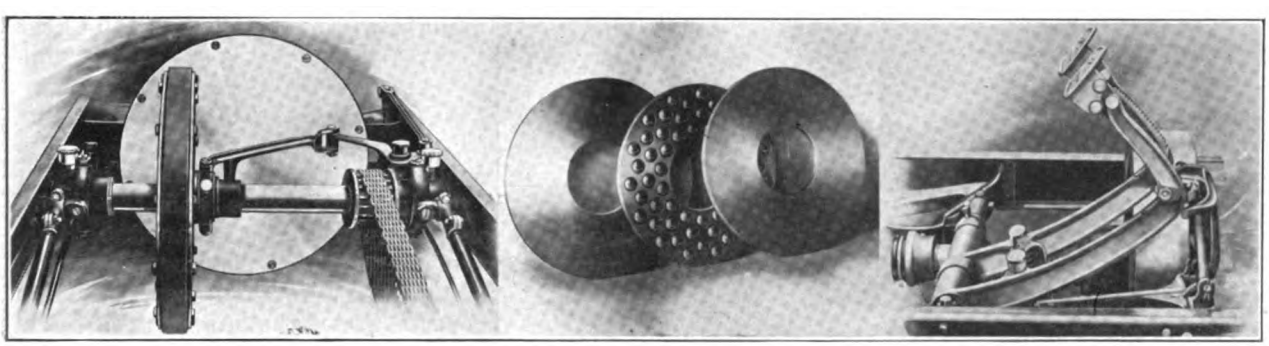
The fuel is vaporized by a carburetor of standard make and is carried through a large manifold with easy curves to make certain a full and uniform supply. The carburetor is fitted with an auxiliary air valve and is said to give very satisfactory results under all operating conditions.

The ignition is by a type RD Remy magneto, that is driven by an extension of the water pump shaft, to which it is coupled, through a single set of spark plugs located over the exhaust valves. This is supplemented by a battery of four dry cells for use when starting. Where a timer is desired a shaft is supplied and it is installed vertically at the front end of the motor and driven by gears.

The driving system is coupled to the flywheel of the motor by a cup-shaped member bolted to

Right or Magneto Side of the Rutenber Motor.

the wheel, in the rear end of which the forward end of the driving shaft is fitted, the connection being telescopic. The shaft is designed to com-



Digitized by Google

pensate any stresses that may result from chassis distortion. The shaft is extended through a large bearing mounted in a chassis cross member, and back of this bearing is a thrust bearing composed of two steel plates 7.5 inches diameter, between which is a bronze plate that serves as a retainer and carries 85 steel balls .5-inch in diameter. This eliminates any thrust upon the engine shaft. To compensate for the forward thrust of the shaft another smaller bearing is fitted. The rear end of the driving shaft carries a large aluminum disc, the rear face of which is milled smooth and the other is webbed to afford strength. This shaft and the disc may be moved forward or backward slightly to engage or give clearance.

Mounted in the chassis frame, in gimbals which will permit any movement of the shaft without side leverage and on heavy bearings, is the jackshaft. This shaft carries a wide sprocket at the right side, and a wheel that may be moved along the shaft in either direction from a point sufficiently worn. The coefficient is extremely high and the materials wear very slowly, not being susceptible to the influence of water, oil or dust. Being carried in the gimbals the jackshaft is always in correct relation with the driving disc.

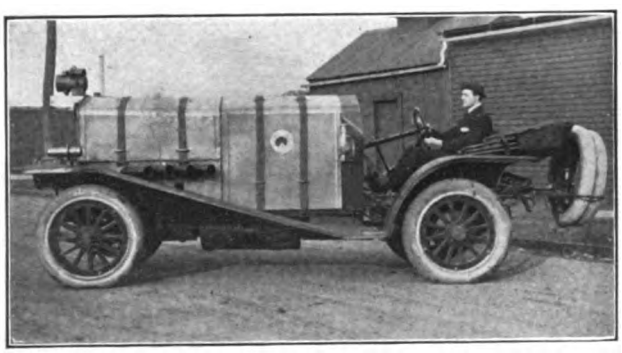
The power is transmitted from the jackshaft by a Renold silent chain to a sprocket incorporated with the differential gear in the rear axle. The sprockets and the chain are in an aluminum case and are thoroughly lubricated, operating noiselessly and with minimum wear. The chain is about three inches wide and it has strength to carry many tons. It is retained on the sprockets by collars. A handhole in the chain case permits lubrication and examination of the chain.

The chassis frame is a pressed steel channel of .1875-inch stock four inches wide and 1.25 inches depth. There are four cross members, braced by large gussets. The radiator is carried on the front cross member and the jackshaft hung in cast steel brackets, further strengthens

The Lambert Patented Friction Drive System. **The 7.5-Inch Ball and Plate Thrust Bearing.** **The Lambert Pedals and Automatic Release Device.**

just beyond the right of the centre to the left side, corresponding to about two-thirds of the width of the disc on the driving shaft. The periphery of the wheel carries a ring of fibre that may be easily removed or replaced, and by a movement of a pedal the driving disc may be brought in contact with the rim of the driven wheel, a spring affording sufficient pressure so long as contact is desired. From any point at the left of the centre of the driving disc to the extreme edge, where the disc and wheel contact, the movement of the wheel is in ratio to its position. That is, at the centre it is very slow and at the edge it is at the full velocity and when the driven wheel is at the right side of the driven disc the movement is in reverse. The variations of speed may be anything desired from minimum to maximum, and either forward or reverse. The face of the driving disc is a plate of aluminum alloy and this and the fibre ring may be renewed whenever the frame. The springs are the Titanic brand, are semi-elliptic forward, 40 inches length and 1.75 inches width, with six leaves, and the rear springs are full elliptic, 38 inches length, of the same width and number of leaves.

The rear axle is a semi-floating type carried in a housing of pressed steel, with shafts 1.25 inches diameter. The spring seats and brake flanges are integral. The differential and shaft bearings are the Hyatt make. The front axle is an I section, drop forged steel, 3.125 inches depth and two inches width, with Elliot type yokes. The wheel spindles are nickel steel, and the wheels are mounted on Standard ball bearings. The axle pivots are carried in bronze bushings. The tail lever is a drop forging, the drag link is cold rolled steel and the tiebar a steel tube located behind the axle.



The drive is at the right through a steering column of the double nut type set at an angle of

Digitized by Google

45 degrees. The wheel is 18 inches diameter with aluminum spider and mahogany rim. The steering gear is adjustable for wear and is lubricated by grease cups. The throttle and ignition levers are mounted on a quadrant above the wheel. The control is by a clutch pedal at the left and a service brake pedal at the right with an accelerator between them. The change speed ever and the emergency brake lever are at the right side of the car. The service brake is external contracting and the emergency brake internal expanding, the brake drums being 12 inches diameter and 2.5 inches face. The brake shoes are faced with Raybestos.

The wheels are artillery type, of second growth hickory, 34 inches diameter, fitted with demountable rims and 34 by 3.5-inch quick detachable tires. The wheelbase is 117 inches and the tread 56 inches.

The body is a straight line type seating five, of metal with a wooden frame, fitted with front

Interesting Machine Designed and Constructed by G. P. Blackiston, Canton, O.

doors. The dash is mahogany. The upholstery is a fine quality of leather and curled hair, made with luxurious springs. The hardware is nickel finished. The gasoline tank is beneath the front seat and has a capacity of 12 gallons. The touring car is finished a very dark blue and the roadster is gray and black. The design is very pleasing, the mudguards being graceful, the hood sightly and the running boards are ample. The tool boxes are of special design and are located at the front of the rear seat. The head lamps are designed for gas and the dash and tail lamps for oil, unless special equipment is ordered.

HAS HIGH SPEED POSSIBILITIES.

A correspondent in Canton, O., submits the photograph reproduced herewith and the description of a car designed and constructed by G. P. Blackiston of that city, which is expected to have a speed possibility of 137 miles an hour. It is understood that the owner will not use it for racing purposes, but expects to find enjoyment in making long distance tours therein.

The chassis formerly was a part of a powerful racing machine. The hood is five feet eight inches in height, from the ground, and is seven feet six inches long, enclosing a specially designed 90 horsepower motor. The steering post is so long, due to the unusual length of the hood, that a universal knuckle is required, and it is so heavy that two men hardly can lift it from the ground. Two different radiators are used, one being of the honeycomb type and the other tubular.

One of the particularly novel features is the mirror system, by means of which the driver is enabled to secure a clear view both ahead and behind. As the hood towers above the driver's head, the only direct view to the front is at one side of the car, but the ingenious placing of mirrors is expected to overcome this difficulty. An electric searchlight will be installed on top of the forward radiator.

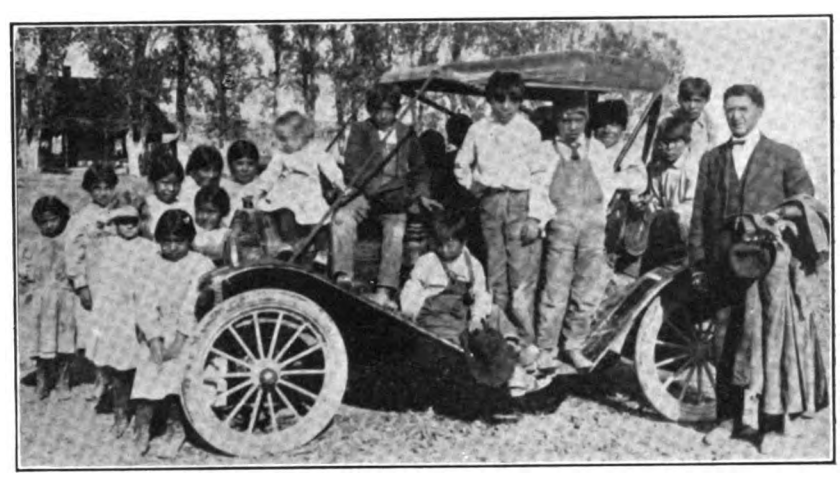
THE MODERN SALES FORCE.

An idea which will bear passing along to other concerns in the industry comes from the Weinstock-Nichols Company, San Francisco, Cal., manufacturers' agent and distributor for several well known brands of automobile accessories on the Pacific Coast. It takes the form of a bulletin which was issued recently to the sales force, and it has the title of "The Bar-Room Salesman."

Briefly, the circular sets forth that "Customers can no longer be bribed with champagne and cigars and a good time into buying anything connected with the auto trade." It holds that the customer of today demands two things—good service and good value—and that he has a right to expect of the salesman: That he shall know his business from start to finish, that he shall be able to give intelligent information, that his statements shall be truthful and dependable, that his promises shall be faithfully kept, and that he shall treat the customer as a gentleman would treat him.

"It's a good thing for the customer, the salesman and the trade that the day of the bar-room salesman in the auto accessory trade is a thing of the past," is the final summing up of the document. "Goods must now be sold on their merit and the salesman who hopes to succeed must substitute real knowledge for bluff and good fellowship."

Digitized by Google



DETROIT DEALERS SECURE SPACE.

The drawing of exhibition space for the annual show of the Detroit Automobile Dealers' Association in Wayne Gardens, Detroit, was scheduled for Nov. 25. The display will be made Jan. 27-Feb. 1, under the management of Walter Wilmot, whose office is at 501 Bowles building. The present allotment is for those who made application previous to Nov. 20, and later applicants will be forced to accept such provision as the committee is able to make.

METZ FOR INDIAN SCHOOL.

That the products of New England manufacturers enjoy a wide sale and are used in all sections of the world has long been conceded, but there is a certain pleasure in coming upon goods produced at or near home when one is a long distance from the native town. Recently a resident of Boston, who was visiting on the Pacific Coast, had occasion to call at the Fort McDermitt Indian school, National, Nev., and was somewhat surprised to find a Metz runabout, made by the Metz Company, Waltham, Mass., awaiting him at the railroad station.

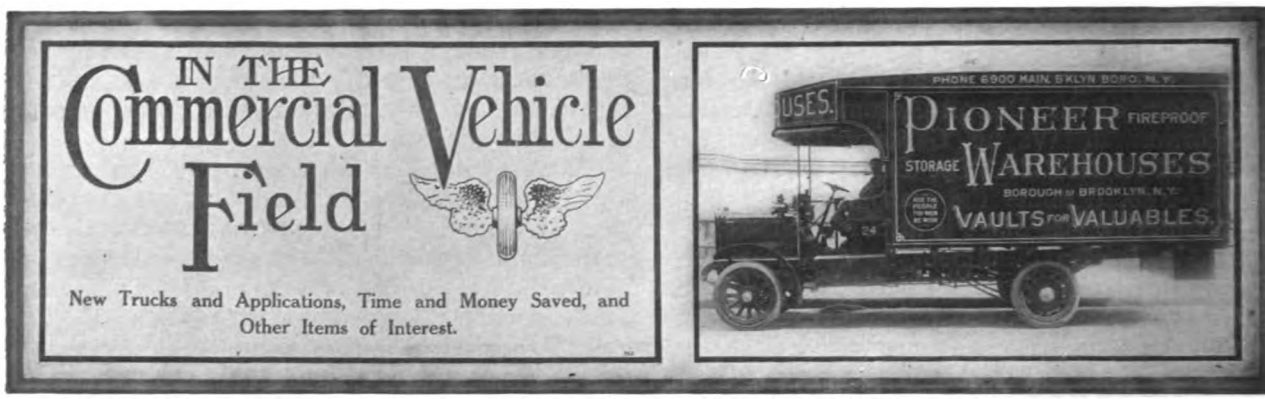
The machine is owned by Dr. W. F. Boyton, and the children at the school find plenty of enjoyment in taking short trips with him. The Boston visitor secured some very good picture post cards of the Metz with the children crowding in and about it, one of which is reproduced herewith.

Metz Car Owned and Operated by Dr. W. F. Boyton at the Fort McDermitt Indian School in National, Nev.

There are so few motor cars in Nevada that it is worthy of special note that the Metz is one of them. Dr. Boyton assured his visitor that it had given splendid service. Fort McDermitt is on the extreme northern boundary, next to the Oregon line, where the roads are by no means of the best.

NEW WAVERLEY YEAR BOOK.

For some time the Waverley Company, Indianapolis, Ind., maker of Waverley electric machines, has occupied a foremost position in the industry with its annual year book. The issue for 1913 carries the innovation one step further removed from the formal catalogue by adding a calendar for each month, the object being to direct the reader's attention the more forcibly to the advantages of a car whose usefulness is circumscribed by no limitations of climate, season or weather conditions.



Carrying out this idea colored illustrations present Waverley cars in use at all seasons of the year, and the page assigned to each month presents hints that will aid the owner in enjoying nature in its varying moods and forms of life. That portion devoted to description of the models themselves is most complete in every detail, the text being supplemented with numerous illustrations of the parts to which attention is called.

As an example of the printer's art the book is in full keeping with the exemplification of the manufacturer's art represented in the various models of the Waverley electric pleasure car. No suggestion that can be of value to the prospective purchaser has been omitted.

LARGE ORDER FOR FREIGHT CARS.

An order recently placed by the Pennsylvania railroad will be of interest to automobile dealers and owners. It calls for 4500 cars and was placed with the Pressed Steel Car Company of Pittsburg, Penn. One thousand cars are to be for the express purpose of hauling automobiles. This is supposed to be the result of the automobile manufacturers' complaints of a shortage in cars fit for this purpose and a threat on the part of some of them to drive the machines to their destinations rather than to wait for weeks for an opportunity to ship them. It is anticipated that the cars will be ready for service soon.

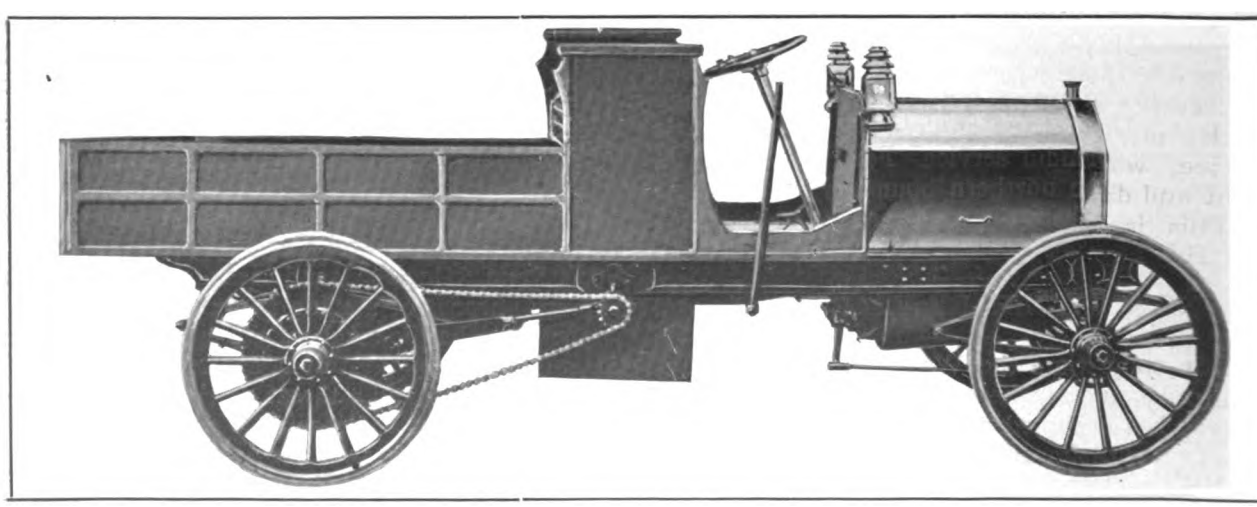
KEARNS LIGHT DELIVERY WAGON.

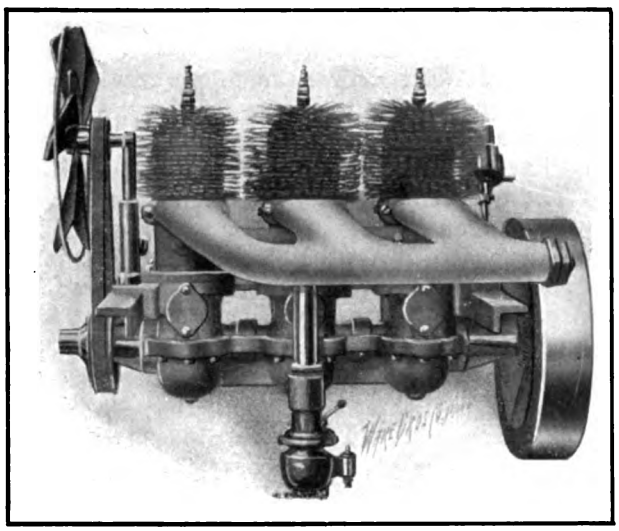
The Kearns Motor Car Company, Beavertown, Penn., has adopted a new selling plan, under which branch houses, each bearing the company's name and being under its direct supervision and control, are to be established in all sections of the country. The car itself presents a number of distinctive features, which will prove of interest.



The 1913 line will comprise but one chassis, this being of the light delivery type with carrying capacity of 1500 pounds, fitted with the style of body which will best meet the requirements of the individual purchaser. The motor is a three-cylinder, two-cycle, air-cooled unit, rated at 20 horsepower. The company claims to be a pioneer in the production of gearless-clutchless-valveless cars, having built nothing but machines of this type for seven years.

Among the new features added this year is the Shur Go self-starter. Other fittings include the well known Schebler carburetor, the Atwater Kent ignition system or the Eisemann high-tension self-contained magneto with fixed spark, .625-inch roller chains, two-inch Dragon steel full elliptic springs, large roller bearings in the transmission, belled crankshaft and two-piece crankcase of aluminum. The tires are of the Swinehart make and are of ample size.

PEERLESS DELIVERS MILK.



Owing to its ability to carry heavy loads over steep grades in much less time than horses, the five-ton Peerless truck, made by the Peerless Motor Car Company, Cleveland, O., and operated by the Howell Condensed Milk & Cream Company of Jersey City, N. J., is saving its owners over $3000 a year in ferry tolls alone, in addition to all the usual savings that result from successful motor truck operation. The company hauls every night a large quantity of milk from Jersey City to a point two miles in the interior of Staten Island. The truck makes two trips with 100 40-quart cans, each weighing 110 pounds.

The present route covers a run of eight miles from the distributing station in Jersey City to

Side View of the Kearns 1500-Pound Delivery Wagon, Which Possesses Several Features of Interest.

Digitized by Google

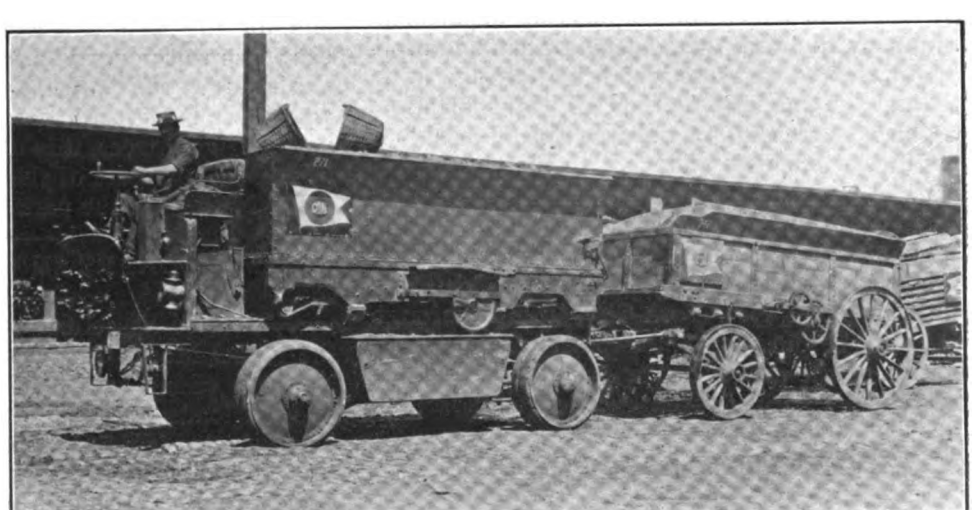
Intake Side of the Kearns Air-Cooled Power Plant.

the Bergen Point ferry and a run of two miles after reaching Staten Island, making a round trip of 20 miles, or 40 miles for the night's work. The ferry tolls are 35 cents for each passage, or $1.40 a night. It was impossible for the teams which formerly did the work to take this route because they could not cover the 10 miles over steep grades fast enough to deliver the milk on time.

Two teams formerly left the distributing station and proceeded by way of the Erie railroad ferry to New York. The toll for this trip was $1 a team. Across Manhattan it was one mile to South Ferry and the ferry toll from South Ferry to Staten Island was $1.50 for each team. This amounted to $10 a night for two round trips for two teams as against $1.40 for the truck. As the motor vehicle works every night in the year the annual saving is $3139. The Howell company has recently put the truck into double service, working it night and day.

This is not the first time that Peerless trucks have demonstrated their value in work of this nature, and wherever they have been employed they have indicated remarkable economy.

COUPLE-GEARS AS COAL WAGONS.



A large number of electric vehicles are employed by the coal dealers in and about Boston. One of the first machines to be placed in service in this district was a Couple-Gear, made by the Couple-Gear Freight-Wheel Company, Grand Rapids, Mich. This was installed by the J. N. Cousens Coal Company in Brookline.

The concern has a large business, and its customers frequently require large quantities of coal, these including residences, apartment houses and manufacturing plants. The idea was to secure an equipment which should permit of the use of trailers as occasion demanded, and an accompanying illustration shows one of the Cousens vehicles hauling a loaded wagon behind the truck itself.

It is maintained that the construction of the Couple-Gear wheels, in which the motors are so located as to permit of driving all four road members, particularly adapts these vehicles to such use. Certainly the experience of the Cousens company has been such as to warrant this assumption. Several additional trucks of the same make have been added during the past three years, and among the latest vehicles is a special design which utilizes Couple-Gear wheels in front and the regulation steel tired members in the rear.

LONG HAUL FOR UNIVERSAL.

Manager F. E. Grable of the Universal Truck Company, Boston, distributor for Universal trucks, made by the Universal Motor Truck Com-

pany, Detroit, recently gave a demonstration of the utility of the vehicle to a furniture dealer in Waltham. The truck left the Boston garage at 4:20 in the morning, reached Waltham at 5:25, and left at 10 with a three-ton load of furniture, including a piano, for South Berwick, Me. It arrived there at 8 in the evening, left at 11 and reached Waltham at 8:25 the following morning. The distance travelled was 201 miles and 33.5 gallons of gasoline and five quarts of oil were used. The machine averaged 10.5 miles an hour and completed a very satisfactory trip.

ATLANTIC IN PAPER HAULAGE.

The policy adopted by the Atlantic Vehicle Company, Newark, N. J., maker of Atlantic elec-

First Electric Truck in Wholesale Paper Haulage—A 3.5-Ton Atlantic.

tric trucks, in which the engineering department volunteers to aid in the solution of haulage problems presented by those who are interested in installing the modern method of transportation, has been successful in opening up at least one new line of business endeavor to the electric vehicle. An accompanying illustration shows what is believed to be the first electric truck utilized in the wholesale paper business. The machine was purchased by the Maurice O'Meara Company, 448 Pearl street, New York City, after a thorough study of the question and a most careful investigation of the merits of the Atlantic. It is a 3.5-ton vehicle and has given excellent satisfaction.

GOVERNMENT ASKS FOR BIDS.

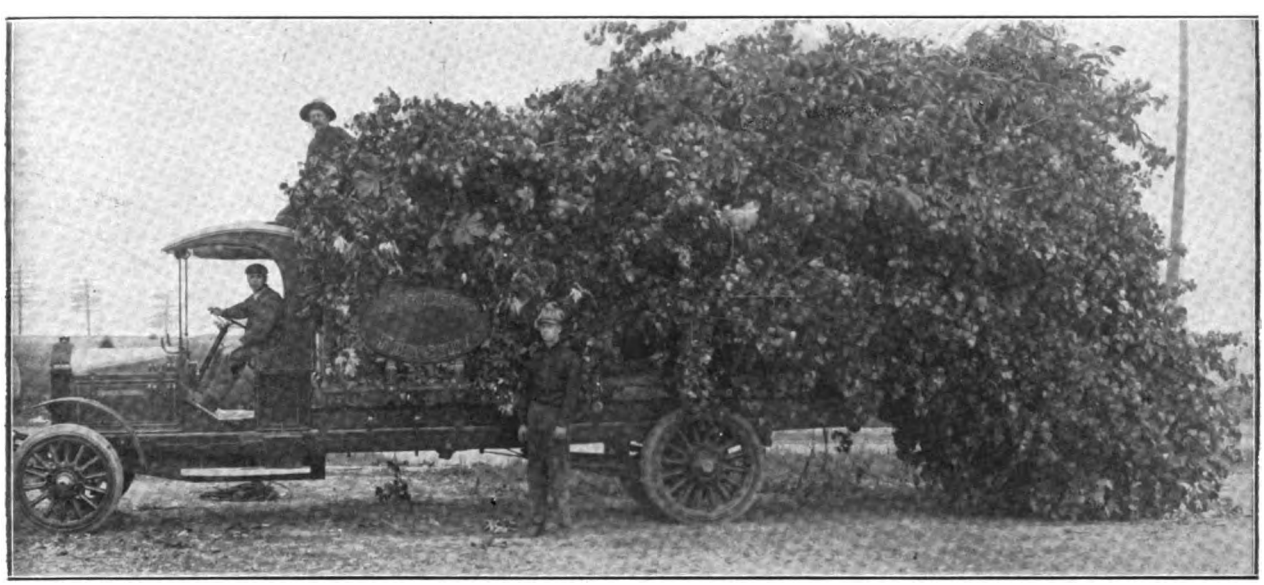
Bids are being asked, through the office of the secretary of the treasury, by the general supply committee of the government department, from the manufacturers of motor trucks, both gasoline and electric, for the supply of motor vehicles to be used during the fiscal year. Complete specifications are given in the blank bids that have been prepared.

These specifications have been standardized by the bureau of standards, the purpose being to have trucks of a distinct type in government service in the future. The regulations call for bids on trucks ranging from 1000 pounds to 3000 pounds capacity. The small machines are intended for mail wagons, but the government has not yet decided whether it will buy large or small trucks. The object of asking for bids on different types of cars is to obtain comparative information as to prices, etc. Manufacturers are told that for the present probably not over half a dozen machines will be bought, but that this number will be increased in the future.

PIERCE-ARROW FORESTRY WAGON.

There are several problems in connection with the transplanting of trees, such as is undertaken by the forestry departments of various cities throughout the country, and none the least of these is the method to be employed in transporting the tree with its roots, branches and leaves, from one point to another. The park department of Buffalo, N. Y., has solved this by the utilization of the five-ton, worm driven Pierce-Arrow truck made by the Pierce-Arrow Motor Car Company of that city, and shown in an accompanying illustration.

It will be noted that the load this vehicle is called upon to handle is bulky rather than heavy, and for this reason a chassis with long wheelbase was selected. The body is of the platform and stake type, 16 feet six inches wide and the wheelbase is 17 feet. When not in use for transporting living trees, it is utilized in carrying supplies from one part of the city to another in the ordinary work of the park department.



KISSELKARS IN THE SIERRAS.

A fleet of KisselKar motor trucks, made by the Kissel Motor Car Company, Hartford, Wis., has been racing against time in the Sierras with five-ton loads over the worst roads imaginable. The vehicles left San Jose, Aug. 17, under contract to haul cement and building materials from Keddy to Big Meadows on the Feather river, where the largest dam in the western hemisphere is in course of construction. The original con-

Digitized by Google

tractor had overestimated his capacity and with winter coming on and the work in no condition to be abandoned to the severe weather of the northern Sierras, the San Jose truck firm was called upon to haul the necessary material to complete the work.

The machines ran day and night over the 25-mile route, carrying five-ton loads in both directions. Two men were assigned to each truck to provide relief for the constant duty. In September if the machines stopped the radiators had to be drained to prevent them from freezing and the roads were so rough that tires had to be replaced every 1000 miles, the usual life being from 8000 to 10,000 miles. A week before the snow storms ended activities the trucks were turned toward San Jose and by using logging chains on the rear wheels the heavy grades were negotiated, although at one or two points it was thought the vehicles would have to be abandoned for the winter and sheds built over them.

Five-Ton Worm Driven Pierce-Arrow in Service with the Forestry Division of the Buffalo Park Department.

OPPORTUNITY WITH PARCELS POST.

With the announcement of the establishment of a domestic parcels post in connection with the postoffice department has come much speculation as to the possible effect this will have upon the automobile industry, and particularly with reference to the commercial vehicle field. In order to understand the situation it will prove of interest to consider briefly some of the demands already made upon the federal government in the collection and delivery of mail.

During 1911 there was expended for the delivery of mail by city carriers the sum of $33,165,067.58, and for rural free delivery, $37,145,756.65. In the latter service 41.559 carriers were employed on 41,656 different routes, with an aggregate mileage of 1,007,772. In 1907, 14,643,129,000 pieces of mail matter were delivered by the United States postoffice department. There does not appear to have been an official counting since that date, but 2,727,295,076 pieces were handled by the rural carriers alone during 1911, and it would appear from this that the business transacted by the department must have increased materially in the past five years. The postoffice system cost the government $237,648,926.68 last year.

Under the terms of the act of Congress, approved Aug. 24, 1912, the postmaster-general is authorized to establish a domestic parcels post, embodying a zone system, Jan. 1, 1913. The description of fourth class mail matter is extended to include all other matter, including farm and factory products, not now embraced by the law in either the first, second or third class, not exceeding 11 pounds in weight, nor greater in size than 72 inches in length and girth combined, nor in form or kind likely to injure the person of any postal employee or damage the mail equipment or other mail matter and not of a character perishable within a period reasonably required for transportation and delivery.

The zones are eight in number, not including rural route and city delivery within the immediate jurisdiction of the postoffice in question.

Digitized by Google

These are, respectively: All area within a radius of 50 miles, over 50 and less than 150, 150-300, 300-600, 600-1000, 1000-1400, 1400-1800, and over 1800. The fees are set forth in the following table:

	First pound	Each add. pound	Eleven pounds
Rural and city	.05	.01	.15
50 miles	.05	.03	.35
50-150 miles	.06	.04	.46
150-300 miles	.07	.05	.57
300-600 miles	.08	.06	.68
600-1000 miles	.09	.07	.79
1000-1400 miles	.10	.09	1.00
1400-1800 miles	.11	.10	1.11
Over 1800 miles	.12	.12	1.32

Special stamps are to be provided for this new mail service, and special sacks as well. Maps, with the zones carefully marked thereon, are to be prepared for the several postoffices of the country. The accompanying table sets forth what is expected in the way of delivery. The total appropriation thus far made is $750,000, and the postmaster-general must do all this work with this money. Another appropriation of $25,000 has been made for a further inquiry into the matter by a committee of six persons, members of Congress, three of whom are to be appointed by the president of the Senate and three by the speaker of the House of Representatives.

Thus far, no definite information has been vouchsafed concerning the collection of this new mail matter. It is not known whether the sender will be required to deliver his parcel to the postoffice, as he must do now in the case of the international parcels post. Apparently, there is no doubt that the government contemplates the delivery of all parcels reaching the respective postoffices, at least to those persons who are served by city and rural carriers.

It will be seen that the new parcels post resembles the older express service, which it is expected to supersede in a measure. Express companies have been studying the transportation problem for some time, and have been adding motor trucks very rapidly of late. It is assumed, therefore, that the government will find it practical to utilize mechanical transports in this new service. The possibilities are many.

In view of the fact that a special committee has been created to study the matter further, it would seem that definite plans concerning the delivery of parcels must await this committe's report. It seems probable, however, that if the parcels post is to afford its greatest service, provision must be made for both collecting and delivering packages.

Let it be assumed for instance, that a merchant in a small town or city receives an order over the telephone from a suburban or rural customer. It may be that the goods ordered are not of sufficient value to warrant operating his own delivery system to serve this customer. Under the parcels post regime, he may call upon the United States government to maintain his delivery system for him. This is but one of the many illustrations which might be cited, and it is obvious that the present methods of delivery will soon be inadequate to meet this added burden. The time must surely come when motor trucks, or at least light delivery wagons, must be utilized in this field.

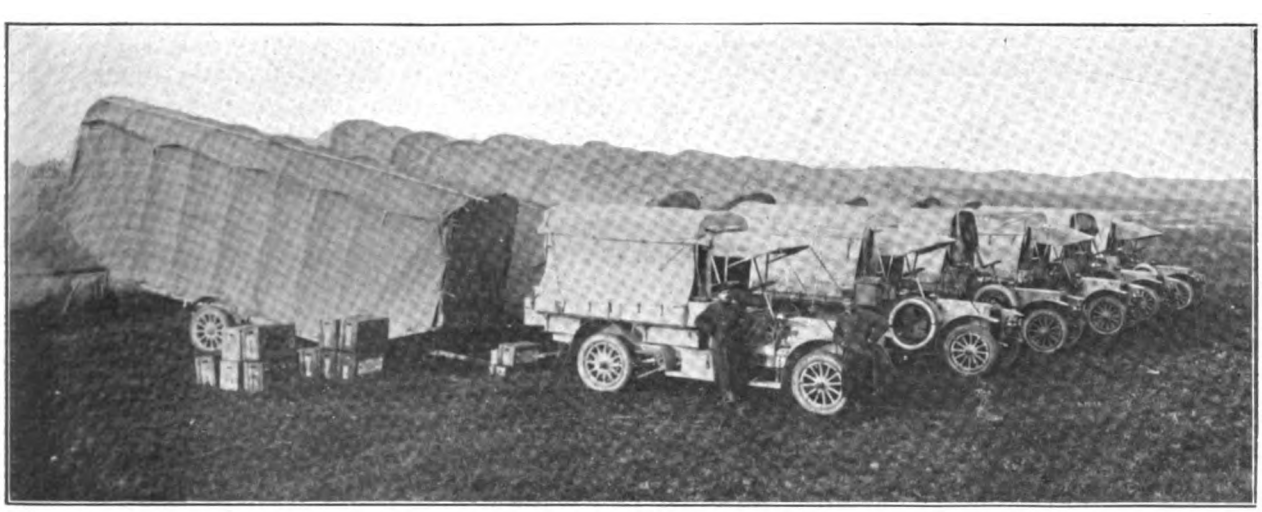
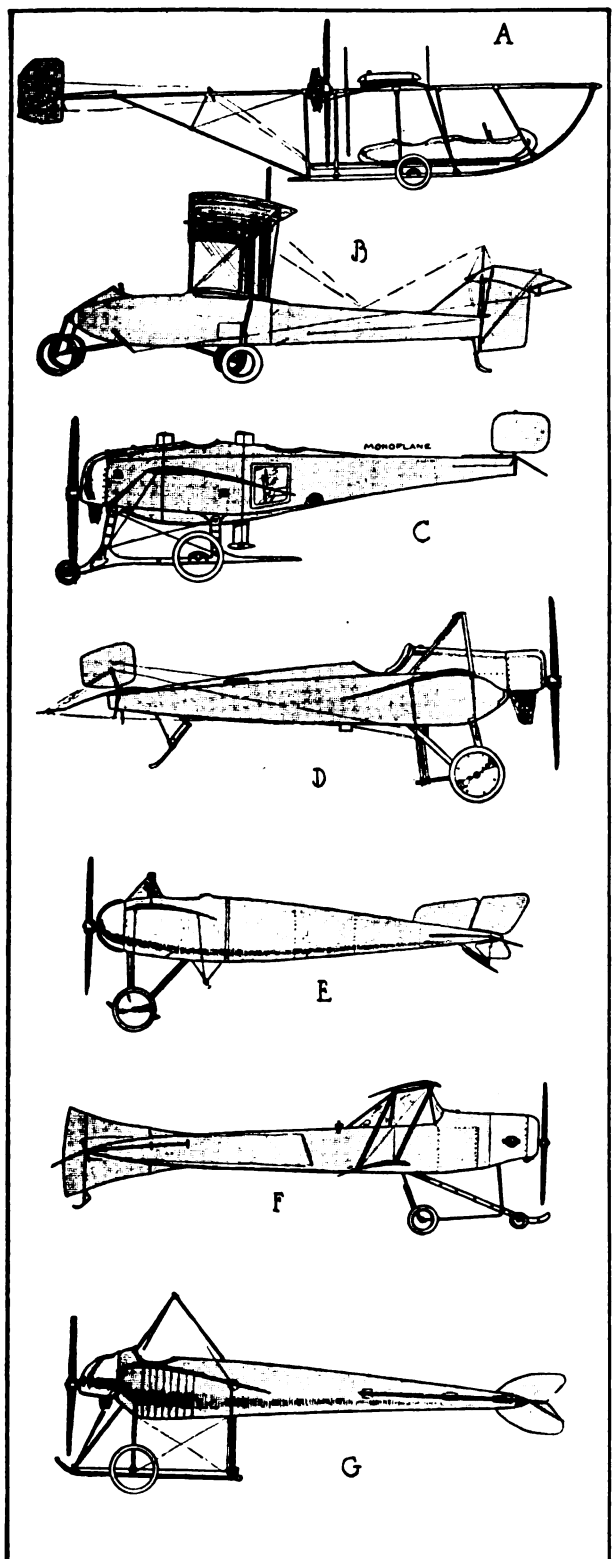
In The Aviation Field



With the Manufacturer and Operator in America and Abroad

Perhaps the most notable feature of the Paris Aerial Salon this year was the decided support given by the French government. Out of a total of 77 machines on view, as compared with 43 in 1911, 27 belonged to the French army. Besides the aeroplanes displayed by the government, a fleet of motor trucks connected with the aerial armada also was shown, making a decidedly comprehensive military exhibit.

Another marked feature was the absence of dirigible balloons. Last year a complete Astra dirigible was suspended from the ceiling and two or three nacelles were on display. This year the only reminders of the lighter-than-air craft were two spherical balloons and two dirigible models. Several "aviettes," as the man propelled flying machines are termed by the French, were to be seen, however.



Last year there was but one hydraeroplane, this being a Voisin canard, which was absent this year. There were 11 of these machines on display, seven being of the biplane type and four of the monoplane. For the most part, the newer craft had the appearance of being little else than an ordinary creation to which floats had been fitted. This cannot be said of the exhibits of the Caudron Freres and Henri Farman. The Borel also has developed a new idea by utilizing a rudder on the rear float, by means of which it is possible to steer the craft in the water at low speeds. The forward floats are supplied with oarlocks, in order that pilot and passenger may clamber down from their seats and row up to the landing slip.

Sketches of some of the machines shown are presented herewith, and it is hardly necessary to call specific attention to the changes presented. In many instances these take the form of refinements only. There seems to be a growing tendency toward the enclosed types, although this is carried to an extreme in but a few designs. Some constructors have fitted devices intended

Fleet of Motor Trucks Attached to the French Army's Aeroplane Armada, Which Attracted Unusual Attention at Recent Paris Aerial Salon.

New Machines at Paris Salon: A, Tubavion Monoplane; B, Sanchez-Besa Biplane; C, Bristol Monoplane; D, Caudron Monoplane; E, Borel Monoplane; F, Zodiac Biplane; G, Blerlot Monoplane.

to make it possible for the pilot to start the machine from the seat. As a whole, while the Salon indicates undoubted progress, there was not the same presentation of innovations which has marked previous displays. Perhaps this was due in a measure to the fact that few strictly new designs were held back for announcement at this time.

What is characterized by Glenn H. Curtiss as one of the most important inventions in the field of aviation, was given a successful test at the Washington navy yard, Nov. 13. The device is termed a catapult for launching aeroplanes from the deck of a warship, and Capt. Washington I. Chambers of the naval aerial corps is responsible for its production.

It includes a slide 30 feet long and three feet wide. In the test this was fitted to a raft. A Curtiss hydraeroplane, driven by Lieut. T. D. Ellyson, was placed on a little car on the slide. By means of a tackle arrangement, worked by compressed air, the hydraeroplane was hurled into the air. The machine rose instantly without touching the water, and the little car dropped off the end of the slide.

The device is constructed in sections and is intended to be packed in small compass and carried in any convenient spot of the ship. It can be set up easily on the turret, and the only necessary equipment is a sufficient supply of compressed air. It is anticipated that the hydraeroplane will alight on the water upon its return, and be hauled on board as at present.

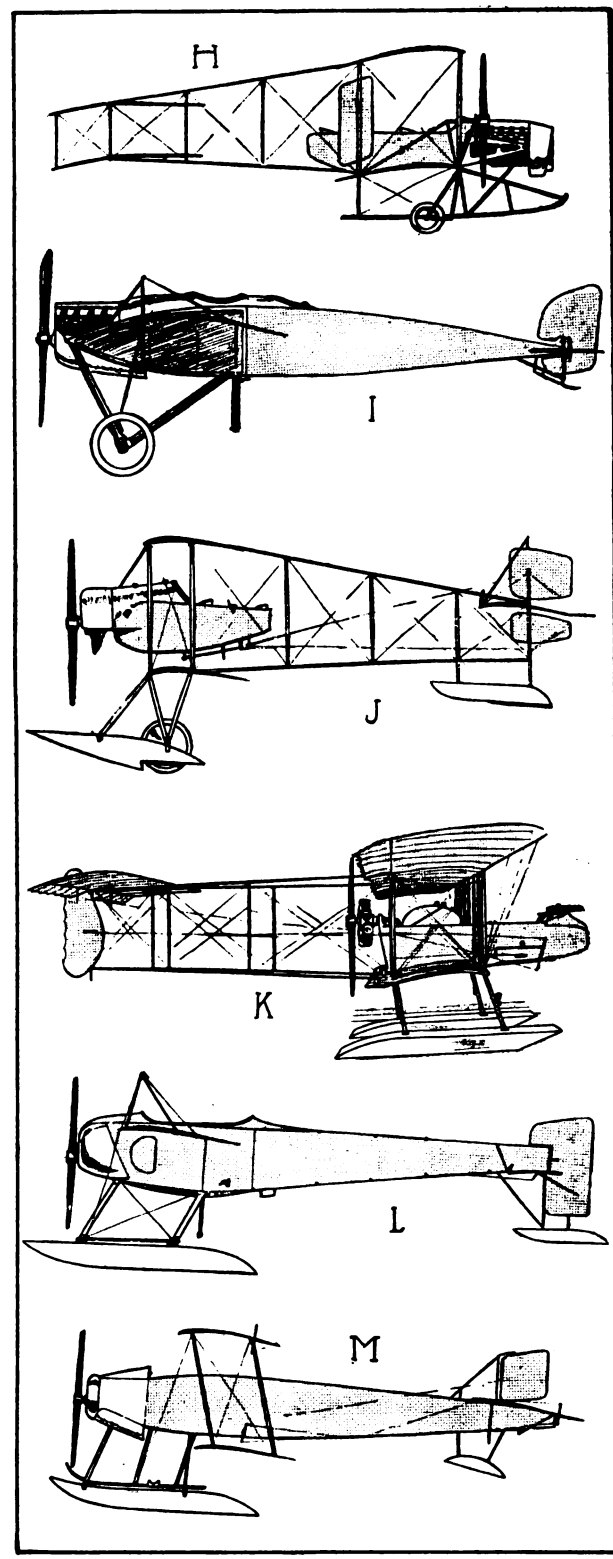
Flying a Wright biplane, Harry B. Brown carried a woman passenger to an altitude of 5000 feet at Oakwood Heights, Staten Island, N. Y., early in the month, thus establishing a new American altitude record. The previous mark of 3347 feet was set by Claude Graham-White with a male passenger at Chicago, Sept. 30, 1911.

A. A. Shillcut of Little Rock, Ark., has invented a biplane which he declares will be absolutely fool proof. The patent office claims set up the following: A box like upper plane with parachute attachment, double propellers, sectional biplane at right angles to upper plane, device to divert air currents from front propeller, and a rudder. Two parachutes are utilized, one at either end of the upper plane, and it is maintained that these will act automatically and in such manner as to bring the machine to earth with safety. Dr. J. W. Barnett is interested financially in the project and it is expected that the

Digitized by Google

completed aeroplane will be ready for its initial tests next month.

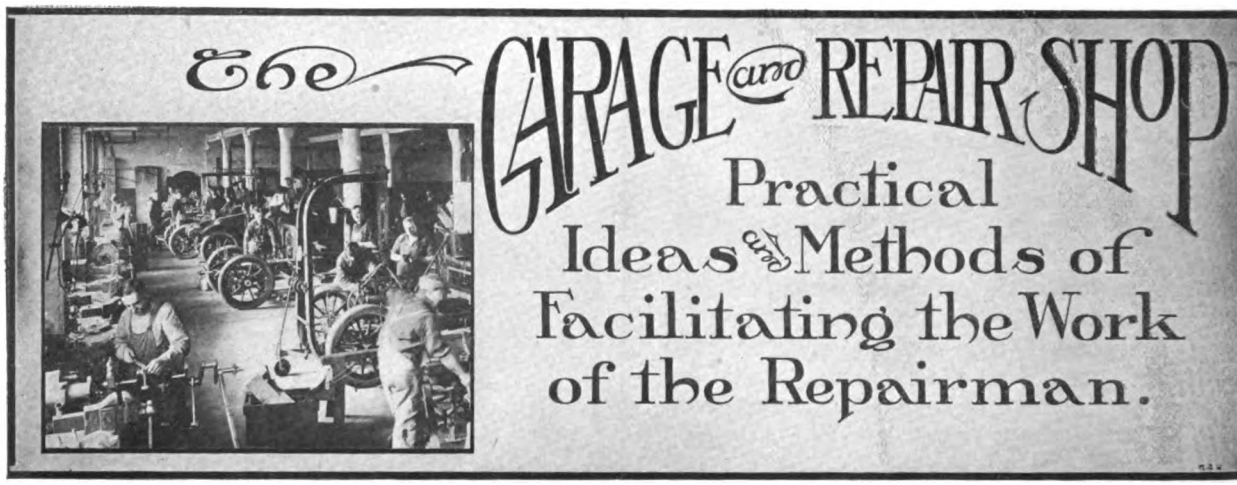
Ruth Bancroft Law, who has been flying a Burgess-Wright biplane in several sections of New England during the past few months, successfully passed her tests for a pilot's license at Oakwood Heights, Staten Island, N. Y., Nov. 13.



Anthony Janus, in a Benoit hydraeroplane, easily defeated an automobile driven by Charles Young in the early stages of the race between Omaha, Neb., and New Orleans, La., which began Nov. 12. The motor car was forced to abandon the task two days later.

Lieut. T. D. Milling, in a Burgess-Wright biplane, was successful in directing the range of a supposed enemy to the firing squad from Fort Riley, Junction City, Kan., Nov. 14. The officer acted as observer and dropped cards to the ground informing the soldiers where to direct their fire and the results obtained from each shot. Following this test several officers were detailed to make a 40-mile cross country flight.

Nels J. Nelson of New Britain, Conn., who attracted considerable attention during the early part of the year by flying an aeroplane of his own design in several sections of the country, has invented an hydraeroplane. He claims to have developed a new type of pontoon, which will enable the machine to return to the water without casting up spray and to be manoeuvred in the water with less difficulty than others now being flown.



The Aero Club of Pennsylvania has prepared a bill for introduction into Congress, asking that aviation be placed under federal control. It will provide that aviators must secure federal licenses before being permitted to operate machines, and it is anticipated that the new plan will eliminate some of the dangers now prevalent.

From Paris comes the information that a Catholic priest in North Africa recently carried the Eucharist on a monoplane in order to administer the last rites to a dying soldier on the edge of the Sahara. Commandant Largest was fatally wounded in a skirmish between the Spahis and Touaregs, and a brother officer realizing his plight flew to the nearest town where he picked up the priest and returned in time. This is believed to be the first instance in which an aeroplane has been utilized on such a mission.

Additional Machines at Paris Salon: H, Savary Biplane; I, Morane Monoplane; J, Caudron Hydraeroplane; K, Henri Farman Hydraeroplane; L, Borel Hydraeroplane; M, Goupy Hydraeroplane.

LIGHTING THE WASHSTAND.

The lighting facilities of some garages are very poor insofar as the washstand is concerned and when the latter is installed after the building has been wired for electricity, the washer experiences difficulty in securing sufficient illumination. While lamps of the overhead type are generally satisfactory they do not light up the wheels and sides of the machine and frequently the discriminating owner is heard to complain that his automobile was only half washed.

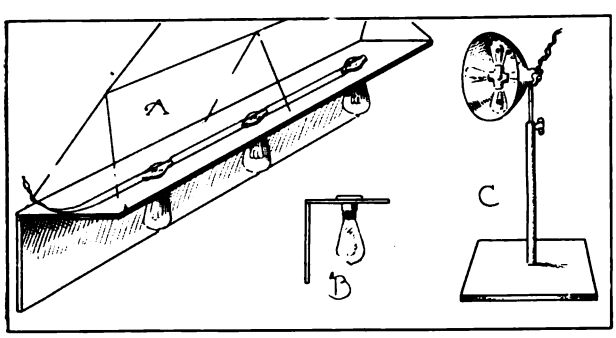

Fig. 1—Inexpensive and Easily Constructed Lighting Panel for the Washstand: A, Showing Method of Suspension; B, End View of Panel; C, Adjustable Stand Constructed from Music Rack.

A proprietor of a garage who installed a washstand on the main floor contrived the lighting board shown at Fig. 1 A. As a result his washer is provided with ample light and has no opportunity to make excuses if complaints are received relative to his work.

The panel was constructed easily, the material being two smooth boards about five feet long, six or seven inches wide and .625 inch thick, although these dimensions may be altered to suit convenience of stock and location. The boards were joined as indicated at B. Lamp sockets were attached and wired and the interior of the panel was coated with white enamel paint, which formed a good reflector.

Two of these panels were made, one for either side of the machine, and they were fitted with suitable rope and pulleys so that they could be raised to the ceiling when not being utilized and lowered when washing was to be done. As the members were adjustable to any desired height the running gear was as well lighted as the body, enabling the workman to perform his work satisfactorily.

At C is presented a suggestion for a lighting stand. It comprises on old music rack, having an adjustable rod to which is secured a reflector which could be of such size as to permit of the use of a group of four lamps. The rack could be mounted upon a wooden base and with a sufficient length of flexible cord and connecting plug, the device could be moved to any desired position. The design is similar to the side lights utilized upon the stage. Such an arrangement should prove of value in the repair shop where considerable overhauling is done at night.

AN EXTRACTOR TOOL.

An extractor tool, the principle of which is of interest, in that the manner of exerting energy is by a difference in the pitch of the threads of two bolts, is illustrated at Fig. 2, the design being contributed by a mechanic to Motor Traction, a foreign publication. The workman utilized the tool for removing a brake drum which had been driven into position and which resisted the application of ordinary tools.

The tool consists of a plate of mild steel, .75 by two inches, and is tapped out to take a .75-inch bolt about two inches long. The bolt is

Digitized by Google

drilled out and tapped to take a .4375-inch bolt, four inches long. Two holes are drilled in the plate, near its ends, and two pieces of .5-inch

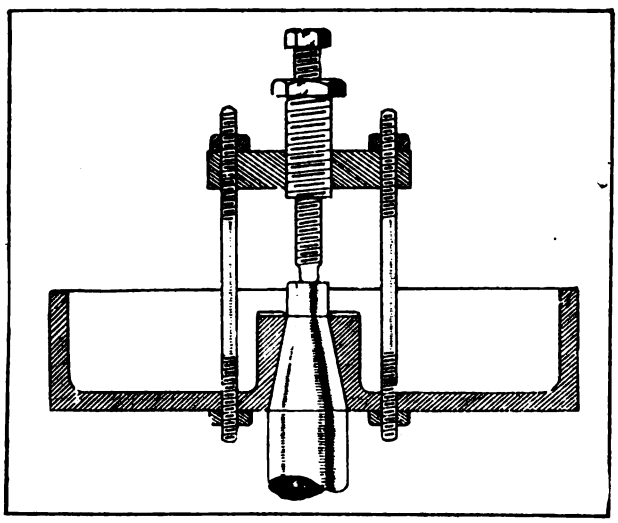

Fig. 2—An Extractor Tool Employing Two Different Pitches of Threads to Exert Leverage.

mild stud steel, four nuts and a few washers complete the device.

The sketch shows its application, the .4375-inch centre bolt touching the shaft. This is held with a wrench to prevent turning while the smaller member is actuated by another wrench. The difference in the pitch of the two bolts is held responsible for the force exerted.

A CHUCK BUSHING DEVICE.

A device for adapting a three-jaw chuck to take a number of long bushings when the latter are to be ground on the inside is illustrated at Fig. 3. It is serviceable when the grinder must pass through the bushings, calling for a clearance between the end of the work and the face of the chuck.

Three equi-distant spaces are marked off on the chuck and holes drilled through. Three pins are then turned to the shape shown in the sketch. The ends of the pins are threaded to take retaining nuts, and the pins also are drilled and tapped at the other end to take the screw members holding the work.

When these auxiliary jaws are utilized, the bushing is centred in the usual manner, and the steady screws adjusted to the work. If necessary, and where great accuracy is required, lock nuts may be fitted to the set screws. The device may also be utilized in boring long bushings, and extra screws could be made for different work. Jaw chucks having T slots are applicable to this method, but specially shaped T ends would be necessary for the steadying members.

BUSHING SPRING SHACKLES.

With the increasing number of commercial cars the progressive proprietor of the repair shop is formulating plans for handling the business vehicle. The spring shackles and bolts are subject to wear, the latter very often wearing oval holes in the shackle and bracket. When such is the case a repair may be completed by fitting a case hardened bushing, provided there is metal enough round the hole, and the new bolt should also be case hardened.

Before hardening, however, a hole should be drilled through the bolt, and another opening made diametrically to meet it. The longitudinal hole should be tapped to take a grease cup, and a flat filed upon the bolt at the point where the other hole is drilled. This will insure proper lubrication of the parts.

AIR COMPRESSOR LUBRICATION.

The lubrication of air compressors deserves careful attention, says Graphite, and a common fault is to use too much oil or a lubricant having too low a flash point. An air compressor does not require as much lubrication as a steam cylinder and too much tends to cause the valves to stick, thereby necessitating frequent cleaning. The use of kerosene for removing the deposits is not recommended as it is likely to produce an explosion.

A practical method of lubricating the cylinders of air compressors is with a mixture of soapy water and flake graphite. Such a combination is

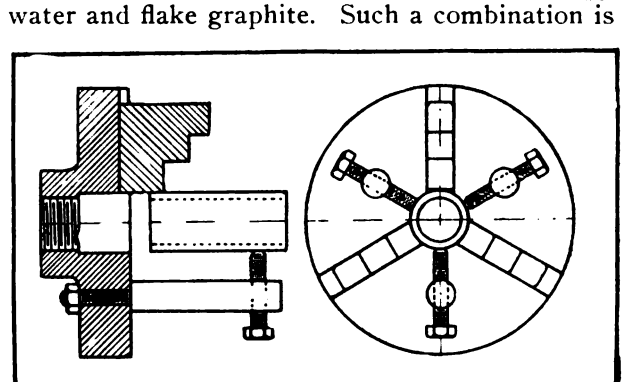

Fig. 3—A Device Applicable to the Chuck When Bushings Are to Be Ground or Bored.

not only safe to utilize, but keeps the valves clean. The use of a little oil is recommended when shutting down the compressor to prevent

Digitized by Google

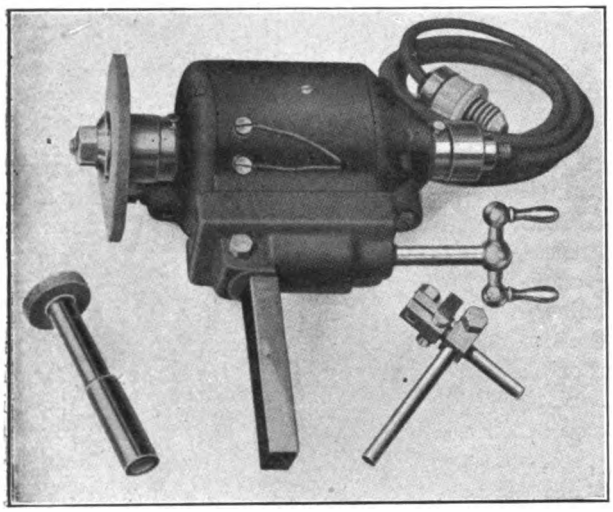

Fig. 4—The Hisey Direct Current Portable Electric Tool Post Grinder.

any tendency of the soap suds to cause rusting. The Joseph Dixon Crucible Company, Jersey City, N. J., publishes a booklet upon the subject which will be mailed free upon request.

HISEY ELECTRIC TOOL POST GRINDER.

The Hisey portable electric tool post grinder, manufactured by the Hisey-Wolf Machine Company, Cincinnati, O., is designed for a variety of work, such as grinding lathe centres, cutters, reamers, dies, rolls, etc., and for surface, parallel and internal work of all kinds. It is made in two types, A and B, operated by a 110 and 220-volt direct current and comes complete with wheels, cord and attachment plug. With the 110-volt grinder the following parts are furnished: One emery wheel, 4.5 by .375 inches with a .5-inch hole; one extension mandrel, 4.5 inches long by .75 inch diameter, with wheel 1.5 by .375 inches with .375-inch hole, and one tool rest.

The extension mandrel is utilized for internal grinding by removing the regular wheel and screwing the mandrel to the spindle. The latter is equipped with special bronze bearings, adjustable to wear, and provided with dust proof caps, these preventing foreign elements from reaching the working parts. The brush holders are also enclosed protecting the operator, and may be renewed easily without disturbing the leads.

The motor is air-cooled by means of a fan attached to the armature spindle. A quality claimed of the tool is that rotation of the emery wheel may be reversed by simply changing the position of the two wires on top of the motor housing, the operation requiring no tools.

The V slide has a three-inch travel by means of a worm, through the handle, and is fitted with a gib to take up any wear. It is held in position with a screw clamp, so that different sized shanks may be employed. The tooth rest is an attachment and serves as an index for grinding cutters, reamers, etc. Each attachment plug has a fusible cap protecting the motor from overload. The speed of the type A grinder under load is 4200 revolutions a minute. The dimensions are 4.25 by 7.75 inches, and the weight 16 pounds.

WHY THE TURNTABLE.

It is surprising the number of stables, etc., which have been converted into garages and many of these are not suited to the convenient storage of automobiles in that the building has either a long, narrow entrance to the main floor or the shape of the latter precludes easy entrance and exit when the majority of the spaces are occupied.

Under such conditions the customer is obliged to change speeds repeatedly in running his machine into its space, imposing unnecessary wear upon the mechanism, to say nothing of the possible damage to the other cars. Besides this is decidedly inconvenient to an owner who desires his machine in a hurry, especially if another customer is taking out his car.

These conditions are overcome by the turntable, which permits of swinging the machine to any desired angle. Another quality of the device is that considerable time is saved by the night washer, who is enabled to roll the machine upon the table, rotate it, and push the car to the wash-

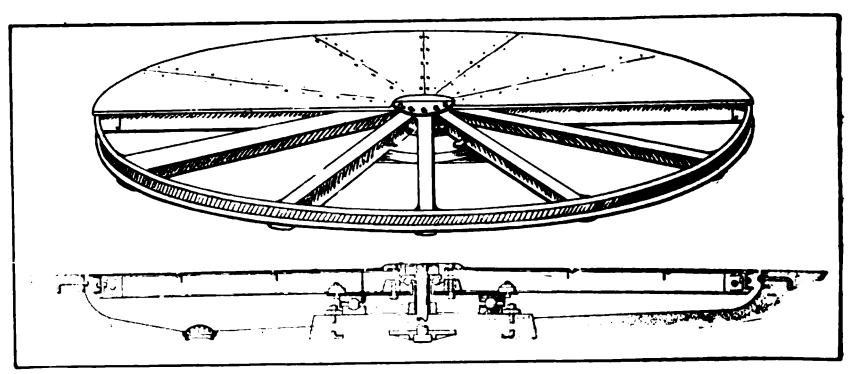

Fig. 5—The Beach Ball Bearing Automobile Turntable.

Digitized by Google

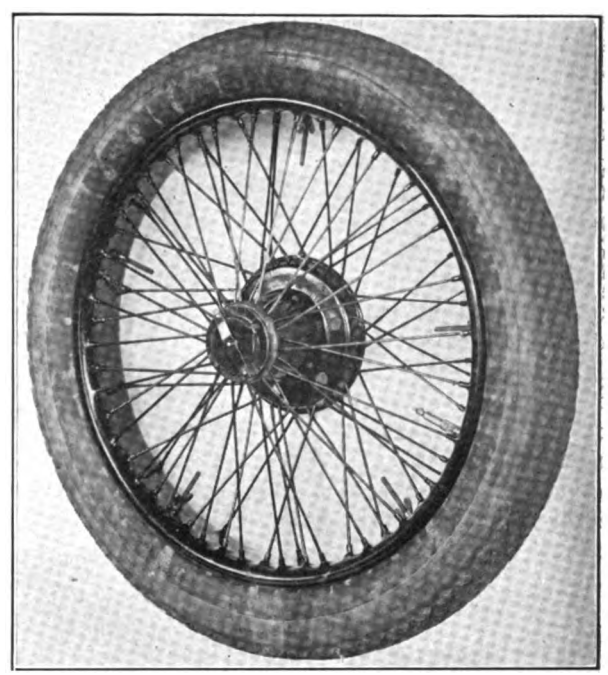
stand without unnecessarily straining the steering mechanism.

In order to meet the demand for a turntable which may be installed without making alterations to the garage floor, the T. C. Beach Company, Inc., St. Johns, Mich., is manufacturing a pitless table. The design is such that the use of tracks, trucks or wheels is eliminated and its installation does not require the services of an expert. It comes complete and the only work required is to bolt it to the floor.

The standard type steel table is shown at Fig. 5, the drawings illustrating the top and sectional views, and the table is made in five diameters, ranging from 10 feet to 16, with wheelbase limits of 92 to 170 inches. The table is counter balanced and rotates on high grade ball bearings of ample size, as will be noted in the illustration.

The same principle is utilized with the pitless table. The rigid steel frame revolves just above the floor and is provided with two steel runways fitted with automatic approaches at the ends, allowing the car to be run on or off at any point as with the standard type. This design eliminates the pit, and is easily installed. It is made in five sizes, with table diameters ranging from 10 to 15 feet and wheelbase limits of 92 to 156 inches.

REPAIRING LEAKY METAL FLOATS.



Metal floats ordinarily do not give trouble, but if the walls become punctured through misuse or wear, the mixture will become rich and the exhaust will give off clouds of dense black smoke. If the float be suspected of causing the trouble it may be tested by heating it, then applying a flame, when the leak, if any, will be detected. The aperture should be marked with a pencil, then stopped by a very fine film of solder. This is a delicate task as the balance of the float may be disturbed. After soldering the surplus should be removed with a piece of very fine emery paper, removing as much of the solder as possible. The float ought to be tested for balance before replacing in the float chamber.

WHITE'S NEW BOSTON BRANCH.

The White Company of Boston, the New England branch of the White Company, Cleveland, O., maker of White pleasure and commercial lines, has completed the preliminary arrangements for the erection of a new sales and service station at 1024-28 Commonwealth avenue. The concern has sold its present building on Newbury street, corner of Hereford, and purchased more than an acre of land at the new location. Clinton J. Warren has been selected as architect and has the plans for the new building well in hand. The salesroom alone will measure 84 by 95 feet, and the service station will be one of the most complete automobile buildings in the city.

GOODYEARS ON STUTZ WINNER.

An accompanying illustration presents the wire wheel utilized by Gilbert Anderson on the Stutz car, with which he finished in third place in the recent Grand Prize race at Milwaukee. It will be remembered that this machine was the

Wire Wheel and Goodyear Tire Utilized on Anderson's Stutz in Recent Grand Prize Race.

only one of American make to finish with place in this event, and at the same time it was the smallest car to finish with place in any contest for this award.

But particular attention is called here to the tire, which was made by the Goodyear Tire & Rubber Company, Akron, O. It is stated by the company that the shoes were purchased at the Indianapolis branch, and even the officials at the branch did not know to what purpose they were to be put. They were stock tires in every sense of the word, and that it became necessary to stop but once throughout the long race for tire replacement is of special interest.

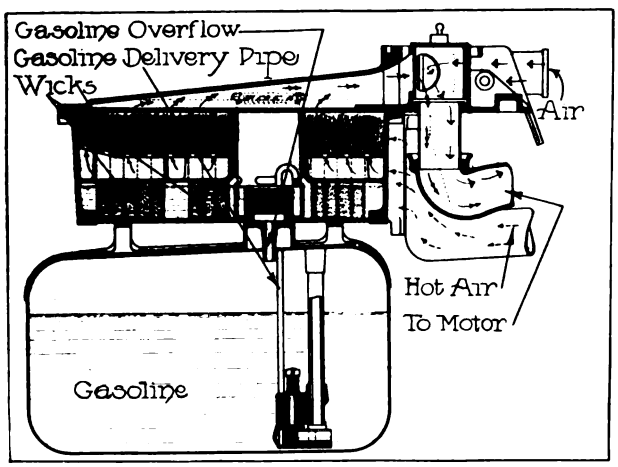
Few British concerns enjoy a better reputation than the Lanchester Motor Company, Ltd., Armourer Milles, Sparkbrook, Birmingham, England. Its product is of decided interest, largely because of its novel features, and because F. W. Lanchester has been designing automobiles since early in the '90's. While the car described herein is termed a 1913 model, this is due to its appearance at the recent Olympia show in London, rather than for the reason that it is a distinctly new production. The company maintains that it introduces improvements as they are found to be practical, and that such refinements are embodied in each lot of cars manufactured.

Two models are produced for the 1913 season, these being a 25 horsepower, four-cylinder car and the 38 horsepower, six-cylinder machine illustrated herewith. There is practically no difference between the two, except in the size of the motor and in the body designs. Both have the vertical engine, epicyclic gearset, multiple disc clutch and drive by cardan transmission to the worm driven live rear axle. The wick carburetor, which has been a standard feature on all Lanchester cars, is continued. The four pressed steel tubular frame members have been discarded for a channel frame of more orthodox form. Other details will appear below.

The vertical cylinders are cast in pairs, these being bolted to the crankcase separately. The valves are mechanically operated by means of side levers arranged vertically and enclosed in cam boxes which form oil reservoirs, so that the cams and the portion of the levers on which they operate always are immersed in lubricant. Flat springs are used in place of the usual coil members to return the valves to their seats. It is maintained that this form has the advantage of being capable of easy replacement.



While the cylinders are made of a special grade of cold blast iron, the pistons are of drop forged steel, as are also the connecting rods. The chrome nickel steel crankshaft is cut from the solid and provided with bearings of special alloy

Side Elevation of the 38 Horsepower, Six-Cylinder Chassis, Produced by Lanchester Motor Company for 1913 Season.

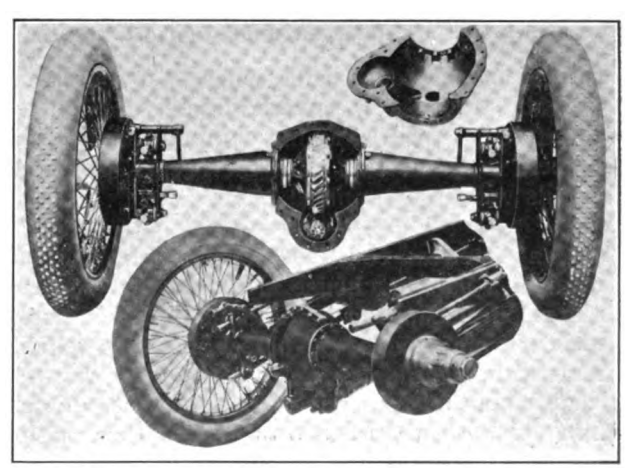
white metal cast into brass shells. Lubrication is by pressure feed. Cooling is by the thermo-syphon system, a pump being employed only

Sketch Showing Detail of Lanchester Wick Carburetor.



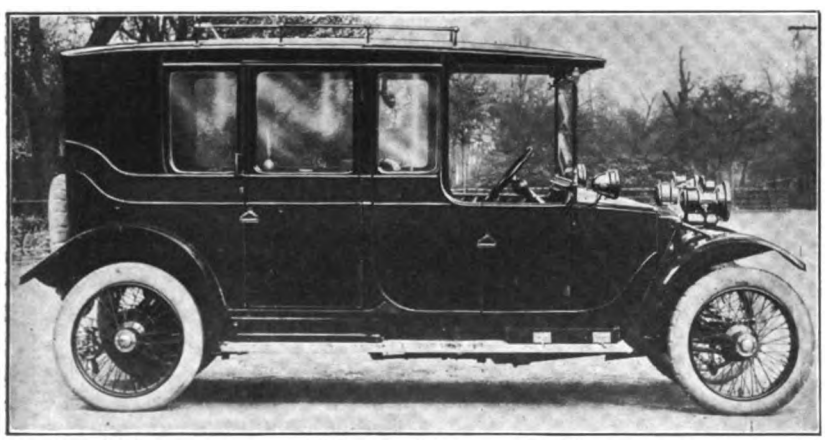
with the six-cylinder engine. In both cases the water passages are large and the ample radiator cells are arranged in parallel. Ignition is by high-tension magneto.

The carburetor is of the same type as that described in the first driving manual issued by the company. It is held to be the first vaporizer in which the wick system was utilized. Advantage is taken of the fact that the wick will suck up oils of different density, without discrimination. Volatilization takes place from the upper portion of the wick, warmed air being drawn through the wick chamber on its way to the motor cylinders without being allowed to come in contact with the body of the fuel. In this manner it is claimed that the gasoline is forced to volatilize in just the same proportion as it exists in the tank and rises in the wick, and the mixture is held to be more constant than with the best spray carburetor.

The location of the power plant is considered very important. Instead of being mounted over the front axle, the motor proper extends back of the dash, and the body work is arranged so that the leg spaces for the front seats lie on either side of the engine. The unit comprises the motor, gearbox, clutch and brake.

The gearbox is attached directly to the rear end of the crankcase, and three forward speeds and a reverse are provided. It contains three trains of epicyclic gearing, these being in three drums. The first is the reversing gear, the second the low speed, and the third the second speed. The crankshaft of the motor passes through the gearbox and drives direct on the clutch driving sleeve. The three gears, used alternately, drive a bell shaped disc which carries three lugs on its exterior. These lugs drive the clutch box or outer element of the clutch, which is in permanent connection with the transmission. The gears are actuated by arresting the motion of the drum belonging to the gear that is required. This is effected by means of a brake, three of these members being contained within the gearbox and being alternately acted upon by the change gear selector. The brake box contains the countershaft brake which acts on the arbor shaft in constant connection with the main transmission. This brake also is of the multiple disc type, and the outside of the box is ribbed in order to dispose more rapidly the heat generated while descending long gradients.

At the extreme rear end of the countershaft is the driving pot, a portion keyed on the arbor shaft, which constitutes the anterior universal and sliding joint of the coupling shaft, by which power is transmitted to the rear axle. This axle consists of an oil tight casing, the main components of which are the worm gears and two side tubes through which the axles pass. A central malleable casting, divided vertically through the centre, the rear portion being made detachable for inspection, contains the worm and worm wheel. The worm is mounted in hard steel roller bearings, which run in hardened steel races, the thrust being taken by an independent ball bearing of heavy proportions. The worm wheel carries within it the differential gear, consisting of four bevel pinions mounted on a four bearing star. The extremities of these bearing pins terminate as keys or tongues, which engage in slots in the interior of the worm wheel.



Rear Suspension on Lanchester Cars, Indicating Type of Worm Utilized and Detail of Detachable Wire Wheels.

Digitized by Google

As an indication of the interest that has been awakened in motor starters abroad, the Lanchester company is prepared to fit an electric starter this year at an extra charge. It takes the form of a dynamo-motor mounted on a bracket projecting from the brake casing, and is chain driven off the transmission shaft. The spindle is fitted with a pinion meshing with teeth cut on the flywheel, and is slid into engagement by means of a lever placed at the driver's left. When not operating as a starter, the motor becomes a dynamo acting as a charging apparatus for the batteries and for lighting.

The Royal Swedish Automobile Club proposes to make its forthcoming winter reliability run between Stockholm and Gothenburg and return, a more difficult event than hitherto. The route north will be along the Wener lake and return along the south bank, where it is more than probable that snow covered roads will be encountered. A hill climbing competition also will be held in connection with the event. Complete details will be announced later.

The Empreza Autoviaria Paulista, registered in Sao Paulo, Brazil, is issuing a loan of $650,000 for constructing the first section of an automobile road between Sao Paulo and Santos. The original route chosen for the road has been altered and it is hoped that when it is completed it will only take an hour to journey from one city to the other.

—— * ——

Definite information has been received from the front that motor trucks are being successfully used in large numbers by both Turkey and the Balkan States. This is the first time that these modern transport vehicles have been tried out in such service, although steam tractors were used by the British in the Boer war. Except for heavy grades the roads along the Balkan-Turkish frontier are reported to be good, so that motor vehicles will have no difficulty in living up to the reputation gained in the recent European and American military manoeuvres.

They have been of especial utility in removing the wounded to the nearest hospitals and particularly on the side of the Balkan States have provisions and ammunition been promptly supplied to the fast advancing armies; in fact, it is doubted if the advance could have been made so swiftly at some points had the commissary and ammunition departments been forced to rely upon the horse drawn vehicles.

As an example of how extensively the European nations are preparing to use motor cars for war a recent statement cited that under the German subsidy that government now has 70,000 vehicles available for army service, divided as follows: Motorcycles, 20,500; pleasure cars, 23,000; tradesmen's vans or delivery wagons, 20,000; motor trucks and omnibuses, 7100.

—— * ——

It seems reasonably sure that automobile racing will be resumed in 1913 on the Isle of Man, for according to a recent issue of the Isle of Man Times it is stated that the Royal Automobile Club of England has practically decided to revive the events which were discontinued several years ago because of the hostility displayed by the residents of that section. This feeling has been superseded by one of friendliness towards the industry with the result that the competiton committee of the Royal Automobile Club has passed a resolution recommending a race next

Digitized by Google

year. Just what contests will be held has not yet been determined.

Plans have been drawn up at Geneva for the construction of a Swiss thoroughfare similar to that which the French Alps possesses in the high road from Evian to Nice. The Swiss route would, as projected, lead from Chamonix to Martigny in the Rhone valley.

—— ★ ——

A report from an American consular officer, listed under file No. 9846 by the bureau of foreign and domestic commerce, Washington, D. C., states that a business firm desires to secure the representation in Germany and Russia of a first class, moderate priced automobile, particularly a four-passenger, four-cylinder, 20 horsepower car, at a factory price about $1000, complete with cover and accessories. This company expects to be able to import upon a large scale and to build up a very complete selling organization in both countries, especially in Russia, where it already has good connections in the largest cities. The concern now represents 17 different well known manufacturers of machinery of various classes.

—— ★ ——

The first meeting of the North of England branch of the Institution of Automobile Engineers was held recently at the university in Manchester, when John Okill of the Liverpool university, read an interesting paper on "The Otto Cycle and the Fuel Question." T. B. Browne, president of the institution, presided at the meeting. After dealing with the historical aspect of the Otto cycle Mr. Okill described a number of kerosene carburetors and gave a brief review of the economical advantages of the Diesel engines.

Mr. Okill showed an arrangement of an engine designed by himself. This motor could be started as a low compression engine on electrical ignition in the ordinary way. By raising a sleeve, thereby isolating the combustion chamber from the valve pocket, when well under way, it is converted into one running on the Diesel principle. The design received a great deal of criticism during the discussion, based upon practical difficulties of construction, although the critics expressed appreciation of the idea.

The Cologne Gazette, a semi-official paper at Berlin, Germany, has issued a word of advice to German motor car manufacturers relative to the threatened invasion of that territory by American makers. The German producers have appealed to the government to protect them against the invasion, but the Gazette advises the automobile men to awaken to the true significance of the situation and prepare themselves to meet conditions by improving their own methods. It says:

Many German manufacturers, including some of those who are most threatened by trans-Atlantic competition, allege that they do not see anything of the danger yet. That is about the same as if a general were to dismiss statements about a hostile army, of whose approach he had heard by telegraph, as unworthy of serious consideration because the army was not yet in sight. Let it be borne in mind that only the man who is well prepared can meet all the emergencies. Next spring will reveal a different state of affairs in our automobile market. The assumption that the Americans will not be dangerous because of the failure in the past of two isolated companies is foolish, simply for the reason that in those days the small, cheap car was only in its swaddling clothes and therefore did not enjoy much popularity with buyers.

Today there exists a market, made ready by skillful methods and excellent products. The Americans are now about to campaign for business in the Fatherland, with characteristic energy and dash. Their natural allies are their cheap prices, their noisy advertising methods and the mistaken passion for money saving on the part of the German buyers. What is going to help the Americans most, however, is the suicidal indifference of our manufacturers to the danger threatened to German industry.

—— ★ ——

The English method of operating taxicabs in certain cities is of considerable interest to the uninitiated. For instance, Sheffield supports about 100 machines. The field is of course more limited than is the case in London, so the rates are higher. The fare in Sheffield is 24.3 cents for the first mile and six cents for each .25-mile thereafter. This rate is for one to four persons and includes such baggage as is carried inside. For outside luggage a fixed charge of six cents a piece is added to the cost of the journey.

The driver of a taxicab is responsible for all detachable parts and any breakage due to carelessness is charged against an insurance fund which he creates by the payment of 12 cents a day until he has to his credit the sum of $12.16, which is returned when he leaves the employ of the company. The driver pays for the gasoline for his car at the rate of 32 cents a gallon and he also pays 12 cents a day for cleaning and overhauling the vehicle. He is not paid a salary, but is allowed 25 per cent. of the fares registered.

—— ★ ——

Vancouver Island, in British Columbia, offers splendid inducements for touring. It has a length of 350 miles and is covered by a network of roads, 50 per cent. of which would be classed by Americans as boulevards. M. G. Johnson, manager of the Howard Automobile Company, Portland, Ore., recently returned from a trip to Vancouver and says he believes that when American motorists have become sufficiently acquainted with the road conditions available, they will visit there in great numbers.

RECIPROCITY IN NEW JERSEY.

That the legislature of New Jersey is to be called upon to fight the battle of automobile reciprocity all over again seems to be the opinion of those who have been watching the situation in that state of late. At a recent meeting of the Pomona Grange in Burlington, action was taken looking toward an organized movement among the members of this order for changes in the present law.

The state commissioner of motor vehicles, Job H. Lippincott, raises the old claim that non-resident motorists are causing unlimited damage to New Jersey roads. He maintains that it is impossible properly to enforce the law with the present force, and has asked for an enlarged appropriation. This, he holds, will make necessary an increased license fee, and he adds that the resident motorists should not be forced to assume this added burden alone.

The trouble seems to lie in the so-called reciprocity provision, which limits the visits of non-residents to 10 in any one calendar year. Inspectors are posted at all principle points of ingress, there to keep track of the number of times visiting motorists cross the state line. It is obvious that there are so many roads leading into Jersey that a large force of men is required for this work. It also is claimed that many residents of New Jersey have taken out licenses in other states in an effort to escape taxation in their own commonwealth. There is a fine of $100 provided for such violation of the law, but it is maintained that it is a difficult matter to secure evidence.

Col. Edwin A. Stevens, road commissioner for New Jersey, holds a somewhat different opinion regarding the damage to highways. He contends that horse drawn vehicles should assume some of the burden of taxation in this particular, although he has not yet made up his mind whether to introduce an amendment calling for such legislation.

WANT NEW LAW IN MARYLAND.

The Automobile Club of Maryland, Baltimore, Md., has begun a campaign for a new automobile law in 1914, when the next session of the legislature will be held. In order to present the best possible showing in this effort, the club is urging all motorists in the state, of whom there are some 7000, to become members of the organization. An appeal also has been addressed to the motorists of the District of Columbia, suggesting: "We want and you want reciprocal relations. The place to get them is Annapolis—1914. Let's get together."

The address to Maryland owners includes the following: "We want to take before the legislature of 1914 a sane, just and fair automobile law—fair to the horse drawn vehicles, fair to the pedestrian, fair to the motor vehicles. We need your help and you need ours."

SEVERAL BILLS IN NEW YORK.

Several important amendments to the motoring law in New York State are being considered for introduction into the next session of the legislature. The New York State Automobile Association will take action on these at its annual meeting in Utica, Dec. 11-12. The following suggested amendments have been made public:

Requiring all operators of cars to be licensed; providing a flat horsepower registration fee instead of a graduated tax; prohibiting the enactment of local speed ordinances; prohibiting the use of manufacturers' and dealers' "M-plates" except on demonstrating cars or in removing a car from place to place for the purpose of sale,

Digitized by Google

manufacturers' plates in duplicate to have separate marks of distinction; exempting from tax only cars owned and controlled by state and municipal authorities and used exclusively for official business; permitting non-residents registered in other states to operate cars in New York State for an unlimited period; abating the smoke nuisance and unnecessary noise; requiring number plates to be kept reasonably clean and prohibiting the loaning, renting or changing of number plates from one car to another; requiring public garages, as well as manufacturers and dealers, to keep a record of every automobile which enters or leaves a garage; making the operation of a car by an intoxicated person, or in a careless or reckless manner, a criminal offense punishable upon conviction by imprisonment; giving to the state power to suspend or revoke an operator's permit for cause after a hearing; giving the state automobile inspectors the power of constables except for the service of a process; requiring motorcycles to be registered.

LIGHTS IN CONNECTICUT.

As a result of a fatal accident in Bridgeport, Conn., the people of that commonwealth have been aroused to the desirability of enacting a universal lighting law. In 1902, before the automobile was in extensive use in Connecticut, the legislature passed the following law:

All rubber tired vehicles while in use in the public streets and highways shall show, from one hour after sunset to one hour before sunrise, a light or lights, so placed as to be visible from the front, except that no light shall be required between the hours of 5 o'clock in the morning and 7 o'clock in the evening. Such light or lights shall be of a sufficient illuminating power to be visible a distance of 200 feet.

This statute was revised in 1907, when the light regulations were made to apply only to motor vehicles, and the hours were changed to 30 minutes after sunset and 30 minutes before sunrise. The statute was revised again in 1911, but motor vehicles only were included as before. It now appears that the incoming legislature will be asked to enact a law covering all classes of vehicles using highways during hours of darkness.

NEW AMENDMENTS IN OHIO.

The Cleveland Automobile Club, Cleveland, O., through its attorney, John A. Alburn, has drafted two new amendments to the present motoring law of that state, which will be introduced in the legislature at its forthcoming session. One has to do with universal lighting and the other with providing a penalty for the theft of automobiles. At present the theft of a horse is punishable by penitentiary imprisonment for one to 10 years, while a valuable car may be stolen and wrecked and the culprit usually gets off with a nominal fine. The two bills follow:

To Amend Sec. 12,614.

Section 1. That sec. 12,614 of the general code of Ohio be amended so as to read as follows: Whoever operates or drives a motor vehicle upon the public roads and highways without providing it with sufficient brakes to control it at all times and a suitable and adequate bell or other device for signalling, or fails during the period from 30 minutes after sunset to 30 minutes before sunrise to display a red light on the rear thereof and three white lights, two on the front and one on the rear thereof, the rays of which rear light shall shine upon and illuminate each and every part of the distinctive number borne upon such motor vehicle, the light of which front lamps to be visible at least 200 feet in the direction in which such motor vehicle is proceeding, shall be fined not more than $25; and whoever operates or drives any horse drawn or other vehicle upon the public roads and highways during a period from 30 minutes after sunset and 30 minutes before sunrise without displaying thereon a light the rays of which shall be visible at least 200 feet to the front and 200 feet to the rear of such vehicle, shall be fined not more than $25.

Sec. 2. That said original sec. 12,614 of the general code be and it is hereby repealed.

To Amend Sec. 12,619.

Section 1. That sec. 12,619 of the general code be amended so as to read as follows: Whoever drives or operates or causes to be driven or operated upon the public road or highway a motor vehicle, in the absence of the owner thereof and without such owner's written consent, shall, if the value of such motor vehicle is $35 or more, be imprisoned in the penitentiary not less than one year nor more than seven years, or if the value is less than that sum, be fined not more than $200, or imprisoned not more than 30 days or both.

Sec. 2. That said sec. 12,619 of the general code be and the same is hereby repealed.

ANOTHER FEDERAL AID CONVENTION.

The second federal aid good roads convention will be held in Washington, D. C., March 6-7, 1913. Inasmuch as President-Elect Wilson has advocated the position maintained by those responsible for these conventions, it is anticipated that his administration will establish the policy of road building as one of the functions of the national government.

PROTEST MOTOR TRUCK TAX.

The recently organized Motor Truck Club in Los Angeles, Cal., has filed a determined protest against the adoption of the proposed ordinance fixing a tax of $10 for motor trucks of 30 horsepower and less and $20 for those of over 30 horsepower. The same ordinance provides that vehicles drawn by one horse shall be taxed $2.50; two horses, $5, and more than two, $10. The club asks that motor vehicles be rated according to carrying capacity instead of horsepower.

PERFECTING PLANS FOR THE NEW YORK SHOW.

ALTHOUGH the show season is still some distance in the future, active preparations for the national display in New York City, which is to be held in two sections and in two buildings, have been under way for months. Plans for remodelling the interior of Madison Square Garden and the new Grand Central Palace, to accommodate the concerns represented by the rapid growth of the automobile industry, have been completed, and contracts for steel construction, decorating, sign making and the other branches of the exhibition have been awarded.

Pleasure cars and accessories are to be shown in both buildings during the week of Jan. 11-18, and commercial vehicles, motorcycles and accessories Jan. 20-25. The interior of Madison Square Garden practically will be reconstructed as the contract for steel is large enough to provide material for the erection of a good sized building in itself. The skeleton steel work which will support the balconies will be erected entirely independent of the support from the walls of the Garden. The interior of the Grand Central Palace will be enriched with trellis work and floral decorations. Aside from this preliminary announcement, the management considers a further description to be somewhat premature at this time.

Prize Poster for New York Display.

An accompanying illustration presents the attractive poster design, which has been selected as a result of an open competition in which no less than 92 designs were submitted by as many artists. Several of these were fine indeed and the judges experienced no little difficulty in making the award. The black and white reproduction does not do entire justice to the poster, which has a background of very dark blue. The lower portion, a section of the car's tonneau, is a reddish brown, the border and upholstery are in emerald green, while the lettering is yellow for the most part, as are the high lights of the picture. The artist is Lambert Guenther of New York City, who secured a prize of $200.

Very little space in either building is available for future allotment, but applications are still being received by Merle L. Downs, secretary of the show committee, at the offices of the Automobile Board of Trade, 7 East 42nd street, New York City.

CLEVELAND BEFORE NEW YORK.

The first showing of American automobiles in 1913 will be held in Cleveland, O., Jan. 4-11, thus antedating the New York display by one week. The dealers in Cleveland consider this result of an arrangement with the National Association of Automobile Manufacturers to be in recognition of their city as a motor car centre. Fred H. Caley, formerly state registrar of automobiles, will manage the exhibition again this year.

The committee has secured the new Wigmore building, which affords 63,000 square feet of show space. This is three times as much as was available in the Central Armory, where the 1912 display was made. From the number of applications already received, it is evident there will be none too much room.

PLANNING FOR PROVIDENCE DISPLAY.

Following the plan adopted by the Rhode Island Automobile Dealers' Association, Providence, R. I., last year, the annual Providence show will be held in the state armory, Cranston and Parade streets, Jan. 25-Feb. 1, immediately following the commercial vehicle display in New York City. The management will be the same as in 1912, and all applications for space should be made to Arthur S. Lee, 52 Richmond street.

Thirty-eight thousand square feet of floor space is available for the exhibition of pleasure and commercial cars and accessories, and present indications would seem to insure that it all will be filled. The interior of the armory lends itself admirably to a special decorative scheme, and it may be stated that the treatment will be quite as striking as that which marked the display a year ago.

SPEED

Four Years Ahead of Our Nearest Competitor, Five Years Ahead of the Rest.

Self-Starting
Two Speeds

THE FLYING MERKEL

Spring Frame
Spring Fork

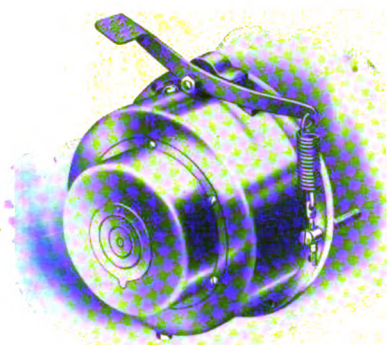
DECLARATION

The new and sweeping improvements found *exclusively* in the 1913 Flying Merkel Motorcycles mark the greatest advance yet made in motorcycle construction. They amount to little less than a revolution in the industry. All other makes are placed just about five years behind the times by comparison with the Self-Starting Two-Speed Flying Merkel.

Read the whole story of these wonderful improvements and you will say with us: "The ideal motorcycle has at last arrived!"

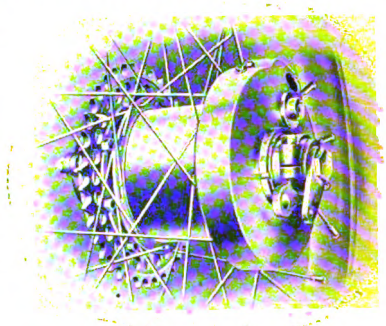
Thirteen years of careful, painstaking manufacture have been necessary in order to achieve the high degree of perfection now attained in the 1913 Flying Merkels.

We have just completed an immense addition to our factory, and have filled it with nearly a half million dollars' worth of the most modern machinery, in order to insure absolute reliability and perfection in this masterpiece of motorcycles.



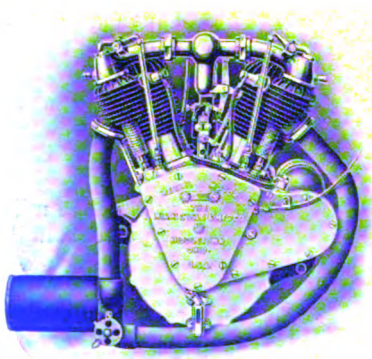
Some of the most efficient productive engineers known to the cycle and automobile industry have been added to our staff. We have installed a new system of inspection which is the most rigid and thoroughgoing in existence. Because of its great cost this system heretofore has been applied only in plants making $5,000 automobiles and high-grade watch manufactories. Every single part which enters into the construction of the 1913 Flying Merkel Motorcycle must measure accurately to the one-tenthousandth part of an inch. Our materials are the best the world knows and of special analysis.

Yet with these enormous facilities and this increased power of production we could easily double the limit of production we have set. However, we shall leave "quantity" production with its attendant short cuts and rush methods to our competitors. For ourselves, we prefer to make half as many, but MAKE THEM RIGHT.

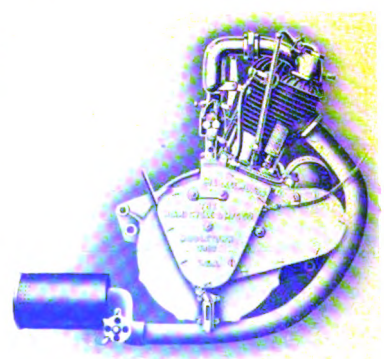


The Miami Cycle & Mfg. Co.
320 HANOVER STREET.
MIDDLETOWN, OHIO
MEMBER M.M.A.

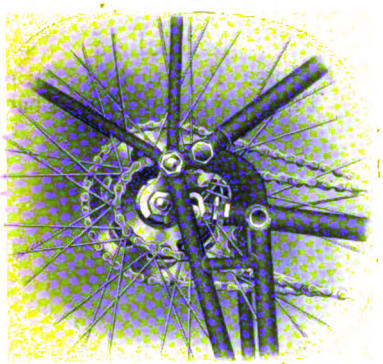
POWER MIAMI COMFORT



Some Flying Merkel Features

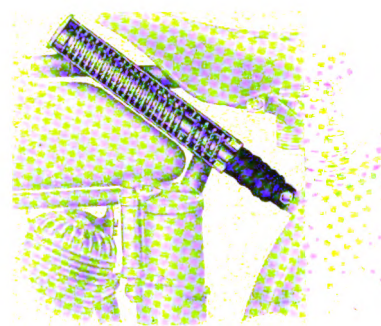


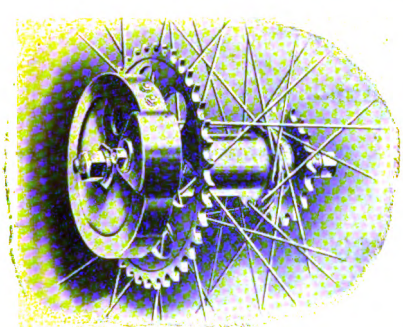
SELF-STARTER — Heretofore only the highest priced automobiles have been fitted with this wonderful labor-saving device. The Flying Merkel Motorcycle positively will be the only motorcycle fitted with a Self-Starter. The adoption of a Self-Starter on a motorcycle presages a revolution in the motorcycle industry. The Flying Merkel Self-Starter is a compact device, adding practically no extra weight or bulk to the machine, and is started by a slight pressure of the foot on the pedal. It is a positive acting self re-winding starter and of the type which has proved the **only** successful starter on automobiles.



TWO-SPEED-HUB—The combination of a Self-Starter and Two-Speed-Hub instantly makes the 1913 Flying Merkel Motorcycle the most luxurious two-wheeled vehicle ever placed before the public. The Two-Speed gear is located in the rear hub and is of the sun and planet type. Gears are always in mesh, preventing any possibility of stripping teeth, and so designed as to be practically noiseless. The reduction is 1.5 to 1. Control is by lever at side of tank.

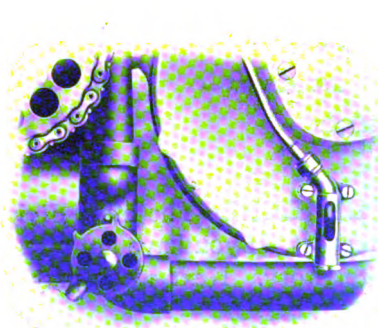
POWERFUL TWIN MOTOR—The 1913 motor is entirely new and more powerful, speedier and more flexible than any of its predecessors. It is a long-stroke motor, having a bore of 3¼ inches and stroke of 3 43-64 inches, giving a piston displacement of 60.89 cubic inches. The world-renowned Hess-Bright ball bearings are used throughout, these being of entirely new design and made especially for us in Europe. No expense has been spared in making this the finest motorcycle power plant in the world.





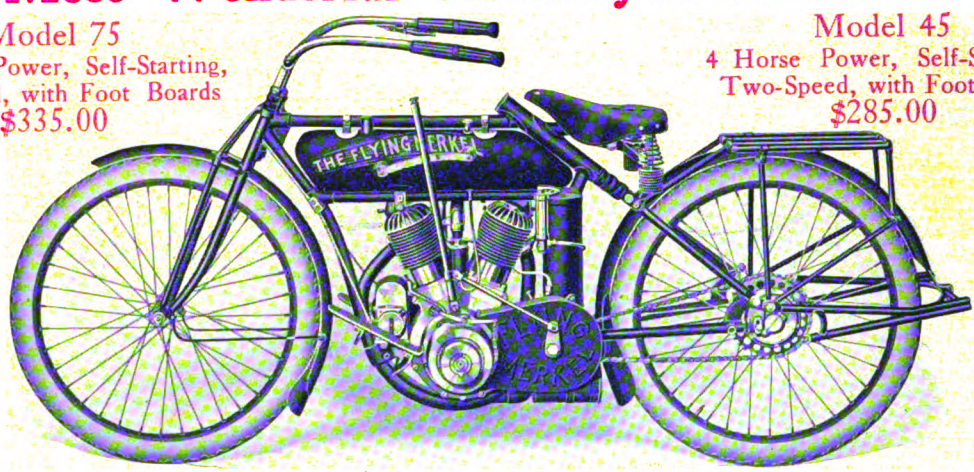
FOUR HORSEPOWER MOTOR—The single cylinder motor is identical in construction with the seven twin, with the exception of the number of cylinders. Bore and stroke are the same, the piston displacement of the single being 30.445 cubic inches. Valves on both single and twin are mechanically operated with adjustable valve tappets. The crank case, which is newly designed throughout, is made of the highest quality aluminum, beautifully polished. "The fastest and most powerful single" aptly describes it.

REAR WHEEL CONSTRUCTION—Every rider instantly will appreciate the value of this drop out rear wheel construction. A puncture on the road formerly meant arduous labor in squeezing out the rear wheel, skinned knuckles and lost temper. By simply detaching the chain and unscrewing the two axle nuts, the rear wheel can be removed in an instant without disturbing the adjustment. The entire rear frame structure is of special drop forgings. A new straight line support stand of triple truss design makes this item the simplest and at the same time the staunchest stand designed.



SPRING FRAME—Of entirely new design the 1913 Flying Merkel Spring Frame makes it still the most comfortable motorcycle in the world. One large spring with rebound spring and compensating pneumatic plunger, which is adjustable for riders of varying weights, makes it possible to ride over the roughest roads with no discomfort whatever. A hinged-joint shock-absorber still further promotes easy riding. The Spring Frame and Spring Fork features alone make the Flying Merkel the most desirable of all motorcycles.

BAND BRAKE OF NEW DESIGN—All twin cylinder models will be fitted with a new and powerful flat band brake, which leaves nothing to be desired in this very necessary factor for safety. While it has the most powerful gripping surface of any brake made, its action is gradual, a feature much sought after, but until now not attained by anyone. The famous Musselman Automatic Coaster Brake, so long and favorably known, will be fitted on Models 40 and 41.



MUFFLER CUT-OUT AND OIL GAUGE—This is the simplest and most effective cut-out yet designed. Easily operated by the foot it can be instantly opened or closed and always remains in the position set. The outside oil gauge is a distinctive feature and permits the rider to see the level of oil in the crank case without dismounting. The leaky, non-transparent crank case window which it replaces is now made obsolete by the introduction of the new outside protected oil gauge.

The Most Wonderful Motorcycle in the World

Model 75
7 Horse Power, Self-Starting, Two-speed, with Foot Boards
$335.00

Model 45
4 Horse Power, Self-Starting, Two-Speed, with Foot Boards
$285.00

SPECIFICATIONS:

MOTOR— Self Starter, Merkel Patented, Twin cylinder, 7 horsepower, bore 3¼ inches, stroke 3 43-64 inches. Displacement, 60.89 cubic inches. Hess-Bright ball bearings used throughout. Mechanically operated inlet valve, with adjustable tappet. Crank case of polished aluminum with new outside oil gauge.

CARBURETER— New Merkel-Schebler improved type with auxiliary air valve for high speed.

CONTROL— Merkel Patent leverless double handle bar control.

MUFFLER— Entirely new design, very compact and noiseless, fitted with positive self-adjusting cut-out, easily operated by foot.

TWO SPEED— Merkel Patented in rear hub, giving reduction of 1.5 to one. Operated by side lever with positive notched segment control.

FRAME— New improved loop design spring frame made of AA1 Standard Welding tubing. Low saddle position. All working joints covered with oil and dust-proof leather jackets. Fitted with foot boards.

WHEELS— 28 inches, 36 extra heavy motor spokes front and rear, new type single clinch auto-type steel rims for 2½, 2¾ or 3-inch tires.

FORKS— Merkel Patent Truss Spring Fork, a unit with front wheel, proved the safest and strongest fork in the world.

MUD GUARDS— Beaded edge, 4¼" wide, with leather flap front and rear.

WHEEL BASE— 55 inches, making unusually easy riding machine.

TRANSMISSION— One-quarter inch x ⅝" pitch roller chain.

BRAKE— New Flat Band Brake.

SADDLE— Choice of Persons' Champion, Troxel or Mesinger Superba.

TIRES— Choice of Federal, Goodyear or United States, 28x2¾".

IGNITION— Bosch, high tension, ball bearing, gear driven armored magneto.

LUBRICATION— New improved automatic drop feed throttle control with safety latch and auxiliary left side force pump.

TANKS— Stamped of special analysis sheet steel, heavily tinned inside and out and with triple baffle plates. Gasoline capacity, 2½ gallons. Oil tank integral with frame. Capacity, one-half gallon plus.

TOOL BAG— Metal case with burglar proof lock, attached to luggage carrier.

LUGGAGE CARRIER— Made of ½-inch seamless steel tubing, with cold rolled stamped connections and tubular braces.

PRICE.....**F. O. B. MIDDLETOWN**.....**$335.00**

ALSO Model 45, Self Starter, Two Speed, Chain Drive.....**$285.00**

$100.00 IN GOLD

Models 75 and 45 are the most wonderful motorcycles ever offered to the public and to make them justly famous all the world over, we will give $100.00 in gold to the reader of this paper who submits the most suitable name. There are no strings to this contest. Anyone can enter it and each entrant may submit as many names as desired. Simply write the names on a sheet of paper and mail to the address given below. A committee of five has been selected to decide the winner. The contest will close at noon Dec. 15. The Flying Merkel "Autocrat," "Rambler," "Tourist," etc., are some of the titles already submitted, but they lack ginger. Read the specifications carefully and send in your selections. **You** have as good a chance as anyone to win the $100.00. Get your friend to help you. Remember, the contest will close on Dec. 15 at noon.

TO DEALERS—The 1913 Flying Merkel Motorcycle will be the most popular machine on the market. If you have not already done so, it will be to your interest to wire today for terms and territory. Next week may be too late.

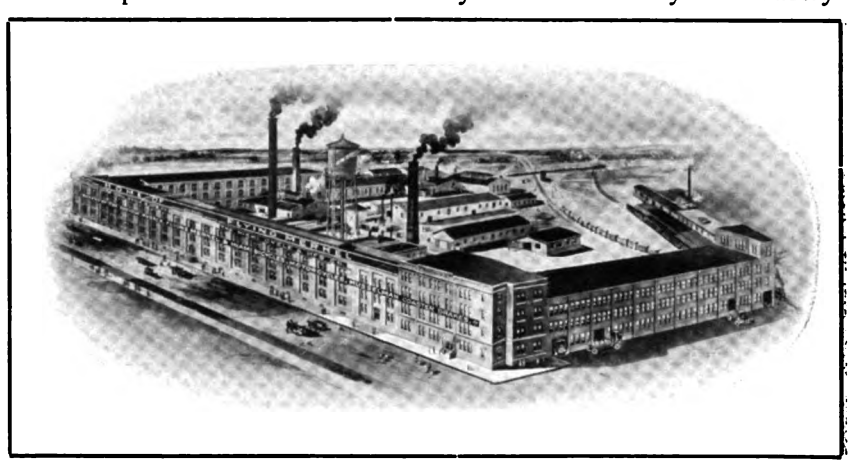
ACTIVITIES OF MOTORCYCLISTS, THE RIDER, THE MANUFACTURER, AND THE DEALER

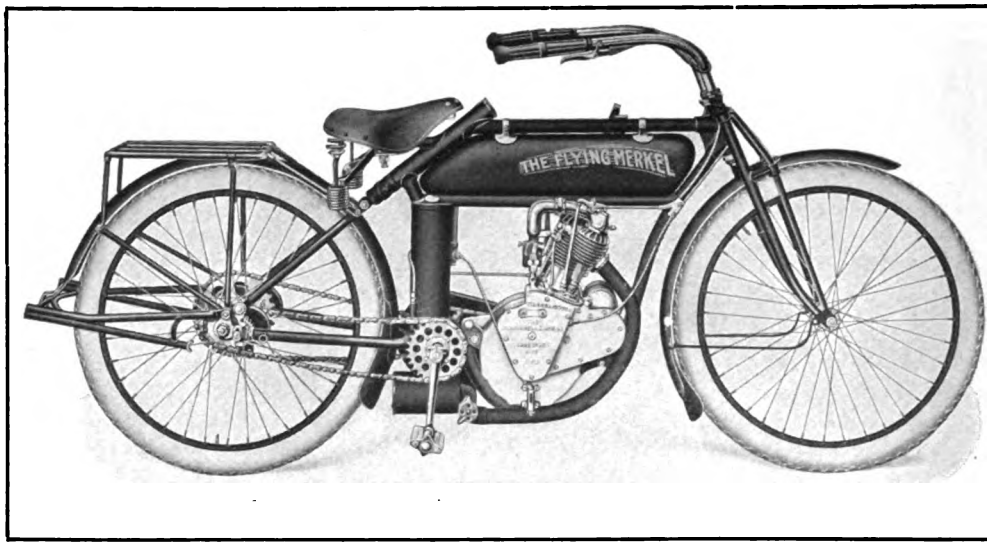


Self-Starter on Flying Merkel.

Radical changes mark the announcement of the Flying Merkel line for 1913. Not only has the machine been redesigned from tires to saddle, but it is the first motorcycle to be fitted with a self-starter. Other features are the two-speed gear, the adoption of mechanically operated intake valves with adjustable tappets, footboards on the two-speed models, lower saddle position, separation of gasoline and oil tanks, wider mudguards and heavier rims and tires. Six models are listed as follows: Model 40, four horsepower belt drive single; 41, four horsepower chain drive single; 45, four horsepower self-starting, two-speed single; 70, seven horsepower belt drive twin; 71, seven horsepower chain drive twin, and 75, seven horsepower self-starting, two-speed twin.

In the first place it should be stated that during the past few months the Miami Cycle & Manufacturing Company, Middletown, O., maker of the Flying Merkel, has erected a new addition to its factory, giving 55,000 more square feet of floor space. This has been equipped throughout with the most modern automatic machinery designed to do three times as much work as formerly was possible. The old machinery has been scrapped. Perhaps the greatest change in factory management is the adoption of a new system of inspection, which means that each single part of the 1913 Flying Merkel mounts, and bicycles and coaster brakes as well, must measure to within .0001 inch or fail to pass inspection.

New productive heads throughout the factory make it possible to increase the output of the plant from about 6000 machines a year to 20,000 or 25,000. Yet the policy insisted upon by President K. R. Jacoby is that instead of making this large quantity of mounts, the production be limited to half that number; in other words, just twice as much time will be devoted to each machine as would appear necessary on the surface. It is the wish to give the trade and the riders a motorcycle which leaves nothing to be desired which has dictated this policy.



In announcing the innovations represented in the 1913 Flying Merkel, Designer J. F. Merkel and the other officials of the company call attention to the history of the motorcycle industry which sets forth that it was a Flying Merkel which had the first loop frame, the first triple stem fork, the first double stem handle bar, the first spring frame and the first ball bearing motor. The old Merkel company was the first concern in the world to market a magneto model and the first to market magneto models exclusively. All these features are retained in the newer offerings, although changed in some of their details.

Enlarged Factory of the Miami Cycle & Manufacturing Company, Middletown, O, Maker of Flying Merkel.

The motor has a bore of 3.25 inches and stroke of 3.64, giving a displacement of 30.445 inches

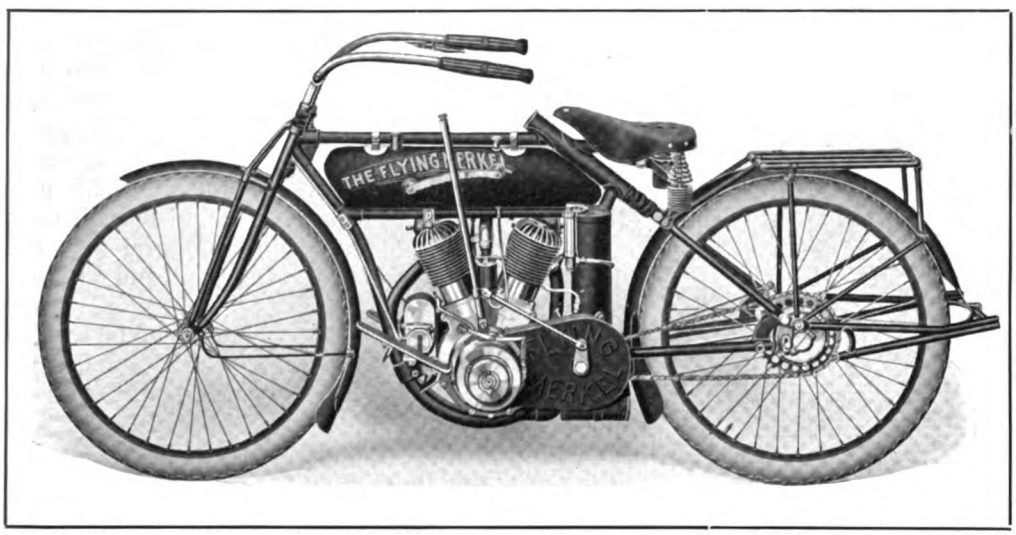
Flying Merkel Model 41, the Four Horsepower Chain Drive Single.

for the single and 60.89 for the twin. Hess-Bright ball bearings are used throughout. The crankcase is of polished aluminum with an outside oil gauge. The valves both are mechanically operated and made larger with an entirely new designed seat for the inlet. The tappets are adjustable. The manifold pipes are larger and are designed to be absolutely oil tight, insuring a perfect running motor at slow speeds. Priming cups of new design also are fitted, these being air tight. The cylinders have been redesigned and the spark plugs have been placed where they cannot foul from oil. Flywheels are made of drop forged steel with a new system of counterbalancing. The carburetor is a new Merkel-Schebler improved type with auxiliary air valve for high speed. Ignition is by a Bosch, high-tension, ball bearing, gear driven, armored magneto.

The tank is radically new and is made of two steel stampings, heavily tinned both inside and out, after being brazed together. On the interior are three baffle plates. This makes an unusually strong tank, and one which presents a very neat appearance. By tinning, it is held that the enamel will not chip off. The gasoline capacity is a little over 2.5 gallons. The oil tank is integral with the frame and the capacity is two quarts, plus. Oil is fed to the motor by a reliable automatic throttle control oiler, or left side hand pump, both of which have been redesigned and made simpler and more serviceable in every way.

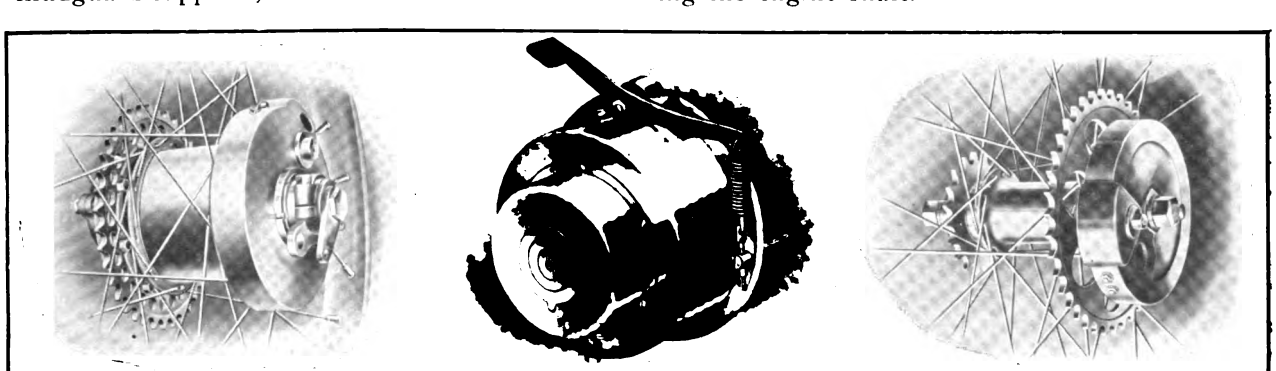


Twice as many forgings are used in the frame as formerly. This gives a much stronger assembly, although as a matter of fact the Flying Merkel never experienced any trouble from broken frames. The forks are wider and permit the use of three-inch tires with chains, both front and rear. Mudguards are of special manufacture, being of much stronger material, with beaded edges, and 4.5 inches wide. The rear forks are one inch in diameter, instead of .875 inch as was the case last year.

In the spring frame one large spring is used instead of two, as formerly. This is adjustable for different weights of riders. The new design permits of a very low saddle position and makes for greater comfort. The Merkel patented shock

Flying Merkel Model 71, the Seven Horsepower Chain Drive Twin.

Digitized by Google



Flying Merkel Model 75, the Self-Starting, Two-Speed Twin.

absorber is still a part of the hinge joint and is made more substantial than before, containing a much larger grease cup than with the 1912 mount. The rear fork ends are much heavier and have positive adjustment for chain tension. The rear wheels can be removed without loosening the mudguard or letting the air out of the tire. A notable feature is that this wheel may be dropped out of the frame without changing any of the adjustments.

The handle bar control has been changed so that a new wire can be put in by simply taking out one small screw. The wire is much heavier and does not run through the fork stem as previously. A very neat and efficient lamp bracket becomes a part of the triple clamp. The sliding parts of the spring frame and spring fork have neat leather jackets, which keep out all dust and grit. The luggage carrier, which comes without extra charge on all models, is made from .5-inch seamless steel tubing and is mounted on the rear mudguard supports, which also are of .5-inch tubing. Supported on the rear end of the luggage carrier is a very neat model tool box, enamelled to match the machine and fitted with a burglar proof lock.

The new Merkel band brake is similar to the former member in outward appearance, but is materially changed inside. It is a one-inch flat band and the mechanism is so arranged that contraction takes place gradually. The two-speed gear is located in the rear hub, becoming a part thereof, and is what is commonly known as the sun and planet type. Gears always are in mesh, preventing any possibility of stripping the teeth. They are designed so as to be practically noiseless in action and give a reduction of 1.5 to one. The control is by lever at the side of the tank, which when pulled toward the rider engages the low speed. When pushed forward the high speed and clutch are engaged, and when midway, the rear wheel is free.

The self-starter is operated by large coil springs, and is of a type which has proved successful on automobiles. It will turn the engine eight times when the small pedal is pushed, and after the motor is started the first 26 turns rewind the starter and automatically force it out of engagement. The starter is mounted on the left side and becomes a part of the crankcase, turning the engine shaft.

Some Special Features of the 1913 Flying Merkel Mounts: At Left, Two-Speed Gear in Centre, Self-Starting Mechanism; at Right, New Band Brake.

Digitized by Google

In regard to the equipment, a wide choice is permitted. Federal, Goodyear or United States tires are offered, 3.5-inch tires being fitted to single-cylinder machines and 2.75-inch on twins. Persons' Champion, Troxel or Mesinger Superba saddles are optional.

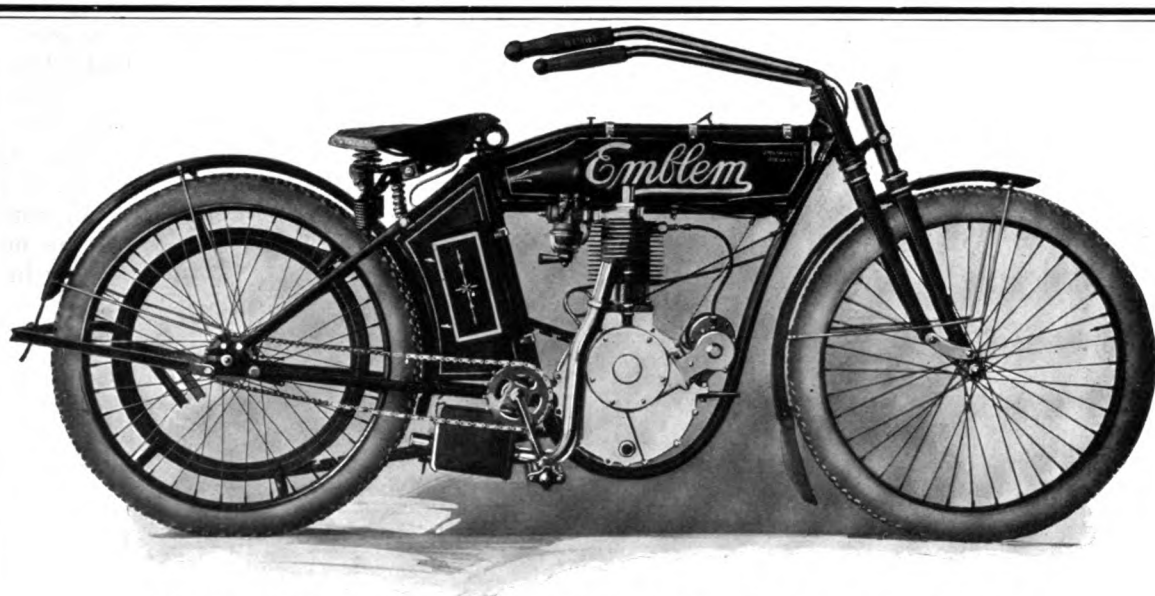
In connection with this announcement the company is offering a prize of $100 in gold to the person who submits the most suitable name for the new models 45 and 75, these being the mounts which are fitted with the new self-starter. They are considered by the company to be the most wonderful motorcycles ever presented to the public, and the award is offered for the purpose of making them justly famous the world over.

New Orleans Buys Indians.

The city of New Orleans, La., has put into service four Indian motorcycles for its motorcycle squad. Before the Indian machines were accepted by Superintendent of Police Reynolds, they were subjected to a strenuous test against a fast motor car on the West End speedway. Allowing the car a start of 300 feet the motorcycles caught the fast moving machine in a little more than a mile and duplicated the feat over the reverse course.

Fred T. Kerr, London, Ont., and Emblem Mount with Which He Has Won Many Races.

Wins Every Race but One.



An accompanying illustration presents Fred T. Kerr of London, Ont., agent for Emblem mounts, made by the Emblem Manufacturing Company, Angola, N. Y. When he isn't busy selling, he takes advantage of the opportunity to demonstrate the value of the Emblem as a racing machine. During the past season he entered 13 races, in which he finished in first place four times, second five and third three. In the other event he rode a single-cylinder machine in a competition for twins and did not finish with place as a result. As an indication of the speed possibilities of the Emblem it is worthy of note that with his four horsepower stock engine he was able to cover miles on a half-mile track in 1:16.

F. A. M. Directors Meet.

A special meeting of the board of directors of the Federation of American Motorcyclists was held at St. Louis, Mo., and seven directors attended. President Patterson presided and Director Sauer acted as secretary pro tem. Others present were Directors Willis, Hamilton, Thornley, French and Johnson. Willis held Estabrook's proxy and Thornley that of Collins. The board voted, upon motion of Mr. Hamilton, to give the chairman of the membership committee a salary of $1040 a year in addition to expenses for printing and postage. The salary of Chairman Thornley of the competition committee was made $25 a week, contingent upon the amount being taken from sanction fees; allowance for stenographic service, not more than $20 a week; for rent, heat, light, etc., $15 a week. T. J. Sullivan, sent to St. Louis by a Chicago trade journal to indorse its attitude towards Mr. Thornley, was given a hearing. Mr. Sullivan brought no charges, but in the end the board disapproved the personalities on both sides and also of the so-called Mann letter over which the controversy started. Chairman Thornley was instructed to turn over to the national treasurer the first of each month all funds in excess of a working bank balance of $500. Chairman Sauer of the legal action committee was directed to arrange a working alliance with the English A. C. U., through Mr. Wells of London, recently delegated by President Patterson to represent the F. A. M. in England. The charges against Referee Hallman of the St. Louis motordrome were dismissed. Secretary-Treasurer Gibson was elected secretary ex-officio of the board.

Relative to the notice issued by Chairman Thornley that J. U. Constant of Brooklyn, N. Y., had been declared a professional for riding in a trade rider event at Toronto, Can., while still connected with the trade, at a meet where the public was charged admission, Constant entered a dignified appeal. He claimed that as the Canadian Motorcyclists' Association is still working under the old three-class rule, its new rules not going into effect until Jan. 1, 1913, he should not

ANGOLA ERIE COUNTY NEW YORK

be considered a professional, inasmuch as he had a right to ride as an amateur trade rider in a race recognized as amateur in Canada without infringing upon his standing in this country. Constant was restored to his status as an amateur and the policy of the F. A. M. was defined. Under the agreement, Canadian riders competing in this country will be considered amateurs if they are such under Canadian rules and vice versa. However, after Jan. 1 the competition rules of both bodies will conform to a uniform scale.

Minneapolis Company in New Hands.

The stockholders of the Minneapolis Motorcycle Company, Minneapolis, Minn., maker of the Minneapolis motorcycle, have voted to accept the proposition of a syndicate composed of some of the most influential financial and industrial business men of the northwest to purchase the business of the company outright. The new company, to be known as the Minneapolis Motor Company, is incorporated for $500,000, and is making the necessary changes looking toward the manufacture of motorcycles in large numbers. The name of the machine will not be changed. J. M. Starnes, vice president of the American Timber Holding Company, is president of the new company; F. E. Kenaston, president of the Minneapolis Threshing Machine Company, is vice president; F. E. Starnes is secretary and treasurer and will have the general management of the concern. J. M. Michaelson, orginator of the Minneapolis two-speed, is chief engineer.

Touring Across Canadian Border.

The Canadian Motorcyclists' Association has begun an attempt to reduce the restrictions governing touring across the United States-Canadian boundary line in either direction. A bill has been prepared for introduction into the Canadian

Chain Driven 5-6 Horsepower Yale Single for the 1913 Season.

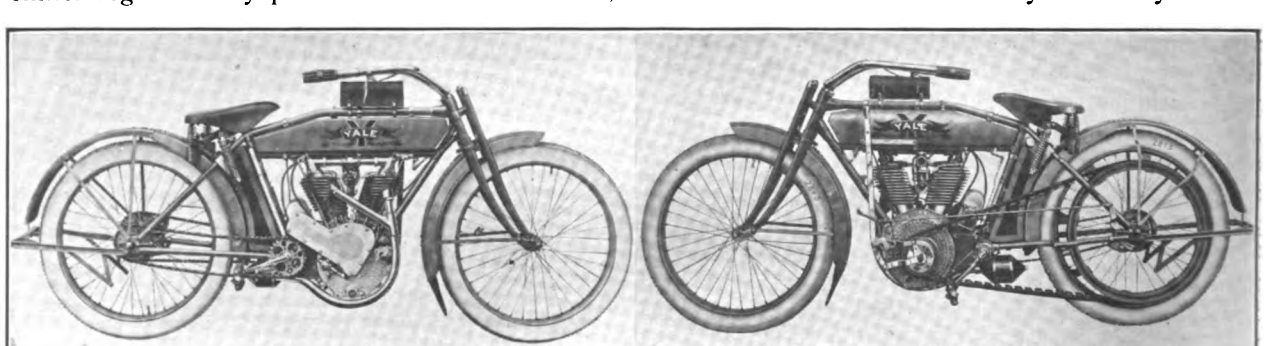
Parliament. The legal action committee of the F. A. M. also will take action and do its share to accomplish equal results by taking the matter up with the United States authorities.

New Registered Repair Shops.

Repair shops registered with Secretary Gibson of the F. A. M. are as follows: Gartin Cycle & Auto Company, Third and Ruby streets, Ellensburg, Wash.; Best Motor & Cycle Company, 37 West Jefferson street, Phoenix, Ariz.; Walthour Motorcycle Company, Inc., 1714 Third avenue, Birmingham, Ala.; Motorcycle Equipment & Repair Company, 727 Common street, New Orleans, La.

Motorcycles in Philippines.

The assembly of the Philippine Islands has enacted a registration law for motorcycles and automobiles and the charge is now $2.50 for two-wheeled mounts. The government has published a list of the mounts registered under the new law and it is shown there are 287 machines owned in the islands. Of these 204 are Indian, 51 F. N., seven Pierce, four Humber, three each Pope and Singer; two each Harley-Davidson, Minneapolis, M-M and R-S, and one each Condon, Emblem, Merkel, N. S. U. and Thor. The machines registered by private owners number 149, the remainder being owned by the different insular government bureaus, provincial governments, Manila police and the United States government, war department.



Two Yale Mounts for 1913.

The product of the Consolidated Manufacturing Company, Toledo, O., maker of Yale mounts, for the 1913 season, will be confined to two models—a 5-6 horsepower single and a 7-8 horsepower twin. Both of these will be offered with option of either chain or belt drive.

The single-cylinder machine is an entirely new production, taking the place of the old four horsepower single. It has a big, long stroke motor, with a mechanical inlet valve, and the transmission is either flat belt or chain, with the Eclipse free engine clutch as regular equipment. Regulation of belt tension and clutch engagement is separate, so that the two can be adjusted independently.

The motor of the twin has cooling flanges of the same horizontal pattern that distinguished the 1912 Yale twin. This is held to permit a perfect circulation of air over the surfaces of both front and rear cylinders and to insure efficient cooling. Transmission is by V belt or chain, it being contended that no flat belt would hold the power developed by this motor.

Particular attention has been paid to the proportioning of all parts and it is maintained that each is designed to have the correct dimensions. All reciprocating parts are so balanced as to move with no vibration. The weight of the pistons, connecting rods and pins is in such relation to that of the flywheel that the piston is held to reach the end of its stroke without shock, and the motor is said to run very smoothly. The

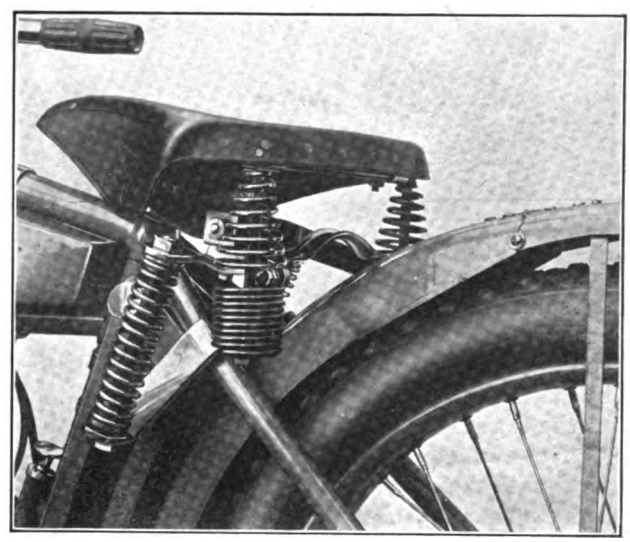
The 7-8 Horsepower Yale Twin for 1913: At Left, the Chain Driven Model; at Right, with V Belt Transmission.

Digitized by Google

same accuracy applies to the gas passages, the intake pipe of .75 inch diameter being considered the proper proportion to the bore and stroke.

Lubrication is by a new mechanical oil pump of the plunger type, driven by a worm gear. Provision is made for adjustment as required, and an auxiliary hand pump may be used in case of emergency or for racing. An oil glass in the motor base supplies the necessary sight gauge. The carburetor is of the Heitger make, specially adapted to meet the needs of Yale motors. Ignition is by a Bosch magneto of the enclosed water proof type, set behind the cylinder where it is well protected. The helical gears of the magneto train are of nickel steel, with .375-inch face.

The frame lines of the new Yales are distinctive and give a much more racy appearance to the machines. The top frame bar is dropped at the rear to give a very low saddle position, and the shape of the tank also has been changed. The finish will be in gray with blue striping and a blue panel in the sides of the oil tank. This tank is separate from that which holds the fuel, the latter now being built in front of the seat mast tube. Provision is made for carrying three gallons of gasoline and a gallon of lubricant.



An important feature is the tire equipment, which is of the three-inch size. Additional clearance between the tires and the guards and fork sides permits the use of chains if desired. The rear mudguard is a new idea for motorcycles, as it is hinged so that it can be swung upward out of the way when it becomes necessary to remove the rear wheel.

Footrests ahead of the motor base allow a change of riding position on long trips and greatly increase the comfort. A foot lever on the left rest provides for brake operation. An option is permitted between the Corbin band brake and the new Eclipse multiple-disc member. There is a new muffler this year, this being located back of the motor with the exhaust pipes coming to it in a graceful sweep. Although provided with a cut-out, it is pointed out by the maker that very little is to be gained by its use, since the muffler produces no perceptible back pressure.

The success attending the front fork design for 1912 has been such that it has been deemed wise to continue it for next season. The rear wheel shocks are taken care of as before by the Y-A shock absorber. This is constructed on the theory that if one spring, as in an ordinary spring seat post, is good, two must be better. It is maintained that by its use all side play is eliminated, making the machine much easier to handle.

Has 19,000 Members Now.

The growth of the Federation of American Motorcyclists has been such the past two years that it is hoped by another year to have 30,000 names enrolled. Today the F. A. M. has 19,000 members, the honor of securing membership card No. 19,000 going to Buenaventura Carbo, American vice and deputy consul at Cienfuegos, Cuba. In October, 1910, the federation had 5000 members, showing a gain of 14,000 in the two years.

freight house at Landisville, N. J., of an Emblem motorcycle, No. 7335, and requests dealers and repairmen, especially in adjacent territory, to keep a watch for the stolen machine.

The M. & M. Economizer.

A new device, designed to admit auxiliary air between the carburetor and the cylinder, has been placed in the market by the Moller Bros. Controller & Economizer Company, 700 Betz building, Philadelphia. This is the M. & M. economizer, and it is new only because it is especially adapted for motorcycle use. A device of the same nature has been offered by this company for automobiles for some three years.

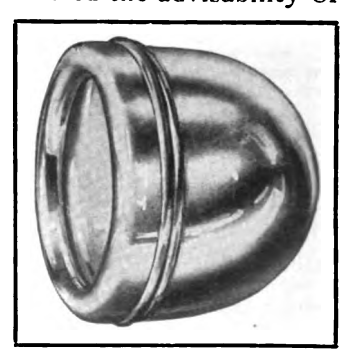
M. & M. Economizer.

The economizer is nickel plated, highly polished, and is made with one ground valve seat and six port holes. By its use it is maintained that the gas coming from the carburetor is broken up and sprayed by the incoming air, the amount of which is controlled by hand, and the fuel thus reaches the cylinder in the highest explosive condition.

Not only does the maker claim that the device will increase speed and power, thereby bringing about a decided saving in gasoline and a diminution of carbon, but that it will act as a safety valve in case of back fire, can be used for priming the engine, and may be utilized instead of the clutch in descending grades, turning corners and slowing up for crossings. To attach, a .45-inch standard pipe is required, and it is said to be absolutely air tight.

Pierce Buys Pierce Company.

The Pierce Cycle Company, Buffalo, N. Y., maker of the Pierce motorcycle, which was recently purchased at public sale by a syndicate of New York capitalists, consisting of Joseph Frankel, Theodore Friedenburg, William Wooster and R. J. Metzler, has been disposed of by these men, the purchaser being Percy P. Pierce, son of the late George N. Pierce, founder of the concern in 1865.



The New York men purchased the plant for $70,650 and it was said that they intended to operate it on a large scale. Arrangements for department heads of experience were announced and although it had been rumored that the syndicate might sell the plant, the sale to Mr. Pierce came somewhat as a surprise. The consideration of the sale is not divulged, but Mr. Pierce intends to continue the plant and manufacture Pierce motorcycles on a larger scale than heretofore, maintaining the high standard of the past. W. A. Johnson, who proved an efficient sales manager under the recent trusteeship while the concern was in bankruptcy, will continue to fill that position.

New Merkel Agencies.

Among the new agencies for Flying Merkel motorcycles recently closed by the Miami Cycle & Manufacturing Company, Middletown, O., maker of the machines, were the following: The Edwards Cycle Company, Minneapolis, Minn.; Dominion Cycle Company, Manitoba, Can.; Western Cycle & Motor Company, Saskatchewan, Can.; Nebraska Cycle Company, Omaha, Neb.; F. B. Widmayer Company, New York City; Norman E. Heil, Paterson, N. J.; W. J. Callwell, Newburg, N. Y.; Utica Cycle Company, Utica, N. Y.; W. A. Doubleday Company, Syracuse, N. Y.; Neff & Malone, Rochester, N. Y.; F. N. Coleman, Springfield, Mass.; Stebbins & Geynet, Norwich, Conn.; W. T. Hayes, Hartford, Conn.; Fred Huyck, Chicago; Filfillan Bros., Kewanee, Ill.; Koch Outfitting Company, Evansville, Ind.; Paul W. Smith, Iowa City, Ia.; Benton & Ives, Kiowa, Kan.; H. A. Avery, Wakefield, Kan.; H. W. Justus, Naponach, N. Y.; John Seaton, Hamburg, N. Y.; John Pflieger, Brooklyn, N. Y.; Knupp Bros. Garage, Sidney, O.; The Hayes House Furnishing Company, Erie, Penn.; Harry L. Neff, Pittsburg, Penn.; Thomas Tauber, McKeesport, Penn.; Bloxom Bros., Mappsville, Va.

Electric Motorcycle Lamp.

Every rider has considered the advisability of securing an electric headlight, but there is no desire to add weight to the equipment of the machine. It follows that there will be undoubted interest in the announcement of the Indiana Lamp Company, Connersville, Ind., that it is ready to place in the market a new bullet type electric motorcycle lamp. An accompanying illustration shows the design, and it is stated that it weighs only about one pound. It is claimed by the maker that it may be operated successfully by three dry cells carried in the tool box of the machine.

Electric Headlight Produced by Indiana Lamp Company.

The following concerns have been incorporated recently to manufacture and deal in motor cars, accessories, etc.:

Star Motor Car Company, Augusta, Me.; $500,000; to deal in automobiles; president, N. L. Goodall; treasurer, W. N. Sanborn.

LaFayette Motor Sales Company, Inc., Buffalo, N. Y.; $10,000; incorporators, Annie E. Groh, Frank J. Batt, Joseph A. Groh.

General Rim Company, White Plains, N. Y.; $150,000; to deal in motor vehicles and parts; incorporators, Robert W. Ashley, Frank Oberkirch, William Kaul.

Never Skid Manufacturing Company, Inc., New York City; $50,000; to manufacture devices to prevent skidding of motor vehicles; incorporators, Daniel E. Wing, George L. Lewis, Charles T. Stanton.

Maine Power Truck Company, Portland, Me.; $10,000; general garage business; president, Irving L. Peabody; treasurer, George E. Peabody.

Joliet Auto Supply Company, Joliet, Ill.; $5000; incorporators, Ben S. Moore, Thomas J. Bracker, John H. Garnsey.

Atlas Tire Company, Inc., 1771 Broadway, New York City; $10,000; automobile tires; incorporators, Ralph W. Morrison, R. D. Placak, F. F. Nichols.

American Auto Radiator Works, Newark, N. J.; $25,000; to manufacture radiators, automobiles, auto trucks, etc.; incorporators, Max Steiner, S. Goldstein, A. Marcus.

City Automobile Company, Morgantown, W. Va.; $4800; to manufacture, buy and sell automobile supplies, operate garage; incorporators, J. Leonard Yates, B. S. Dearing, N. B. Yost, Margaret Smith, Cora B. Dearing.

Motor Supplies Company, Chicago; $5000; manufacturing and dealing in automobiles, automobile parts and supplies; incorporators, H. C. Malbolm, P. W. Gillett, E. M. Beauchamp.

Blue Ridge Motor Company, Waynesville, N. C.; $25,000; incorporators, G. H. Paddock, James Atkins, Jr., H. Rotha.

The Nyack Garage, Inc., Nyack, N. Y.; $15,000; to deal in automobiles, etc.; incorporators, Paul J. DuBoise and others.

Perfection Automobile Supply Company, New York City; $15,000; to manufacture automobile parts, deal in automobiles, etc.; incorporators, James V. Simpson and others.

Tibbetts & Co., Trenton, N. J.; $10,000; general automobile and motorcycle business; incorporators, George Tunnicliffe, E. Knapp, Joseph Tibbetts.

Distributing & Importing Company, New York City; $100,000; automobiles, motor vehicles and biplanes; incorporators, Paul Lacroix, Harvey T. Andrews, Henry A. Miller.

De Lion Tire & Rubber Company, Jersey City, N. J.; $500,000; general automobile business and manufacturing rubber goods; incorporators, H. O. Coughlan, T. K. Mallaby, H. T. Letts.

Commercial Garage Company, Newark, N. J.; $10,000; general automobile business; incorporators, L. Kirkpatrick, R. O'Gorman, S. A. Young.

Nyberg Automobile Company of New Jersey, Newark, N. J.; $25,000; general automobile business; incorporators, C. Hallock, F. F. Moore, A. E. Hartcorn.

Sternberg Motor Truck Company, New York City; $25,000; incorporators, Bruno Sternberg, Eugene P. Harrman, Ernest M. Sternberg.

Amherst Garage Company, Amherst, Mass.; $15,000; incorporators, H. E. Paige, Louis E. Smith, C. H. Buell.

National Automobile Owners' Association, Asbury Park, N. J.; $25,000; automobile business; incorporators, A. M. Hushart, W. F. Paterson, D. W. Edwards.

GARAGE AND DEALER.

The Lozier Sales Company, with capital of $50,000 subscribed by prominent men in Akron, O., has been organized in Cleveland, O., to take over the business of the factory branch formerly conducted in that city by the Lozier Motor Company, Detroit, maker of Lozier cars. A. W. Woodruff has been appointed manager. The salesroom is located at 2336 Euclid avenue.

The Lambert Auto Company, Baltimore, Md., has been appointed agent for the Church-Field electric pleasure cars, made by the Church-Field Motor Company, Sibley, Mich.

G. F. Green, Brewster, Wash., has taken the agency for the Ford car, made by the Ford Motor Company, Detroit, and will establish a garage in that city.

The General Motor Car Company, Philadelphia, Penn., agent for Lozier, Paige-Detroit and Rauch & Lang electrics, has leased premises at 21st and Ludlow streets, containing 52,000 square feet of floor space for salesrooms, repair, paint and body shops. After an expenditure of $40,000 to adapt the building to its uses, the company will occupy it in the near future. Until that time it will be in its old quarters at 227-229 North Broad street.

The Meriden Auto Service Company, Meriden, Conn., has been formed to buy and sell automobiles and motor trucks, with offices at 35 State street. The officers of the company are: President, Dr. H. L. Patzold; secretary, Paul C. Booth; treasurer, William H. Cumberidge.

James S. Butler is occupying his new garage, which has just been completed on New Derby street, Salem, Mass. The structure is held to be absolutely fireproof.

The S. L. Crosby Company, Bangor, Me., has moved into its new fireproof garage on Salem court. The firm now has one of the largest workshops devoted to automobile repairing in Maine. The company has the agency in eastern Maine for the Ford car, made by the Ford Motor Company, Detroit.

The Kansas City Automobile Supply Company, 1504 Grand avenue, Kansas City, Mo., has purchased of J. C. Gates 49.5 feet of land on McGee street between 18th and 19th streets, at a cost of $25,000. The company will erect a four-story building on the site, to cost $40,000.

F. J. Tyler of the Tyler Bros. Corporation, Boston, has announced the establishment of a factory branch to handle in New England the products of the Little Motor Car Company and the Chevrolet Motor Company, both of Flint, Mich., and both controlled by the Republic Motor Company, Detroit. The branch will be conducted under the style of Republic Motor Company of Massachusetts and will be under the management of W. C. Sills, who has been assistant manager of the Buick Boston Motor Company for the past three years.

The Van Vliet-Bradt Motor Company, Des Moines, Ia., has been incorporated with a capital of $10,000 and quarters have been secured at 919 West Locust street. The officers of the new company are: President, W. E. Moyer; vice president, W. J. Bradt; secretary and treasurer, C. G. Van Vliet.

The Reliance Automobile Company, San Francisco,

Digitized by Google

Cal., has secured new headquarters at 1655 Van Ness avenue, formerly occupied by the Stearns Company. The building will be remodelled and Knox pleasure cars and Detroit electrics will be handled. The salesroom for the Knox trucks and the repair and service departments will be at the company's machine shops, 547-557 Fulton street, which will be in telephonic communication with the headquarters on Van Ness avenue.

The Southern Motors Company, Louisville, Ky., has taken over the garage of the Miles Auto Company, 615 South Third street. The Packard cars, formerly handled by the Miles company, will now be distributed by the Southern Motors Company, which also distributes Hudson cars, made by the Hudson Motor Car Company, Detroit.

The Tudor Garage on Washington avenue, Chelsea, Mass., has been purchased by L. and S. Gale of Everett, Mass., and business will be conducted under the firm name of L. Gale & Son. Harry Snowman will be retained as assistant manager. Samuel Gale will be manager and treasurer.

George Figel, who has temporary quarters on University avenue, San Diego, Cal., has secured a lease of a new garage which will be erected at City Heights at a cost of $10,000, by S. M. Toole, capitalist. The building will contain all the modern apparatus for repair work.

J. S. Morrison is manager of the new agency at Phoenix, Ariz., which will distribute the Hupmobile, made by the Hupp Motor Car Company, Detroit, in Arizona and New Mexico. The distributing agency does not conflict with the retail agency conducted at Phoenix by

Springfield, Mass., having formed a company to handle the Rambler, Little and Chevrolet cars. Plans are being made for doing an extensive business.

The Cole Motor Car Company, local branch, Indianapolis, Ind., has completed the equipment of its new service station at 524 North Capitol avenue. It occupies two floors of one of the handsome concrete showrooms which form Automobile row in Indianapolis. One unique feature is a bell on the outside of the building by which the passing motorist can summon the foreman without delay.

The Isotta Fraschini Motors Company, New York City, is now in its new quarters at 1920 Broadway. The change in location was due to the fact that the company had outgrown its old quarters. A service station, with a full and complete stock of parts has been established on the third floor and excellent service will be given to owners of Isotta cars.

The Thomas B. Jeffery Company of California, San Francisco, Cal., has moved into its new three-story building on 12th street near Market street, where more than 30,000 square feet of floor space will be devoted to the care and sale of Rambler cars, made by the Thomas B. Jeffery Company, Kenosha, Wis. The lower floor cares for the general offices, the display room, parts department and space to make minor repairs and adjustments. The second floor will be given over to the storage of new cars and the top floor will be devoted to the machine shops and general repair work. No delay will be encountered in any department of the firm, which now enjoys as good facilities as any on the Pacific Coast.

A Few of the 410 Members of the Cleveland Chamber of Commerce Visiting the Plant of the B. F. Goodrich Company, Akron, O.

John A. McCondra and L. E. Hoeye, with offices at First and Monroe streets.

The Stewart-Borcher Auto Repair Company, Waterloo, Ia., has located a first class repair shop at 219 East Sixth street, where repairs to all makes of cars will be undertaken. A complete line of supplies is to be kept in stock and the company intends to add a new automobile to its line in the spring.

The Blackhawk Auto Company, Waterloo, Ia., will move to larger and more modern quarters in the near future.

The Barr-Morgan Auto Company, Sioux City, Ia., has located at 525 Sixth street and will handle the Cole machines, made by the Cole Motor Car Company, Indianapolis, Ind.

J. W. Mooman has sold his interest in the Urbana Auto Company, Urbana, Ill., to his partner, John F. Miller. F. L. Cannon is manager.

The Iowa Auto & Tire Company, Davenport, Ia., has been reorganized and will be known in future as the Iowa Taxicab Company. It is located at 112 Commercial alley and has the agency for the Pierce-Arrow cars, made by the Pierce-Arrow Motor Car Company, Buffalo, N. Y.

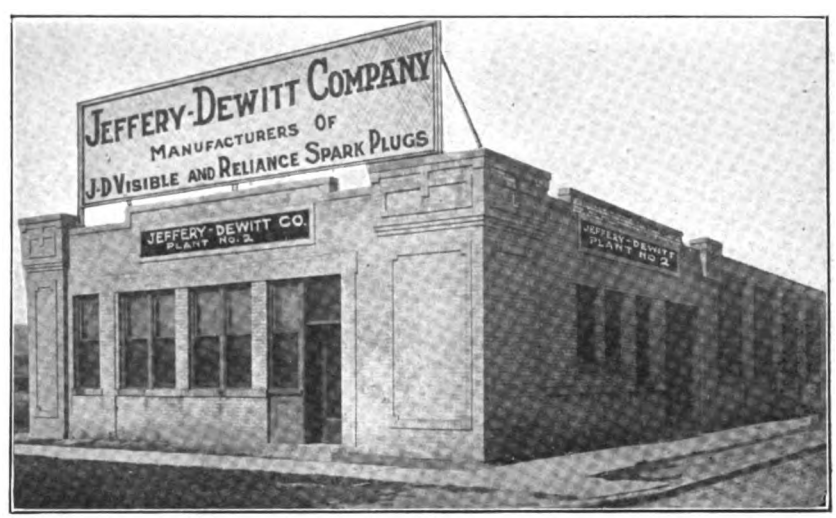
W. L. Bunker and A. V. Reopell, well known in automobile circles, have opened salesrooms on Fort street,

Charles Wedding, Jerseyville, Ill., has purchased the interest of his partner, Clarence Heidscheid, in the firm of Wedding & Heidscheid, and will continue the business alone.

WITH THE MANUFACTURERS.

The B. F. Goodrich Company, Akron, O., maker of Goodrich tires, recently entertained 410 members of the Chamber of Commerce, Cleveland, O., at its factory. The task of meeting and arranging these guests so that each should obtain accurate information concerning the various departments of the plant, which affords 65 acres of floor space, was carried out successfully. An accompanying illustration shows a portion of the party about to enter one of the buildings.

The Knight Tire & Rubber Company, Canton, O., maker of Knight tires, has opened a branch office at 221 Peachtree street, Atlanta, Ga., under the management of H. C. Ross, for the past seven years connected with the Diamond Rubber Company's interests in the South. The branch will be the general distributing point for six or seven states surrounding Georgia.



The Marshalltown Motor Material Manufacturing Company, Inc., Marshalltown, Ia., or as it is generally known, the M. M. M. M. Company, Inc., has filed with the

Digitized by Google

secretary of state a revision of the corporate name and will be known in the future as the V-Ray Company, Inc. The company produces the V-Ray spark plug and is enlarging its facilities anticipating a five-fold increase in output for the next year. The product will be displayed at booth 629 at the Madison Square Garden show in New York City, and booth 31 in the Chicago exhibition.

The Jeffery-Dewitt Company, Detroit, maker of Reliance and the new J-D Visible spark plugs, has been forced by increasing business to occupy another building, affording 6000 square feet of floor space, in addition to its original quarters. This is shown herewith and will be known as plant No. 2. It is located on the East Grand boulevard, and from this point the entire assembling and shipping will be carried on. The old factory, which will be known as plant No. 1, will be devoted solely to the manufacturing of porcelains and the machining of metal parts.

The R-C-H Corporation, Detroit, maker of R-C-H cars, has signed the following 1913 contracts: Rudolph Dittmar, Massbach, Ill.; Perry & Westin, Newberry, Mich.; Barry Garage, Chicago; W. W. Calhoun, Fort Gaines, Ga.; K. W. Detwiller, Palmerton, Penn.; Max Wolcott Garage, Corning, N. Y.; A. S. Baker & Son, Stratton, Col.; Newton Root, Kalamazoo, Mich.; Grant S. Emery, Jonesville, Mich.; A. H. Hancuff and W. Shelly, Williamsburg, Penn.; P. E. Weimer, Rockwood, Penn.; The Corn Belt Auto Company, Waterloo, Ia.; Davis & Turney Company, Dallas, Tex.; Ernest C. Currier, Ipswich, Mass.; W. H. Carll & Sons, Rochester, N. H.; William G. Dupont, Berlin, N. H.; E. J. Weese, Ipava, Ill.; Terre Haute Machine Works, Terre Haute, Ind.; George McDonald, Akron, Col.; Ray Danner, Loveland, Col.; Fancher Bros., Evanston, Ill.; Shean Auto Station, Springfield, Mass.; W. D. Havens, Schenectady, N. Y.; A. H. Wilson Motor Car Company, Canton, O.; K. A. Knudson, Delhi, Minn.; W. F. Schroeder, Danube, Minn.; Martin Rimestad, Olsen, N. D.; Lon Sellars, Amarillo, Tex.; Walter-Hafner Jewelry Company, Hillsboro, Tex.; G. R. Daniels, Olean, N. Y.; B. D. Smith, Odell, Tex.; J. N. Ginter, Wooster, O.; Beyer & Feakes, Hackensack, N. J.; Karlson's Garage, Hicksville, N. Y.; W. S. Lawrence, Moira, N. Y.; Julius Lichtenstein, New York City; N. C. Doering, Gaylord, Minn.; R. J. Orchard, Garske, N. D.; J. B. Siegfried, Canbridge, O.; George D. Woods, Mancos, Col.; Elm City Publishing Company, Waterville, Me.; Kansas Motor Car Company, Wichita, Kan.; Dupont Motor Company, Washington, D. C.; Westcott Motor Car Company, Little Rock, Ark.; Modern Garage, Jacksonville, Ill.

New Factory of Jeffery-Dewitt Company, Detroit, Known as Plant No. 2.

John G. Perrin, chief engineer of the Lozier Motor Company, Detroit, maker of Lozier cars, who was recently elected vice president of the Society of Automobile Engineers, has gone to Europe to study the trend of design of the foreign motor car industry and to compare the progress made by foreign manufacturers with that of the makers in this country He will visit many of the best English factories.

Morton H. Luce, who has been associated with the Velie interests in the Boston and Chicago branches for the past four years, has resigned to accept a position with the Marion Motor Car Company, Indianapolis, Ind., maker of Marion cars. He will be located in New York City, taking charge of the eastern district.

The Luverne Automobile Company, Luverne, Minn., has added a four-cylinder, 40 horsepower car to its line of six-cylinder pleasure machines. The company sells direct from the factory only.

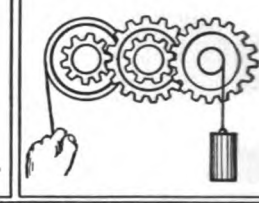
The Parker Motor Company, Detroit, Mich., has been formed to manufacture a rotary valve motor and temporary quarters have been established at 660 Grand River avenue. V. C. Parker, formerly of Winnipeg, Can., is the manager.

The Universal Wheel Company, Fort Wayne, Ind., with a capital stock of $1,000,000, will establish a large factory in that city for the manufacture of puncture proof automobile wheels. Temporary quarters have been secured on Pearl street.

The Fisher Auto Top Company, Norwalk, O., manufacturer of automobile tops, has extended its factory facilities and in addition to its quarters on West Seminary street has occupied space in the Hull building on Hester street.

The Motor & Accessory Manufacturers' Association has elected the following concerns to membership: John W. Blackledge Manufacturing Company, maker of auxiliary springs and shackles and automobile accessories, 2210 Michigan avenue, Chicago; James L. Gibney Rubber Company, rubber tires, rubber goods and vulcanizers, 215-217 North Broad street, Philadelphia, Penn.; Westinghouse Electric and Manufacturing Company, electric vehicle motors, ignition and lighting systems, East Pittsburg, Penn.

William H. Hotchkiss of Buffalo, N. Y., formerly a member of the American Automobile Association and also state superintendent of insurance of New York State at one time, has been elected president of the twin automobile insurance companies, known as the National Motor Indemnity Company and the National Motor Insurance Company of New York City.



The Cole Motor Car Company, Indianapolis, Ind., has appointed the following agents for 1913: F. W. Davis & Sons, Fall River, Mass.; Palace Auto Station, Worcester, Mass.; Pawtucket Auto Company, Providence, R. I.; Anderson Automobile Company, Anderson, Ind.; W. H. Dykeman, Bayonne, N. J.; Hager Bros., Baxter, Ia.; A. H. Krauss & Co., Blue Springs, Neb.; Churchill & Lockwood, Burlington, Vt.; J. R. King, Charleston, W. Va.; Kehay L. Hosmer & Co., Cairo, Ill.; E. J. Quigley, Canton, O.; Guy Coleman, Canton, Ill.; Ostrand & Lampert, Cedar Bluffs, Neb.; D. Scott Thompson, Clarksburg, W. Va.; W. E. Campbell, Clarksdale, Miss.; Covington & Smith, Clio, S. C.; A. J. Dischner, Columbus, Neb.; Franklin Cycle & Supply Company, Columbus, O.; Letts Farrell Company, Cortland, N. Y.; Boehmer & Sheridan, Fort Smith, Ark.; J. R. Kiser, Fremont, O.; W. S. Wright, Greenwood, Miss.; B. L. Lyford, Helena, Ark.; Townsend & King, Itta Bena, Miss.; L. F. Weathersby, Jonestown, Miss.; Craven & Moberly Company, Kellogg, Ia.; L. L. Sybee & Co., Knoxville, Ia.; Alfred Lofland and C. E. Layton, Lebanon, Ind.; E. Norwuist, Lexington, Miss.; Miles Auto Company, Louisville, Ky.; Cary S. Davis, Ypsilanti, Mich.; William Hillsamer & Son, Marion, Ind.

J. C. Ayres has been appointed manager of the newly completed Detroit branch of the General Motors Company at Fort street, 12th street and Lafayette boulevard. Mr. Ayres has been connected with the motor truck industry since its early inception.

The Lavigne Gear Company, Corliss, Wis., has leased the plant of the Racine Sattley Company, Racine, Wis., which recently suspended operations, and will manufacture steering gears.

RECENT MOTOR VEHICLE PATENTS

Wright Windshield.

A patent for a windshield adaptable to motorcycles or bicycles has been granted to Chauncey M. Wright, Philadelphia. It comprises two shields, so mounted as to form a triangle with the apex in the direction in which the machine is travelling. The shields are clamped to the handle bars and springs are provided as well as means for folding the shields.

Bishop Vehicle Lock.

The increasing number of thefts of motor cars has been productive of several patented devices to prevent use of the machine by others than those intended. Ephriam M. Bishop, Kingston, N. Y., has applied a principle employed with horse drawn vehicles, by securing the wheels on either side with chains to prevent traction. In the Bishop device one end of the chain member is provided with a casing having a slot, also a spring member having a rigid connection with the casing. A locking head is utilized on the free end of the spring member and is adapted to be inserted through the slot. The chain encircles the felloe of the wheels, preventing their rotation.

Hevey Tire Tool.

Herman Hevey, Biddeford, Me., has been granted a patent for a tire removing tool which is constructed to exert considerable energy through a lever and fulcrum arrangement. The body portion of the device is provided with spaced arms, one of which is designed to engage with one side of the rim while the other is fitted with a casing. The arm members are adjustable and the casing member carries a vertical member which may be raised or lowered to engage with the rim. A plunger is horizontally mounted in the casing and is movable toward the first named arm. The rear of the plunger is formed with oppositely inclined faces. Energy is imparted by an actuating lever fulcrumed in the outer end of the casing and provided with a cam surface adapted to bear against the rear end of the plunger. The cam surface is notched at one end for engagement with the inclined faces of the plunger for the purpose of locking it.

Ruffier Heater.

Gaston Ruffier, New York City, has patented a device for heating the interior of the motor car by utilizing the exhaust gases of the engine. The interior of the exhaust pipe is provided with a tubing so arranged that the gases are led to a radiator member, thence to the outer air by the way of the regular exhaust pipe. The device is provided with a by-pass so that the flow of gases to the radiator may be controlled.

Alperin Tire Lock.

A device for locking the tires to the running board of the car and thereby preventing their theft, has been patented by Bernard A. Alperin, New York City. A pair of supports, each having a movable arm, are secured to the running board by means of bolts and lock nuts. The inner and outer arms are adapted to be moved to permit of fitting the tires which are retained by a chain secured to one of the movable arms. The other arm is provided with an eye member which engages with a link of the chain and means for locking are secured through a padlock or other suitable member.

Simmons Anti-Skid Device.

Turner W. Simmons, Bridgeport, Conn., assignor of one-half to William C. Bowers of the same city, has patented an anti-skidding device which combines chain or link members with flexible rubber balls. A pair of side links have eyes disposed at an angle to each other and have central enlargement at the apex of the angle. The rubber balls are provided with studs and links are utilized to connect or retain the spheres, the chains extending across the tread of the tire.

Dowell Oil Indicator.

A device for indicating the amount of lubricant in the crankcase or sump of a motor has been patented by Chester M. Dowell, Huntington, Ind. It comprises a plate having a tubular extension at one side and arranged at an acute angle, also a hollow projection on the opposite side of plate. The openings of the tubular and hollow members are in communication to form a U shaped passage. The plate has a projection on the same side with the hollow projection and

Digitized by Google

spaced therefrom. A sight tube is arranged between the projections, and a plug is threaded into the upper member and adapted to confine the sight tube which is formed with a vent opening.

OTHER PATENTS GONE TO ISSUE.

Window Cleaner, Elkana F. Cunningham, Clarksburg, W. Va. A window cleaning device including a slide and swinging bar and means for actuating the same.

Gas Lighting Device, Lucius James Bachus, Louisville, Ky. A wheel of sparking material is mounted on a clamp member in proximity to the burner and the gas is ignited by rotating the wheel.

Top Attachment, Lewis P. Halladay, Chicago. A holder for top bows comprising a slotted tube having recesses to engage the bows and means for locking same in position.

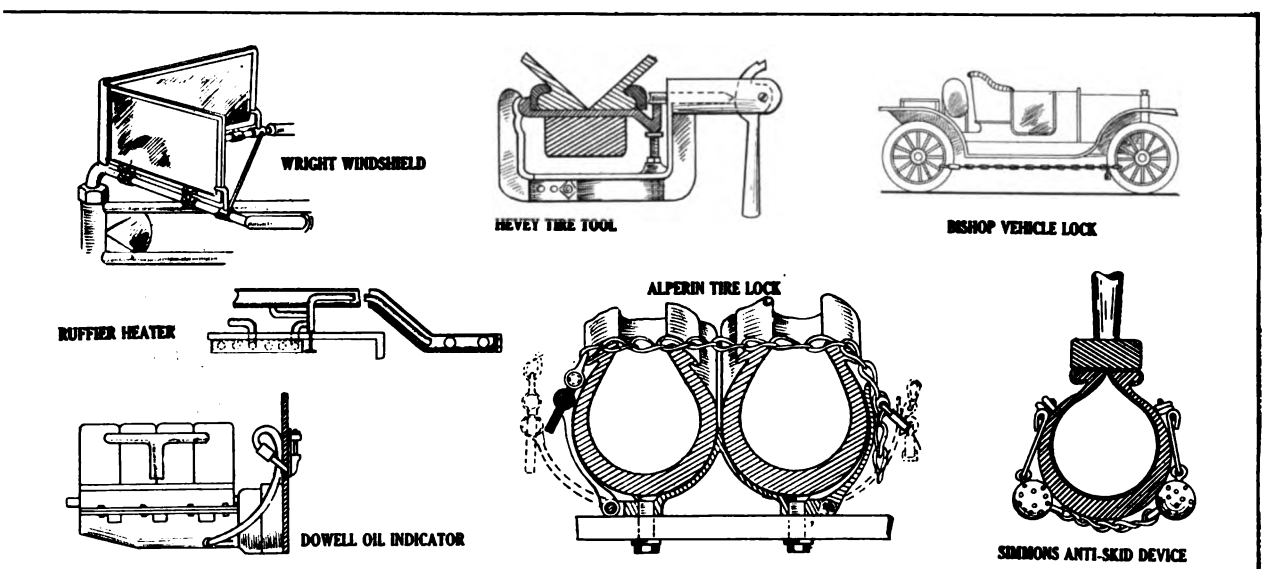
Grease Cup, Robert Hickish, Tuckahoe, N. Y. The plunger actuating the piston is provided with a ratchet stop and the base of the cup has a shut-off valve.

Spring Frame, Charles G. Stephenson, Denver, Col. A spring frame for motorcycles, two being employed, these being secured to the upper and lower part of the main frame and attached to the rear fork and frame of the wheel.

Distributor and Insulator, Ernest H. Kuntz, Arcata, Cal. A combined insulator and distributor of current comprising an internally threaded body portion, and petticoats depending therefrom, said body portion having an external thread having its ends terminating short of the ends of said body.

Motor Starter, William Emil Block, Toledo, O. The flywheel of the motor is provided with ratchet teeth meshing with similar members on a plunger and pawl mechanism which is actuated by fluid pressure.

Motor Starter, Milton E. Cole, Akron, O., assignor of one-sixth each to Charles A. Smith, Albert Burnett, Edward L. Scrote and James R. Rowlett, all of the same city. The crankshaft of the motor has rack teeth and a plunger rod having similar teeth is actuated by pressure. Means are provided for sliding the rack member on the crankshaft out of and into engagement with the plunger.



Auto-Fender, Artie L. Raven, Vista Grande, Cal. A fender for vehicles comprising a vertical screen, means for connecting same to the vehicle, and a horizontal apron pivoted to the screen member. A lifting device is incorporated in the apron and automatic means provided for moving the apron in a sweeping path to pick up objects in front of the vehicle.

Storage Battery, Orlando Oldham, Denton, near Manchester, England. A storage battery comprising a cell having a cover member, a gas collecting chamber in the latter and a tube having an exit opening in the bottom of the cell, extending to and into the collecting chamber and accessible to the gases formed within the cell.

Tire Mounting Tool, Benjamin Dahl, Minneapolis, Minn. A clamp device having a screw bolt member for attaching punctureless tires.

Tire Grip, Richard A. Breul, Bridgeport, Conn. A tire grip formed of chains, the main members being fitted in the form of a square. The traction members are attached to the main members and extend across the tread of the shoe.

Lever Locking Device, William J. Riddell, Pittsburg, Penn. The gear shift levers of the car are locked in a neutral position by means of an arm registering in slots, thereby preventing the moving of the lever member.

Showing Some of the More Recent Ideas of Inventors of Appliances Adaptable to the Motor Car, Including a Heating Device, Tire Lock, Anti-Skid Attachment, Vehicle Lock, Etc.

Shock Absorbing Device, Charles S. Moore, Danvers, Mass. The device is adaptable to springs of the elliptical design. The absorber is bow shaped, curled in the centre, and the lower portion is secured to the spring clip. The upper end is free to slide between two rollers mounted on a bracket on the underside of the top frame member.

Automobile Bumper, John and Albert Henry Hanna, Troy, N. Y., assignor to John P. Randerson, Albany, N. Y. A plate is secured to the frame of the machine and a second member is rotably attached; also an arm. Sliding connections are provided between the arm and plate and the former carries a bar. Means are provided for manually releasing the second plate as well as automatic means for locking the same when it is returned to normal engagement.

Gas Engine Attachment, Lambert J. Bordo, Hillside, Penn. A priming cup device having a valve mechanism permitting the introduction of fluids and for closing the aperture.

Throttle Controller, James J. Quigley, Mamaroneck, N. Y. A form of accelerator pedal is utilized to actuate the throttle of the carburetor and a dash pot is pivoted to a fixed support and means for pivotally connecting the piston rod of the dash pot to the accelerator member.

Digitized by Google

MILLER'S ADVANCE CATALOGUE.

Each year Chas. E. Miller, 97-103 Reade street, New York City, the pioneer jobber, manufacturer, exporter and importer of automobile accessories, prepares 100,000 copies of his annual advance catalogue for use at the shows in the various cities in which he has branches. These include 15 stores in nine different states, and the first show at which the 1913 volume was seen was at Atlanta, Ga., Nov. 16-23. Several copies will be reserved for more general distribution.

Following the example of other years the cover design includes suggestions of motoring, motorcycling, motor boating and aeroplaning, signifying that "Try Miller" is an axiom which applies to each of these fields. Another Miller slogan is presented in: "We either carry in stock, will get it—or it isn't made." The list of accessories and supplies represented in the book is much too large to permit of detailed mention. An attempt would prove little short of cataloguing the entire accessory business, at least that portion which has come to be standardized by consistent advertising. The enviable position occupied by this house since its establishment in the early days of the automobile industry, almost before there was any demand for accessories and supplies, enables it to produce a work of this nature which is particularly valuable as a reference book in buying standard articles.

AMERICAN TIRES ABROAD.

The standing which American made tires are attaining in foreign countries in competition with the product of the best European factories is strongly indicated in an announcement made by Backdahl & Co. of Stockholm, Sweden, that it has just closed a contract to supply 750 sets of United States tires, made by the United States Tire Company, New York City, for taxicab service in Norway, Sweden, Denmark and Finland. This transaction is particularly interesting in view of the fact that the price asked for American tires in Europe is considerably in advance of that charged for the native product and competition must therefore be conducted on a basis of quality, mileage and ultimate cost to consumer.

In the case of Backdahl & Co., who handle United States tires in Sweden, various tests were conducted and the contract for these 750 sets of taxicab tires awarded on results shown in actual service. Commenting on this incident and the general trend of the tire industry in foreign countries, John B. Tower, export manager of the United States Tire Company, says as follows:

"In this country tires must necessarily be constructed to meet a wide variety of road conditions, many of them extremely bad. That is why our tires show up so well in comparison when they are tested out on European highways which generally are admittedly superior to what we find at home. American made tires are gaining a firm foothold in all parts of the world. The United States Tire Company now has regularly authorized agents in Japan, the Philippines, Australia, Chile, Uruguay, Brazil, Venezuela, Panama, Costa Rica, Cuba, Porto Rico, Mexico, Finland, Norway, Denmark and Sweden, to say nothing of our big representation in Germany, France, Egypt and South Africa."

HOOPER TO RETIRE.

The 11th annual meeting of the American Automobile Association will be held at the Auditorium Hotel, Chicago, Dec. 2-3. President Robert P. Hooper declines a re-election, taking the position that it is now the duty of another automobilist of national repute to head the organization, which represents in organized form nearly 1,000,000 road users. Mr. Hooper will continue to head a Pennsylvania state organization of which he has been president since it was organized seven years ago.

The A. A. A. was organized at Chicago, March 4, 1902, and at the coming meeting a number of its organizers will be present. An effort is being made to have all the living ex-presidents present at the gathering, the list including besides Mr. Hooper and L. R. Speare, his predecessor, Dr. Julian A. Chase of Rhode Island, 1903; Elliot C. Lee of Massachusetts, 1905, and William H. Hotchkiss of New York, 1907-1908.

TOUR AROUND THE WORLD.

Melvin A. Hall and his mother, Mrs. William A. Hall, of New York City, recently arrived at San Francisco from the Orient after a trip around the world in an automobile. "We left New York 18 months ago," said Mr. Hall. With the exception of Portugal, Greece, Norway and Russia we toured every country in Europe, including the Balkan States. We tried to get to Constantinople, but there were absolutely no roads. We motored from Naples directly to the scene of the Durbar and on across India. We found fine roads in the Philippines and motored 2000 miles there. We carried camp equipment and mother slept in the car, while I slept on the ground."

NEW MORELAND DUMPING WAGON.

The Moreland Motor Truck Company, Los Angeles, Cal., has taken up the manufacture of dumping machines, and now has several in daily use in that city. Fairchilds, Gilmore & Wilton, street paving contractor, purchased the first Moreland dumping truck produced and the firm states that the machine is giving excellent satisfaction. According to actual demonstration one of these vehicles of three tons capacity will carry a four-ton load without straining the body or mechanism. Seven trips were made daily over the same course travelled by a team, which could not haul more than two tons at a time or make no more than three trips a day. Figuring the cost of operation in its business the same as for horse vehicles, Fairchilds, Gilmore & Wilton estimates that as the truck carries 4.5 times as much material, it gives four times the efficiency and really costs but one-fourth as much as teams.

OPERATING CONDITIONS ESSENTIAL.

President George A. Kissell of the Kissell Motor Car Company, maker of KisselKar trucks, says it is surprising how many ask for estimates of operating costs without givng any detail of the work in which the truck will be engaged. He adds:

"It is essential to understand where the truck is to be installed, nature of the roads as to hills and paving. Of course the daily delivery distances are necessary to learn, also the average number of stops. Then the nature of the load to be carried becomes important. These questions being answered, all help to give the manufacturer an opportunity to estimate more nearly and clearly. If comparative figures between horse and motor haulage are required, full information should be forthcoming as to the present horse haulage expense, including wages, feed, repairs, replacement and depreciation."

WEED CHAINS
PREVENT ACCIDENTS LIKE THIS

What an awful game of chance we sometimes play on the checkerboard of Life!
How narrow is Life's victory over Death at times!
What a contrast is here presented! What an object lesson this scene portrays!

Absolute control and **perfect safety** on the one hand; on the other an "unruly balky" machine, whose seemingly greatest ambition was to bring its occupants face to face with disaster.

Picture for yourself the story:

Two cars traveling the same country road—a rainstorm overtakes them. Reaching a treacherous, slippery curve—

ONE CAR with scarcely any noticeable slackening of speed rounds the curve and **passes on in perfect safety.**

THE OTHER at the critical moment, **skids,** and in a flash, plants itself in front of the onrushing trolley.

A mass of wreckage, "nerve-shattered" passengers and a lasting memory of what might have been if the trolley car had not been stopped.

One Car was skid-proofed with Weed anti-skid Chains. **The Other** was not. Take the lesson home.

Weed Chains

Absolutely Prevent Skidding

Are you still taking your life in your hands by refusing to take the necessary precaution against the dangers of skidding? Are you still unwisely depending on "rubber alone" for the safety of yourself, the occupants of your car and other road users?

Make safety yours—take no chances. Fully equip your own car with Weed Chains today and **insist,** for your own protection, that other drivers do the same.

Weed Chains cannot injure tires because "they creep;" are put on in a minute without the use of a jack or other tools. Use them on all four tires.

Concentrated Lubro Anti-Freeze Fluid

Makes Winter Driving a Pleasure

A Positive Insurance Against Freezing

IT'S RED

LUBRO ANTI-FREEZE FLUID is a Soluble Oil Which

- Will not freeze.
- Will not injure any part of the car.
- Will not evaporate or boil as easily as water.
- Will lubricate the pump.
- Will prevent rust and corrosion.
- Better adapted for cooling purposes than water itself.

One Gallon Is Sufficient for Your Radiator.
One Application Is Sufficient for the Season.

PRICE, $1.50 PER GAL.

For Sale at All Leading Garages and Supply Houses.

BOSCH

THE Spark plug is one of the important efficiency factors of an automobile; a perfect ignition source with cheaply constructed and poorly designed spark plugs would make the best car a disappointment.

Bosch Spark Plugs, As Good As Bosch Magnetos, have been successfully used by all the prominent race drivers and have proven themselves able not only to stand the most trying conditions but to give efficient sparks, unequalled by the ordinary plug.

Don't cheapen your ignition system---buy Bosch Plugs and be permanently satisfied; they sell at $1.00 each everywhere.

Write for "Locating the Spark Plug" an interesting book for motorists and dealers.

HEALTH
with which is consolidated
Medical Talk and Vim
HEALTH MAGAZINE COMPANY
27 VANDEWATER ST.
New York

U. S. Industrial Alcohol Co.,
27 William St.,
New York City, N.Y.

Nov. 1st, 1912.

Gentlemen:-

SUBJECT: DENATURED ALCOHOL.

It will probably be interesting for you to know that in my through all parts of North America, including Alaska and the Klondike I used, as a radiator non-freezing solution, a mixture of your alcohol and water and found same not only to be efficient but harmless. My return journey across the continent started from San Francisco November 5th, 1911, and terminated in New York January 5th, 1912. This was the first mid-winter cross-continental automobile trip in the history of the industry and the way lay over the Sierra Nevada and Rocky Mountains going as high as an elevation of 8,000 feet and through three feet of snow, and in weather ranging from zero to 30° below, and the worst winter that this country has seen for thirty years. On this trip I relied absolutely upon your alcohol for non-freezing solution purposes and it never failed me.

I also used the same alcohol for cooking purposes in the two stoves which formed part of my regular equipment.

I haven't any objection to your using this communication in any way you may see fit.

Gratefully yours,

Editor, Health Magazine.

PYRO DENATURED ALCOHOL
Non-Freezing Solution
ASSURES ENJOYABLE MOTORING THROUGH
WINTER'S COLD

All experts agree that among the so-called "anti-freezing" solutions, a mixture of Pyro (denatured) alcohol and water stands in a class by itself, having been accorded first prize in every practical test and contest held during the past two years. Always uniform—ever reliable—no corroding or electrolysis as from salt solutions—no rotting of rubber parts or foul odors as from glycerine. *Get our booklet.*

PYRO FREEZOMETER

In connection with the Pyro Alcohol solution we recommend the use of the Pyro Freezometer, manufactured by **Taylor Instrument Companies**, Rochester, N. Y. By it the **exact** freezing point of the solution can be obtained regardless of the temperature of the solution itself.

PRICE, WOOD CASE $1.50, METAL CASE $2.00

Write us for name of your local Pyro Dealer.

Peoria, Ill. **U. S. INDUSTRIAL ALCOHOL CO.** New Orleans, La.

27 WILLIAM STREET, NEW YORK.

CAN YOU LOCATE CARBURETOR TROUBLES?

THE ABC OF
Carburetor Construction
MAINTENANCE AND REPAIR

Will not only show how to locate troubles, but will enable you to adjust your carburetor to obtain the best mixture, which means increased power and economy of operation. Explains basic principles of carburetion in a simple manner and describes all standard forms. Over 50 illustrations and charts. Covers the subject thoroughly. Sent to any address in the United States or Canada on receipt of

35 Cents

It is a practical treatise for all who motor.

NEWTONE SUPERIOR

The First Efficient Motor Horn to sell at a popular price

Our $10 MOTOR HORN

Newtone Superior has created a tremendous sensation in the automobile trade for its EFFICIENCY, for PRICE and for ECONOMY. It uses only 2½ amperes; and a battery can last five months without recharging.

$1000 Reward

to the manufacturer, jobber, dealer or agent in the automobile trade who can produce or show us a motor driven horn now on the market of equal efficiency and quality to the **Newtone Superior** selling at our price (listed at ten dollars.)

We claim to have the best motor warning device on the market at this price.

Eight years in the exclusive manufacture of auto signals—during which time we have made and sold over ONE MILLION AUTO HORNS, and incidentally spent thousands of dollars in experimental work in perfecting our product—has made it possible for us to produce.

CAR MANUFACTURERS—Include **Newtone Superior** in your 1913 equipment.

DEALERS—Newtone Superiors will sell three to one. You should be well stocked.

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. TRY THEM NOW.

Don't wait until you are 10 miles from a Garage and find you need them.
Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

CONFUSING TECHNICAL TALK

of the kind that is sometimes used, tells the average man nothing. What you want to know is, how many hours (clock hours) will the GLBA Storage Battery light all the lamps on a car. There is just one way to find out; hook up your Electric Lighting Outfit with an GLBA Battery to your lamps, push the button and keep accurate tab on the time it takes to discharge battery. Do it yourself, don't take our word for it. You'll be surprised to learn how much better—and longer—your lights will burn than with other Batteries claimed to be "just as good." But, always,

BE SURE IT'S AN

GLBA

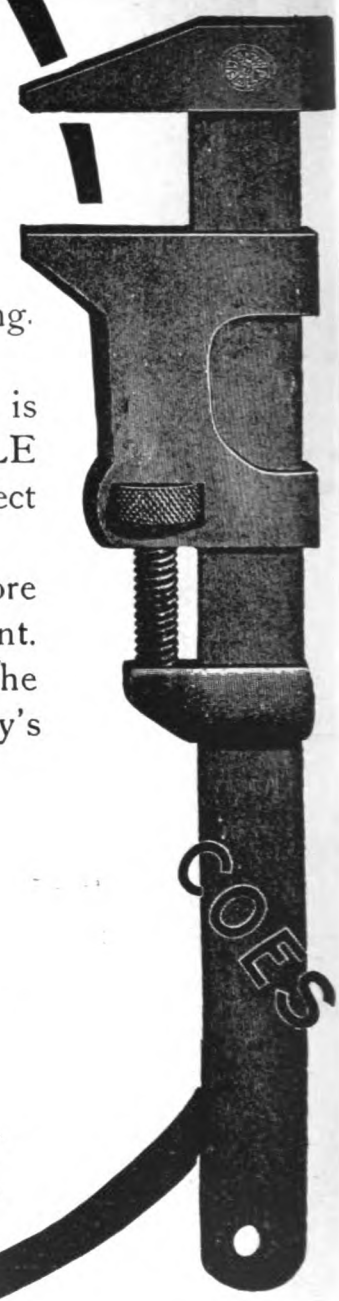
COES



THE
Wrench Supreme

Strength without bulk or clumsiness.
Ease of handling without slipping or bruising.
Perfect balance and right grip

Everything the motorist desires in a wrench is to be found in the "COES" AUTOMOBILE MODEL, and you will never know perfect wrench service until you pin your faith to it.

It stands to reason that the 5 per cent. more you pay for a "COES" wrench goes for 60 per cent. more quality and service—put this wrench in the tool kit and shop. You will get your money's worth.

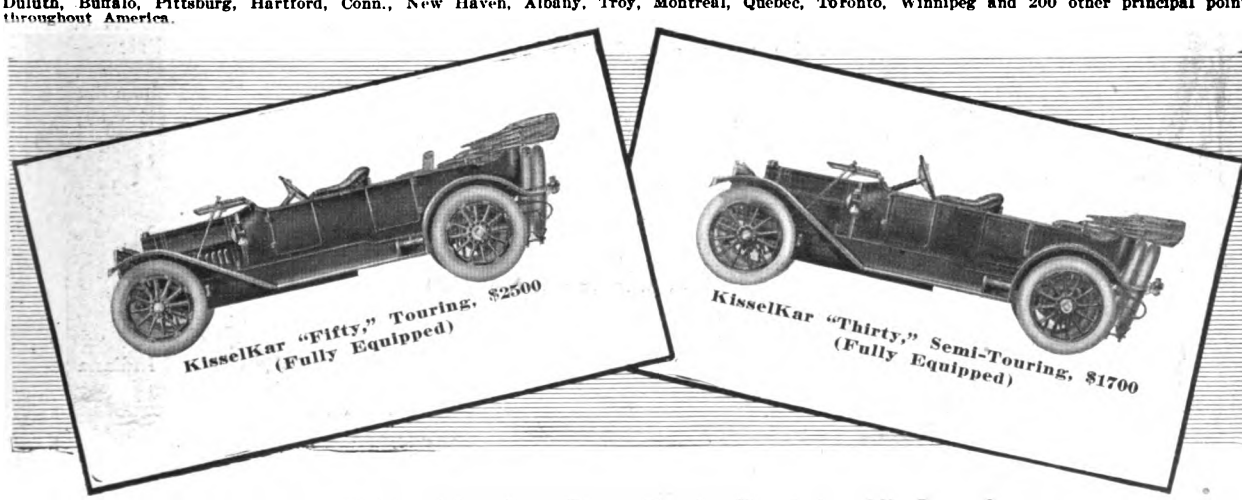
Compare the KisselKar with any car at any price

The riding comfort of the KisselKar surpassed every previous idea of car comfort. The extra liberal wheelbase, big wheels, big tires, shock absorbers, and eleven inches of the most resilient upholstery ever put into an automobile completely eliminate road vibration—the unusual depth of seats permits a quarter-reclining position, making it needless for occupants to brace against side-sway or lurches of the car on rough roads. KisselKar comfort is unapproached—it is a KisselKar quality exclusively—and the proof is in the riding.

Any KisselKar agency will give you the fullest opportunity to demonstrate the road capabilities of the KisselKar—and you are welcome to compare it with any car at any price—such comparisons are advantageous to the KisselKar. Write for 1913 KisselKar catalog—it is a valuable aid in judging car values.

KISSELKAR



"Thirty" $1700 "Forty" $2000 "Fifty" $2500 60 H. P. "Six" $3150

Fully equipped, including electric starting and lighting system, top, windshield, speedometer, shock absorbers, demountable rims, etc.—everything belonging to a perfectly appointed car.

"The Easiest Riding Car In The World"

The MARMON "32"

The graceful and beautiful lines of the new bodies distinguish the latest series Marmon "32" at a glance. The many refinements in equipment and appointments add to the comfort, luxury and ease of operation. But underlying all the new features is the same high standard of design, materials and construction that has made these cars world-famous in contests and service. No one can question the judgment of the Marmon owner in his choice of this car. The records of its performance are the highest indications of value.

Outline Specifications

Motor—4 1-2"x5", "T" head, 32-40 h. p. **Oiling**—Marmon system automatic force feed lubrication. **Ignition**—Two spark dual system. **Transmission**—Selective, sliding gear, unit with rear axle. **Clutch**—Cone. **Rear Axle**—Floating type, unit with transmission. Pressed steel housing. **Brakes**—Internal expanding, 403 sq. in. surface. **Wheelbase**—120 in. **Rims**—Quick detachable, demountable. **Tires**—35x4 1-2 front and rear. **Control**—Left hand steering, right hand control in center. **Carburetor**—Improved automatic float feed. **Springs**—Rear, full elliptic; front, semi-elliptic. **Body**—Marmon perfected cast aluminum construction with sheet metal seat backs. Deep cushions. Nickel trimmed. **Equipment**—Electric starting and lighting system with storage battery, Pantasote top, built-in windshield, speedometer and clock, electric light to illuminate entire dash, horn, shock absorbers front and rear, single tire carrier, extra demountable rim, coat rail, foot rest, assortment of tools, oiler, jack, tire repair kit and pump. **Prices**—Five-Passenger Touring Car or Four-Passenger Suburban, $3000.00; Two-Passenger Roadster, $2900.00; Limousine (seats seven) $4000.00; Landaulet (seats seven) $4100.00; prices f. o. b. factory, Indianapolis.

"The Easiest Riding Car In The World"

The MARMON SIX

When it became known there was to be a Marmon Six it was generally believed it would prove a car of surpassing value. During the time the Marmon Six has been under development and test we believe we have overlooked nothing that would add to the quality or capability of the car or that would enhance the safety, the comfort or the convenience of its user. So far as any test can be applied it is a proven car—brought to a place where we can say, "Here is a car that will live up to the Marmon name."

Outline Specifications

Motor—4 1-2"x6", "T" head, 48-80 h. p. **Oiling**—Marmon system automatic force feed lubrication, delivering oil through hollow crank shaft directly into main bearing, connecting rod bearings and piston pin bearings, also through hollow cam shafts to cam shaft bearings. **Ignition**—Two spark dual system. **Clutch**—Improved dry plate multiple disc. **Rear Axle**—Floating type unit with transmission. Pressed steel housing. **Front Axle**—A new type, an exclusive feature of the Marmon Six. The vertical spindle is placed in the direct center line of the wheel. This construction makes the safest, surest and easiest steering mechanism ever devised. **Brakes**—Internal expanding, 403 sq. in. surface. **Wheelbase**—145 in. **Rims**—Quick detachable, demountable. **Tires**—Front 36x4 1-2, rear 37x5; front and rear rims and tires interchangeable. **Steering Gear**—Left hand with center control. **Carburetor**—Improved automatic. **Springs**—Front, semi-elliptic; rear 3-4 elliptic. **Body**—Convex curve type Marmon perfected cast aluminum construction with sheet metal seat backs. Deep cushions. Nickel trimmed. **Equipment**—Electric starting and lighting system with storage battery, cape top, windshield designed as part of dash with provision for ventilation, speedometer and clock, electric light to illuminate entire dash, electric step light under tonneau doors, electric emergency lamp with long extension cord, electric horn, power tire pump, shock absorbers front and rear, tire carrier, extra demountable rim, coat rail, foot rest, assortment of tools, oiler, jack and tire repair kit. **Prices**—Seven, Five, Four or Two-Passenger Body Types, $5000.00; Limousine (seats seven) $6250.00; Berlin Limousine (seats seven) $6450.00; Landaulet (seats seven) $6350.00.

Mosler Spit Fire Plugs

SPECIAL HOLIDAY OFFER
ON MOSLER SPIT FIRE GENUINE IRIDIUM
Platinum Pointed Plugs
OUTLAST ALL OTHERS - WORKMANSHIP & MATERIAL
GUARANTEED FOREVER

This Handsome Leather

SPARK PLUG CASE

Given Free to Every Purchaser of Six of Our

GENUINE PLATINUM POINTED PLUGS

Six ½ in. or Metric Spit-Fire Platinum Pointed Plugs, $7.50
Six ⅞-18 A. L. A. M. Spit-Fire Platinum Pointed Plugs, $9.00

This special offer is limited to the holiday and show season. If you want one of these fine cases (cost at least **$1.50** retail) send your order to-day.

Mosler Spit-Fire Platinum Pointed Plugs are the finest plugs made.
They increase the power of the engine over 10% by actual test.
Give the hottest spark, even when batteries are low.

If You Want Trouble Proof Ignition Use Nothing But Genuine Mosler Spit-Fire Platinum Pointed Plugs

Our patented base construction protects the porcelain and sparking points; it acts as a condenser of electricity and intensifies the spark; the deep base forms a compression chamber in which the gas ignites first, then shoots a heavy flame out into the cylinder, firing the charge with the greatest speed and power.

More Spit-Fire Plugs are used and sold to-day than any other make. We have produced ten million plugs and our present facilities are unlimited. No other maker has the experience, manufacturing equipment and patent rights combined to make as good a plug as the Spit-Fire. For any engine, any thread.

If You Want the Case Free, Send Your Order at Once

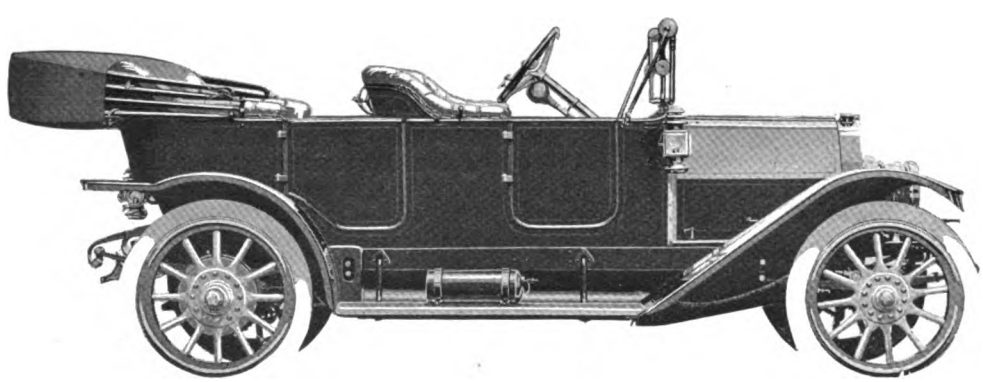
110-Inch Wheel Base
Timken Bearings
Center Control
Remy Magneto
Warner Speedometer
Mohair Top and Boot
Clear Vision Wind Shield
Prest-O-Lite Tank

High-priced feature No. 2



When an auto wheel hits a rut the frame must bend. Most popular priced makers try to hold the motor and transmission rigid by a *number* of arms. Overland motors are suspended at but three points. This method absolutely prevents disalignment. Otherwise, crank or gear cases bend and throw the engine bearings out. Disalignment prevents proper lubrication. It works general havoc with motor and transmission.

Experiment for yourself with three and four legged stools.

This is just one of the high-priced features in the Overland at $985. A catalogue for the asking tells you of the many others. Please address Dept. 52.

Automobile Journal
Show Numbers

NEW YORK: January 10th and 25th

CHICAGO: January 25th, February 10th

BOSTON: March 8th, March 25th

These shows are for the benefit of the owners and the enthusiasts who are considering purchasing. Ninety per cent. of the circulation of the AUTOMOBILE JOURNAL reaches the hands of readers that are within a few hours' ride of New York City, and this clientele is composed almost exclusively of owners.

Because the AUTOMOBILE JOURNAL is an exclusive automobile owners' magazine, because it has a distribution concentrated in this field, because it will reach the buyers who will attend these displays, it has a value to the advertiser that cannot be equalled by any other motoring paper.

To make the advertising sections of the magazine as distinct and as productive to our patrons as is possible, and to make them doubly attractive to the readers, all page advertisements will be printed on a fine grade colored coated paper, and at no additional charge over regular rates.

For advertisements in colors, which will give distinct insert effect on this stock, a nominal charge of $10 per color over regular rates will be charged. (Standard colors, red and black.)

No reservation for copy that is to appear in colored sections can be accepted after Dec. 20. Reservation orders will be given positions in the order of receipts.

MOTOR TRUCK SHOW NUMBERS

BUSINESS MEN BUY MOTOR WAGONS

They Know Their Needs and Select What Will Best Serve Their Requirements After Careful Investigation.

MOTOR TRUCK

Is a BUSINESS MAN'S AUTHORITY ON MOTOR DRIVEN ROAD VEHICLES.

Its Articles Are Not Statements of Theory Nor Assumptions. They Are Analyses of Results of Actual Service and Practical Methods—Facts That Are Authorized and Are Authority. Its Subjects Are Prepared to Inform Business Men and Are Accepted by Them for Face Value.

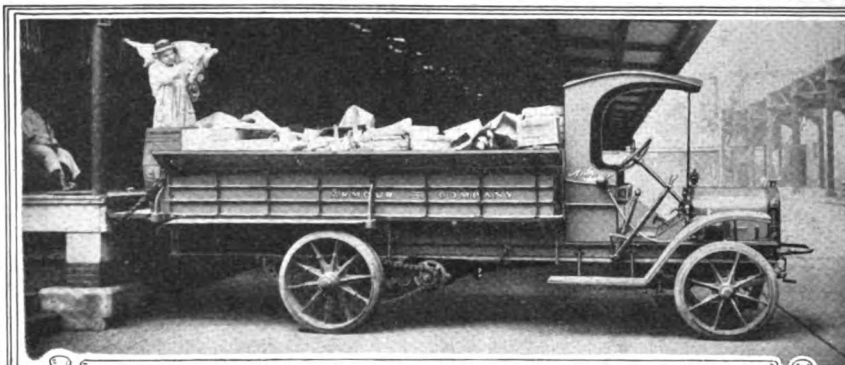
MOTOR TRUCK

JANUARY, FEBRUARY and MARCH ISSUES

Will Be the Most Complete and Comprehensive Presentation of Power Wagon Transportation Information Ever Published. Every Article a Feature—Every Subject of Intense Interest, Treated from the Practical Side for the Benefit of the Busy Man.

MOTOR TRUCK

Reaches the Business Man. He Reads It Because It Is Replete with Detail He Realizes He Must Know. Its Pages Are to Him a Reference, and Are Preserved.



MOTOR TRUCK

Publicity Reaches the Man You Want to Reach, and When He Is Interested. Its SHOW NUMBERS Will Contain the Facts He Wants. If You Want Business, Go to Those Who Want to Do Business. The Readers of MOTOR TRUCK Are Buyers. Its Service Is the Cheapest Known for the Quality.

One of the Squadron of Twenty-Four White Motor Trucks Owned by Armour and Company, Chicago, and Operated by them in the Principal Cities of the United States

WHITE MOTOR TRUCKS

The predominant use of White Motor Trucks by the foremost mercantile and manufacturing firms, not only in the United States, but throughout the world, is the most convincing proof of their superior merit in practically every line of service.

A Few Well-Known Owners of White Squadrons

American Can Company	Joseph Horne Company
American Chicle Company	Hudson's Bay Company
American Steel and Wire Company	Illinois Steel Company
Armour and Company	McCreery and Company
Berghoff Brewing Association	National Cash Register Company
Booth Fisheries Company	Pabst Brewing Company
Brazilian Government	Philippine Islands Government
Coca-Cola Company	Postum Cereal Company, Ltd.
Cudahy Packing Company	Remington Typewriter Company
Diamond Rubber Company	Russian Government
T. Eaton and Company, Ltd.	W. and J. Sloane
Marshall Field and Company	Standard Oil Company
Gimbel Brothers	United Cigar Stores Company
B. F. Goodrich Company	United States Government
Gulf Refining Company	Winchester Repeating Arms Company

White Motor Trucks are built in capacities of 3-4, 1 1-2, 3 and 5 tons, and all models are uniform throughout in parts and design, thus making them the most practical for the standardization of delivery or transportation service. Literature and detailed information furnished on request.

VOL. XXXIV, No. 9 DECEMBER 10, 1912 Price, $1.00 the Year

STARTING THE MOTOR IN COLD WEATHER.

Effects of Heavy Fuel and Reasons Advanced for Its Use—Factors Making for Proper Carburetion and Suggestions for Overcoming Troubles of This Character—Priming Devices and Their Application.

ALREADY motorists are beginning to find that they have greater difficulty in starting a motor that has been exposed to cold than has been true in previous years. That the new owner should complain is to be expected, but even the more experienced driver holds that the situation presents new features which have not been noted heretofore except in the severe cold weather of the winter months. With a majority the conclusion has been reached that the gasoline is to blame, and it is condemned accordingly, without investigating the subject.

Starting a Cold Motor in Winter Is Usually Accompanied by Considerable Effort on the Part of the Driver.

While it is admitted by the refiners that the grade of motor fuel marketed today is heavier than it was several years ago, and that 76 test gasoline made for easier starting, the writer holds, and he is borne out in his contentions by authorities on carburetion, that there may be a number of other conditions responsible for starting troubles. Before considering these factors, or the reasons advanced for the heavy grade of fuel, a few words upon carburetion will be of particular interest to the inexperienced motorist.

Gasoline, as is well known, is extremely volatile; that is, it will evaporate readily and its vapors will combine with air to form an inflammable gas, and at ordinary temperatures. To carburet means to combine certain proportions of air with any gas so that its combustion or burning will be so rapid that it becomes an explosion. The amount of air required will vary within certain proportions and some mixtures will burn sooner than others. Combustion is simply

Digitized by Google

burning, and may be very slow, moderately fast, or practically instantaneous.

If there is too much or too little air in proportion to the fuel vapor, the burning or combustion will be slow and the explosion weak. It is evident, therefore, that the richer the mixture in fuel, the quicker it burns, though best operating results are not obtained with a rich mixture, this being better adapted for starting or slow running. While it would appear a simple matter to obtain the desired mixture, and that almost any device which would permit of a current of air coming in contact with the liquid fuel could produce a combustible gas, it should be borne in mind that the object sought by the makers of carburetors is to design an appliance capable of producing a mixture which will be of proper value at all motor speeds, as well as permitting of flexibility without excessive use of fuel.

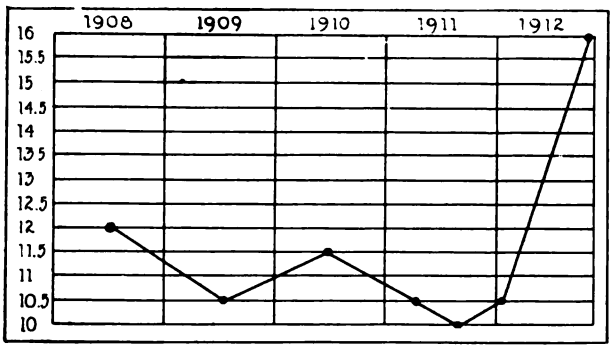

Chart Showing the Fluctuation in Price of Motor Fuel from 1908 to the Present.

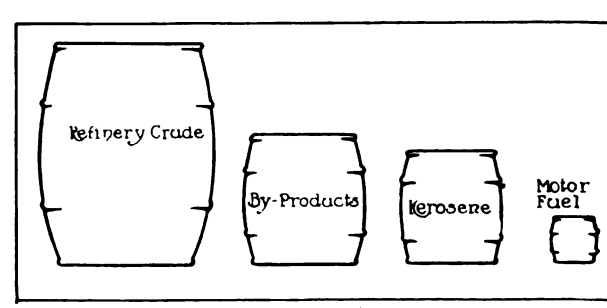


As previously stated, gasoline vaporizes very readily at ordinary temperatures, but if it is very cold it will not vaporize in sufficient quantity to make the proper mixture and ordinarily there will be too much air and not enough vapor, making for a lean mixture which is slow burning. Condensation is another factor to be considered and although the carburetor may be performing its function properly, the mixture may be "killed" on its way to the combustion chamber. Obviously the remedy would appear to be the enriching of the mixture, but while this would favor starting it would not make for proper carburetion at high speeds nor compensate for the varying compression values with the throttle opening.

To vaporize the heavy fuel successfully for starting purposes as well as to provide a suitable mixture at varying speeds, the carburetor manufacturer incorporates self-priming devices for enriching the mixture for starting or for restricting the air, or both. With either construction it is held by carburetion authorities that it is possible to start the motor in cold weather provided its components are performing their functions properly. This contention appears to be borne out in practise by some cars, the owners of which experience but little trouble in starting a cold motor.

While it is admitted that it is more troublesome to start a cold motor with a heavy grade of fuel than with a more volatile fluid, there are other factors which should be considered. Dealing first with ignition, it may be pointed out that in theory the spark is supposed to occur when the compression stroke has been completed and the piston is about to descend on the firing or power stroke. In practise, however, it takes place much earlier, the degree of advancing the spark, as it is termed, depending upon the motor speed. The object of the advance is to time the spark so that the combustion will be as complete as possible and the greater portion of the mixture will be converted into useful energy.

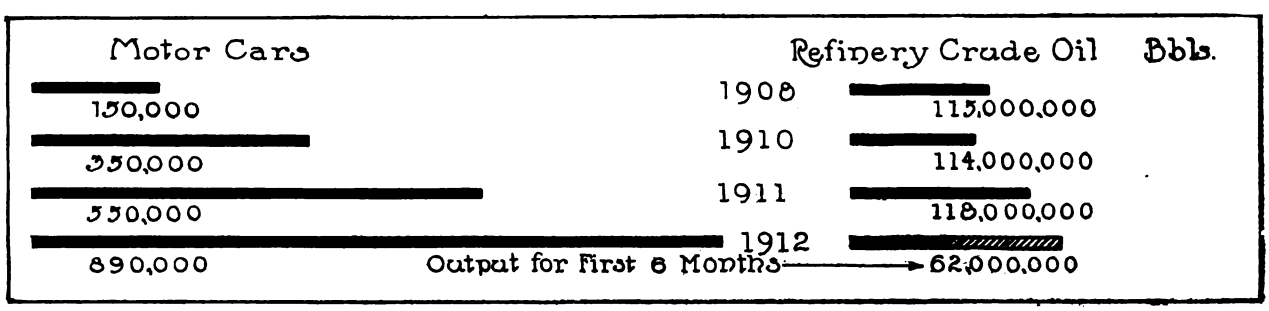
It is a well known fact that if a motor be cranked slowly upon the batteries with an advanced spark, a back fire is likely to ensue and the beginner is cautioned against attempting to start the engine with the spark other than in a fully retarded position. It is conventional practise to so set the timer, distributor or magneto that the break in the primary or battery circuit is made and the secondary current is induced when the piston has begun its downward movement on the firing stroke, and in some types of motors this retard may be increased over normal because of wear in connections or alterations in the overhaul of the power plant.

Assume that the retard is abnormal, that the motor is cold and that the mixture is very lean.

The Amount of Motor Fuel Obtainable from a Barrel of Crude Refinery Varies from Four to 16 Per Cent.—The Increased Production of Kerosene and Other By-Products Bears a Very Close Relation to the Cost of Motor Fuel.

To these complications add condensation of the mixture in the intake pipes, which results in a still weaker mixture reaching the combustion

Digitized by Google



chamber. The usual quarter turn of the starting crank not resulting in an explosion, the motorist will spin the handle rapidly, and with the spark still retarded. If the mixture ignites, which is doubtful, the piston having completed a large portion of its travel, the explosion is weak, due to the slow burning of the gas. The value of the compression is also lost—an important factor.

Still another feature to be considered, and one that is generally overlooked by the motorist, is the condition of the batteries. With the general adoption of the magneto, the dry cell or storage battery is employed largely for starting, and as a result of this intermittent use it is not given the attention that formerly was true when it was utilized solely. Frequently—and not always in the winter either—the batteries are allowed to deteriorate, and are held to be good enough to start on, as the magneto supplies the necessary current for running. With a spark that is too late, leaks in the carburetion system, a lean mixture and a weak battery, it is evident that the fuel is not wholly to blame. The writer has often noted that operators who failed to start on the batteries in cold weather have been successful when the magneto was utilized, but with the spark advanced. It should not be understood that it is suggested that the spark should be unduly advanced when the batteries are being employed, attention merely being called to the possibility of the late spark and its effect upon starting.

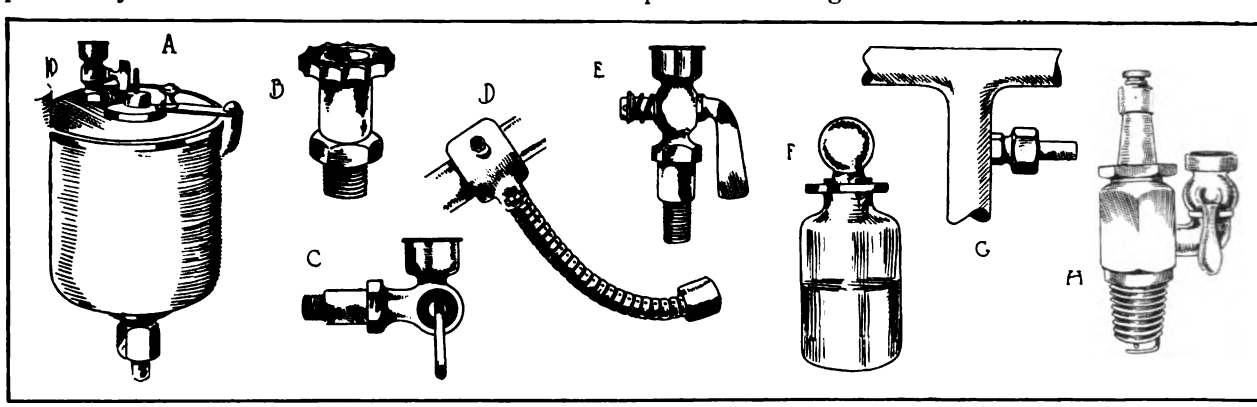
Reverting to the subject of fuel, the heavy grade and increased cost of which are viewed with alarm by motorists and those utilizing internal combustion engines: Those who are familiar with the products of petroleum, from which motor fuel is derived, hold that the advancing demand has compelled refiners to obtain a greater percentage of carburetant from their crude oil.

Technically, gasoline is the lightest distillate obtained from petroleum and its gravity is 90 to 78 degrees Baume. Only 1.5 per cent. is secured from the total weight of crude oil. Next in the list comes naphtha C, amounting to 10 per cent. of the whole and having a gravity of from 78 to 68 Baume. These two distillates were formerly combined for motor car use, but the increased demand for fuel forced the refiners to add to these, naphtha B and A having two and 2.5 per cent., respectively, of the crude petroleum base and gravity ranges between 68 and 60 degrees Baume.

While it would appear from these figures that a gallon of crude oil yields 16 per cent. of its weight in motor fuel, it should be borne in mind that no crude will show this percentage at all times. Even the best of Pennsylvania crude will only show 16 per cent. occasionally, while others yield but two, and some none at all. The amount of motor fuel distilled from the crude varies from four to 16 per cent., according to the richness of the oil. When it is considered that one state yielded 81,000,000 of the 220,000,000 barrels of crude in 1911, and that the percentage of motor fuel derived was exceedingly small, it would appear that the average would be nearer 10 than 16 per cent.

Statistics Showing Factors Governing the Gasoline Market—In Four Years the Number of Motor Cars Has Quadrupled.

It is held by some that the refiners have not increased their output, but statistics show this to be erroneous. The total production of crude petroleum in 1908 was 178,527,355 barrels, this yielding 115,000,000 barrels of refinery crude, from which motor fuel is obtained. The total production of crude in 1911 was 220,449,391 barrels or approximately 118,000,000 barrels of crude refinery, an increase of nearly 42,000,000. It is estimated that for the first six months of the present year the oil fields yielded 62,000,000 barrels of crude refinery, at which rate the total production for 1912 may be placed at 124,000,000.



It is but natural to assume that the refiner is interested in the by-products, the marketing of which has a decided bearing upon the price of motor fuel. One authority holds that the products of the distillation of crude petroleum yield

Digitized by Google

approximately the following percentages:

Gasoline (petroleum spirit)	1.5
Naphtha C	10.0
Naphtha B	2.5
Naphtha A	2.0
Kerosene	50.0
Lubricating oil	15.0
Paraffine wax	2.0
Residue and loss	16.0

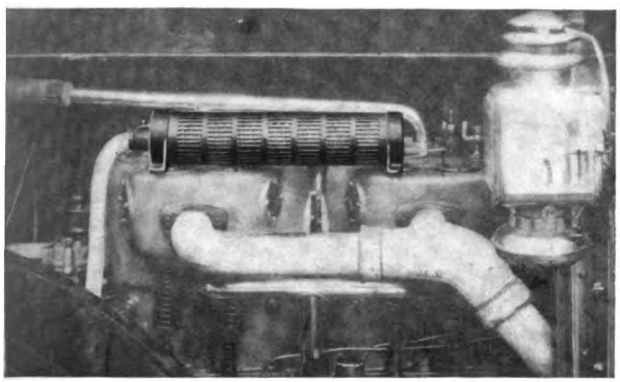
Another claims that but 40 per cent. of the crude refined is kerosene, having a gravity of between 56 and 32 degrees Baume—too low for motor use. These figures, however, will vary according to the richness of the crude, the method of refining, etc., as previously explained. It is evident that to obtain the desired motor fuel an enormous amount of kerosene is left on the producers' hands and that gasoline is the principal product and kerosene the by-product, a condition dissimilar to that previous to the appearance of the internal combustion engine when there was practically no market for the inflammable fluid.

Illustrating Devices Facilitating the Starting of the Motor: A, Petcock for Injecting Ether in Float Chamber; B, Morgan Priming Cup; C, Design for Horizontal Cylinders; D, Flexible Tubing for Conveying Heated Air to Carburetor; E, Conventional Type of Priming Cup; F, Ether Should Be Carried in a Bottle Having Ground Glass Stopper; G, Tapping Intake Pipe; H, All-in-One Spark Plug.

As the price of a product is governed largely by the prices of its by-products, it follows that the increased production of kerosene bears a very close relation to the cost of motor fuel. With the amount of kerosene increasing proportionately with the distillation of motor fuel, the marketing of the by-products becomes a serious problem with the refiners.

It is pointed out that the demand for kerosene is not keeping pace with that of motor fuel and this contention appears to be borne out when it is taken into consideration that electricity is replacing oil even in the agricultural districts. Thousands of farmers and others residing beyond the limits of the central service station install their own lighting plants, operated by gasoline motors. It is estimated that over 800,000 gasoline engines were sold last year, these ranging from the tiny machines that run separators to those of 3000 horsepower utilized in larger power plants for generating electricity and other purposes.

The demand for motor fuel is further augmented by the increasing popularity of motor boats and while figures are not available dealing with the fuel consumed by these engines, they doubtless would prove interesting. Statistics of motor cars show that the number of machines in 1908 was approximately 150,000, and that up to June of the present year there were 890,000, a gain of nearly 500 per cent. Add to these the thousands of motorcycles and there is reason for apprehension. The day is not far distant when the motor fuel problem will assume serious proportions.



Many motorists believe that the heavier fuel is not as good as that of lighter gravity, but although starting is made more difficult, the new product has a greater number of heat units and consequently makes for more power. Improvement is noted in carburetors, the mixture being enriched for starting, while the development of the motor starter relieves the owner of the laborious cranking.

It is possible, however, even with improved carburetors and certain types of motor starters, that the temperature may be so low that the fuel will not vaporize sufficiently to make an explosive mixture. In such instances the temperature must be raised, and for the benefit of those not familiar with starting the motor in cold weather the following suggestions will prove of value.

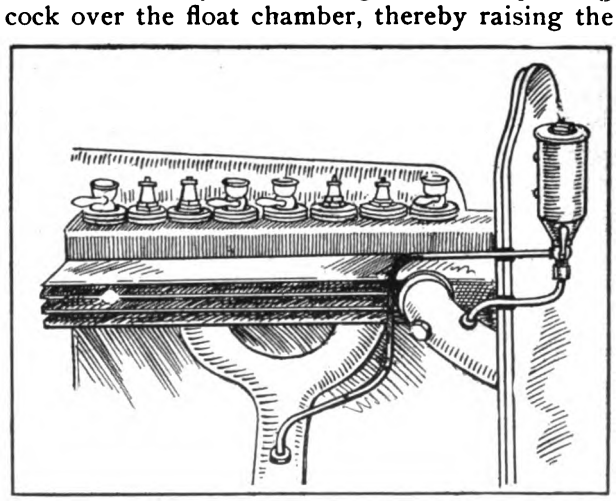
For the automobile that is garaged in a cold building there are a number of devices which have for their object keeping the motor or the water warm. These include an electrical heater manufactured by the Consolidated Car Heating

Digitized by Google

Company, New York City. It is placed on top of the motor, being connected to the main line by a plug, and it is held that by its use freezing of the

An Electrical Heating Device for Keeping the Water Warm, Making for Easy Starting.

water is prevented, making starting an easy matter in the morning. Another type, the Never-out, made by the Rose Manufacturing Company, Philadelphia, utilizes a small amount of city gas which is consumed in a special burner contained in the heating apparatus. This is attached to the radiator, and when in operation the water is kept warm, as well as the motor. A safety screen eliminates possibility of fire.

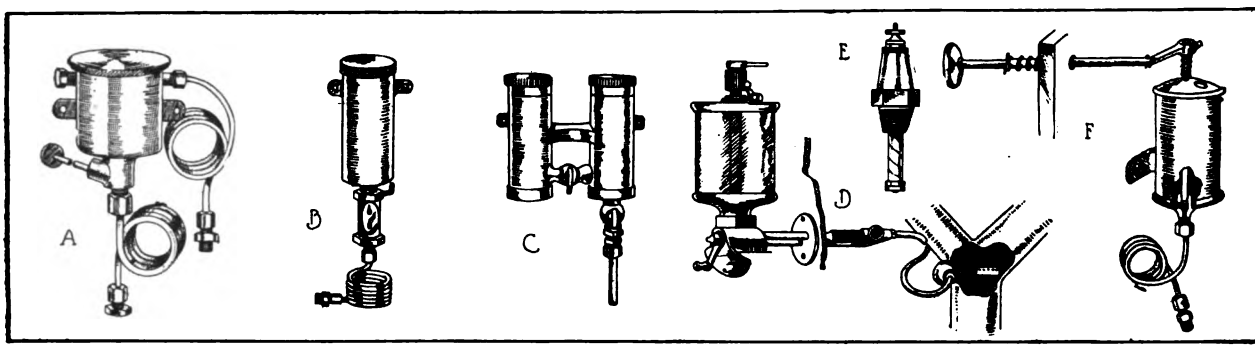


An owner who employs his car in his business, places an ordinary electric lamp near the intake manifold, turns on the current and covers the hood and radiator with a blanket. By the time he has completed his breakfast the motor is warm enough to make starting fairly easy. There are several other suggestions of this nature, among which are: Filling the radiator with hot water when it has been emptied, placing a heater of the foot warmer type within the hood, heating a bag of sand and wrapping it about the intake pipe and carburetor, and pouring hot water over these members. The object sought is to raise the temperature of the fuel and intake pipe, facilitating carburetion and permitting running of the motor until it has become warm through natural operation.

The above suggestions, however, are not applicable when the machine has been left standing out of doors while the owner is attending the theatre or making a call. It is true that by blanketing the radiator and hood the heat will be retained for a considerable period, but if the weather be very cold and the car be exposed to the wind, difficulty will be encountered in starting. Some motorists make it a practise to start the engine at frequent intervals to keep it warmed up, but this is not always convenient.

One of the simplest methods employed is that of priming. The operation consists of injecting a small quantity of gasoline in the combustion chambers through petcocks provided for that purpose. Ordinarily, if the spark be strong and occur at the proper time, the motor will respond, but when it is very cold it may be necessary to prime the cylinders several times until they have become warmed by repeated explosions. There is considerable difference between priming and flooding, and the use of too much gasoline at one time should be avoided.

Some cars are not provided with priming cocks, necessitating the removal of the spark plugs when injecting the fuel, but this trouble may be overcome by using priming spark plugs, among which is the All-In-One, having a priming cup integral therewith. This is made by the Frontier Specialty Company, Buffalo, N. Y.



While the regular fuel will yield good results for this purpose in ordinary temperatures, when zero weather is encountered it will be necessary to employ a more volatile fluid, such as sulphuric ether. This should not be used alone, but mixed with the fuel, and for priming purposes a few drops added to a small bottle of gasoline will serve. As it evaporates readily ether should be carried in a bottle having a ground glass stopper. A driver who operates considerably in winter and whose car is exposed for long periods, states he obtains excellent results by placing a few drops of ether in the carburetor. The fluid is injected through a small priming cock over the float chamber, thereby raising the

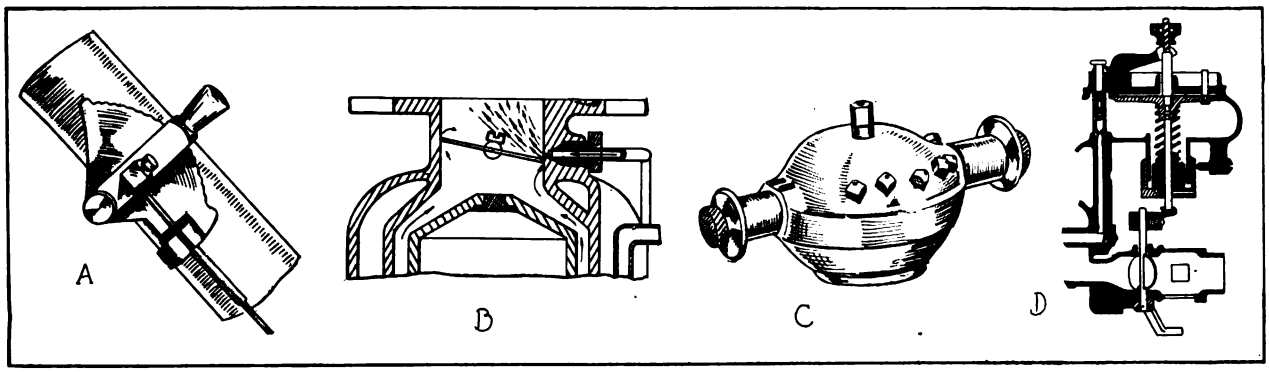
Illustrating Devices Designed for Priming the Motor: A, Webb Jay Automatic Suction System; B, Nelson Sight Feed; C, National Mixer and Primer; D, Buckeye Sure Starter; E, Stalit Plug, Heated by Electricity; F, Fowler Self-Closing Priming Cup.

The heavy motor fuel has resulted in the exploitation of a number of devices for making starting easy. The majority operate on the priming principle, although one heats the walls of the intake manifold by electricity. The Gilson motor starter, made by the Gilson Motor Starter Company, Indianapolis, Ind., not only makes for easy priming of the inlet pipe, but after the first explosion the mixture is preheated before entering the cylinders. The supply of gasoline is carried in a neat brass cup on the dash and the fuel is fed to a three-way valve. From the latter a tube leads to the exhaust manifold, around which it is wound once, and another pipe is tapped into the intake manifold. In starting the valve member is opened, allowing a small quantity of gasoline to flow to the intake pipe. Cranking the motor results in air being drawn over the wet pipe, making a rich mixture. Continued operation is assured through heating the intake pipe by the hot air drawn from the exhaust. The company announces a 1913 model which differs from that described in that the fuel container is located inside the hood and control of the fuel and hot air is by a handle located convenient to the driver.

Two priming attachments are marketed by the Fowler Lamp & Manufacturing Company, Chicago, these being the Webb Jay Automatic and the Fowler. The former comprises a container having a screw cover and a controlling handle. The supply of fuel is taken by suction from the main fuel line by a pipe and another tubing leads to two points in the intake manifold. The gasoline is fed automatically to the container and the flow of fuel to the intake is easily controlled by the operating handle. It is claimed of the device that the mixture may be enriched for starting and operating the engine until it has become sufficiently warm. Another feature lies in that the cylinders may be primed upon stopping the motor, making it possible to start on the spark.



The Fowler device permits of priming the intake pipe from the seat, it being operated by a push handle and the controlling valve closes automatically when the handle is released.

The Sight Feed primer, made by the Nelson Manufacturing Company, Chicago, operates on a similar principle, but differs in that a sight feed is incorporated, permitting the operator to note the amount of gasoline fed to the intake mani-

fold. The National Manufacturing Company, Kalamazoo, Mich., markets the National compound mixer and primer, comprising two vessels, one of which contains the fuel. The flow of the fluid to the intake manifold is controlled by a valve and the mixer regulates the amount of air.

The Buckeye Sure Starter, manufactured by the Central Brass & Fixture Company, Springfield, O., is held to produce a starting mixture within the intake manifold by a special spraying device. The fuel is contained in a glass member of the oil cup type. To utilize, the control lever is moved to the left and the fuel valve opened, allowing a small quantity of gasoline to flow. The control handle is then moved to the right and the motor cranked. The amount of air led to the spraying nozzle in the intake pipe may be regulated and the maker points out that proper carburetion is secured easily and full economy is effected thereby. In cold weather it is recommended that a one-quarter solution of ether be employed. The vessel holds enough fluid for 12 to 16 starts, depending upon the size of the motor.

With the Stalit heating plug, marketed by George Staats & Co., Brooklyn, N. Y., the air in the intake pipe is heated by electricity. The plug is screwed into the intake manifold and a wire is led to it from the battery. By closing the circuit it is held that the plug will heat the manifold, preventing condensation of the mixture as well as making for easy starting. It is operated by any six-volt battery.

Reference has been made to the devices incorporated in carburetors for making possible starting the motor with a heavy grade of fuel. The principle involved is that of enriching the mixture, and this is accomplished by restricting the air or by using an abnormal amount of fuel. This practically is what the motorist does when he shuts off the air by closing a butterfly valve and by depressing the float or flooding the carburetor.

Several manufacturers, including the makers of the Rayfield, Stromberg, Schebler, Holley,

How the Mixture Is Enriched and Controlled: A, Flexible Metal Hose, Hot Air Scoop and Dash Control of Holley; B, Dashboard Adjuster of Schebler, Restricting Air; C, a Cup Shaped Extension of the Venturi Tube Provides a Starting Charge in the B-D; D, Self-Priming Feature of the Bennett, on the Surface Principle; E, Showing the Priming Tube and Secondary Well of the Zenith.

Digitized by Google

Newcomb, New-Miller and others, provide dash controls whereby the air may be restricted, the carburetor primed, etc., by the driver without leaving his seat. By the use of these dash controls it is possible for the operator to change the mixture for starting or running as desired.

It is noticeable that many makers are equipping their carburetors with means for conveying warm air from the exhaust pipe to the air intake of the vaporizer in addition to water jacketing the float chamber. While either construction does not effect starting, the use of a flexible metal tubing does facilitate the vaporization of the fuel after the first few explosions are obtained. Lack of space prevents describing the various methods employed in carburetor construction for making starting possible without priming or the use of artificial means, but the accompanying illustrations depict sectional views of vaporizers in which the mechanism is incorporated, and a little study will enable the reader to understand the principles involved.

W. K. Hadley, Factory Representative, on 35,000-Mile Trip in Lenox Six.

REEVES WITH TRUFFAULT-HARTFORD.

Former United States Motor Manager Now Vice President of Hartford Suspension Company.

Edward V. Hartford, president of the Hartford Suspension Company, Jersey City, N. J., maker of Truffault-Hartford shock absorbers, electric starter and lighter and other high grade motor car specialties, has announced that Alfred Reeves, formerly general sales manager of the United States Motor Company, has been elected vice president and general manager of that concern. Mr. Reeves, it was stated, has acquired a substantial interest in the company. He will assume his new duties early in January.

Probably no man in the industry has a wider acquaintance or is more favorably known among automobile manufacturers, engineers and dealers than Mr. Reeves, and coupled with the inventive genius of Mr. Hartford he may be expected to bring the company's products into greater prominece than ever before. The company has just completed in Morgan street, Jersey City, an additional eight-story steel and cement factory structure, supplying more than 100,000 square feet of floor space for its productive work.

LONG TRIP IN LENOX SIX.

Factory Representative Plans to Cover 35,000 Miles in New Car Before Returning.

That this is to be in many respects a six-cylinder year is being brought home to prospective owners nearly every day. Among the manufacturers who are bringing out new models with motors of this type is the Lenox Motor Car Company, Boston, Mass., which experienced such splendid success with its four-cylinder car last year.

An accompanying illustration presents W. K. Hadley, one of the factory representatives of the company, who recently began a 35,000-mile trip in the interest of the concern. Already he has covered 5000 miles, visiting the cities in New York, New Jersey and Pennsylvania and closing numerous agencies. He expects to arrive in Chicago in due time and may possibly reach the Pacific Coast. Thus far he has met no trouble of any nature.

Plans are being made for a $50,000 grand prize road race between Los Angeles and San Francisco, Cal., to take place July 4, 1913. If successful this would be followed by a series of races between these cities, with an alternation of starting points each year.

The recent movement in St. Louis looking toward the adoption of motor boat light signals by automobilists has not proven successful. Several who have tried the scheme have found that the red light visible from the front leads those in approaching cars to think they see a rear light and head-on collisions have been narrowly averted.

WOULD LIMIT TRUCK SIZE.

New York State Highway Commission Following Example Set by Massachusetts.

It will be remembered that a bill was introduced in the Massachusetts legislature a year ago limiting the size of motor trucks permitted to be used on the highways of that state. This was referred to the next legislature, and undoubtedly will come up for action next January. In the meantime the highway commission in New York State has been engaged upon the draft of a similar bill. At present the commission is divided between two propositions which are set forth in the following:

First Proposition.

It shall be unlawful for any person, firm, association or corporation to draw or propel, or cause to be drawn or propelled, over any state or county highway which has been or may hereafter be improved by the state, or state and county, any vehicle the weight of which shall exceed, in combined weight of load and vehicle, as related to the width of tire, the weight per width as given in the following table.

Second Proposition.

The following regulations to apply only to various forms of macadam and gravel highways as built by the state, or state and county. Combined weight of load and vehicle to be limited to a maximum of 400 pounds per inch of width of tire carrying the same. Under this regulation four-wheeled vehicles carrying evenly distributed loads might be loaded to the following:

Vehicles with	Maximum load, pounds. one axle*	both axles†
1-inch tires	....	1,600
1.5-inch tires	1200	....
2-inch tires	1600	3,200
2.5-inch tires	2000	....
3-inch tires	2400	4,800
4-inch tires	3200	6,400
5-inch tires	4000	8,000
6-inch tires	4800	9,600
7-inch tires	5600	11,300
8-inch tires	6400	12,800
9-inch tires	7200	14,400
10-inch tires	8000	16,000

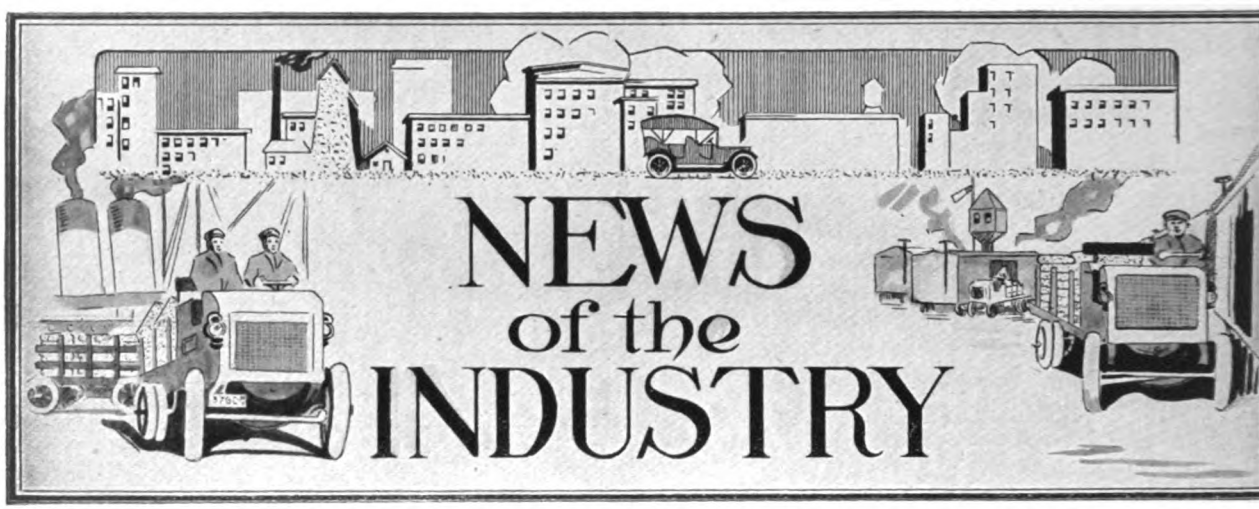
*First proposition; †second proposition.

The proposed bill goes on to state that it shall be unlawful to use any vehicle the load upon either axle of which shall exceed 8000 pounds—or total load of 16,000 pounds in the second proposition—although the power to issue permits is reserved to the highway commission. State or county highways built of brick laid upon concrete base and those having a roadbed of concrete of six inches or more in thickness are exempted from the provisions of the proposed regulations.

Over almost impassable roads, through a disagreeable snow storm from Erie, Penn., to Buffalo, N. Y., Walter E. Burke, branch manager of the Michigan Motor Car Company, and his assistant, Robert Kendall, both of Boston, recently drove a 1913 40 horsepower Michigan from the home factory at Kalamazoo, Mich., to Boston, a distance of 1186 miles, in six days. The trip was made to satisfy the salesmen that the car would withstand the strain of rough roads and all weather conditions. Although the men were nearly exhausted when they arrived in Boston they reported that it had not been necessary to make a single mechanical adjustment or change a tire during the journey.

ENGINEERS' WINTER MEETING.

Interesting Programme Arranged for Convention During the New York Show.



The winter meeting of the Society of Automobile Engineers will be held at the Hotel McAlpin, New York City, Jan. 16-18, during the progress of the second section, or commercial vehicle division of the New York show. The annual society dinner will be held Jan. 17.

Among the subjects which have been assigned for discussion are the following: "Worm Gears," "Wire Wheels," "Will the Six-Cylinder Motor Eventually Displace the Four-Cylinder for Pleasure Cars?" "Motor Sizes for Trucks," "With the Electric Starter, Lighting Plant and Ignition Possible in One Unit, Will the Magneto Be Discarded?" "Why Has the 42-Inch Wheel Disappeared?" "Is the Transmission Preferably Located on the Rear Axle, as a Separate Unit or Combined with the Power Plant?"

Those who will read papers include the following: "Effect of Relation of Bore to Stroke in Automobile Engines," J. M. Thomas; "Method of Brake Capacity Determination," S. I. Fekete; "Leaf Springs," L. J. Lane; "Standardization of Drawings," George W. Dunham.

San Jose, Cal., has established something like a record in the quick organization of a motoring club. At the beginning of November a number of enthusiasts decided that the Garden City should have an automobile organization and club house. Promptly they got together and organized a country club. Within the next two weeks they secured a membership of 275, raised $45,000 in actual cash, bought 90 acres of foothill land and let a contract for the erection of a handsome club house. There also will be a large and attractive garage.

PEERLESS TO INCREASE CAPITAL.

Stockholders Meeting Called to Act on Proposition to Add $7,000,000 to Present Stock.

Stockholders of the Peerless Motor Car Company, Cleveland, O., maker of Peerless trucks and pleasure cars, will be asked at a special meeting Dec. 20, to consider and vote upon the proposition to increase the capital of the company from $3,000,000, its present authorized stock, to $10,000,000.

This is to be divided, according to the plans, into 100,000 shares of $100 each, of which issue 50,000 shares shall be disposed of as preferred stock and the remainder as common stock, subject to the usual restrictions. The stockholders also will vote upon the matter of authorizing the directors to dispose of the increased stock and also upon a proposal to amend the code of regulations of the company.

SOLVING CAR SHORTAGE PROBLEM.

Service Bureau of National Association of Automobile Manufacturers Adopts Trial Plan.

The service bureau which the National Association of Automobile Manufacturers at its last meeting voted to establish at Detroit, Mich., the heart of the automobile industry, has been installed and already a comprehensive system is being arranged to improve the railroad traffic in motor cars. It is thought that the new system will give the automobile manufacturers many more freight cars during the shipping season than has been the case heretofore and thus the car shortage will be greatly minimized.

When a shipment is made the numbers of the cars are taken and forwarded to the railroad officials who will make delivery of the freight, with a request that the cars be protected and returned as soon as possible to the railroad which made the original shipment. A system of daily reports has been arranged to show the location of the various cars en route. A large percentage of the delays is occasioned by the demurrage rules, but the service bureau hopes to improve largely the present service by its new system.

ENOS SUCCEEDS HOOPER.

Buffalo Man Selected to Head American Automobile Association—Annual Reports.

A balance of $3293 in the treasury, all bills paid and the good roads movement making satisfactory progress throughout the country as a result of the efforts of the organization were the features brought out at the annual meeting of the American Automobile Association, held at Chicago, Dec. 2-3. Robert P. Hooper retired as president, as previously announced, and Laurens Enos of Buffalo, N. Y., was elected as his successor.

There was shown to have been a deficit in the contest department when William Schimpf became chairman of the contest board, but he was able to pay all bills and show a small surplus in the bank. The board granted 132 sanctions. Twenty more tracks were licensed than ever before and 94 meets were held during 1912 as against 52 in 1911 and 72 in 1910. The board took in $13,225 in sanction fees; $100 for stock car certificates; $1140 for drivers' fees; and $320 for track licenses. The expenses of the board

Digitized by Google

for the season amounted to $8170.

The new officers elected follow: President, Laurens Enos, Buffalo; first vice president, John A. Wilson, Pennsylvania; second vice president, Dr. H. M. Rowe, Maryland; third vice president, R. W. Smith, Colorado; fourth vice president, F. L. Baker, California; fifth vice president, Asa Maine, Minnesota; secretary, J. N. Brooks, Connecticut; treasurer, H. A. Bonnell, New Jersey; chairman of executive committee, A. G. Batchelder, New York. It was decided to open a branch headquarters at Washington, D. C., and the next annual meeting will be held at Richmond, Va.

President Enos, at the first meeting of the new executive committee, announced the reappointment of the following chairmen: Contest committee, William Schimpf; good roads. George C. Diehl; touring, Howard Longstreth; legislative, Charles T. Terry.

A KEROSENE DRIVEN CAR.

Arthur Mason Said to Be Engaged in Designing Machine to Use No Gasoline.

It is understood that Arthur C. Mason is designing a car to be produced by the Republic Motor Company, Flint, Mich., which will use kerosene exclusively. This statement is taken to mean the motor will be supplied with kerosene only, since Mr. Mason is quoted as saying that it was possible to do away with the use of gasoline even for starting purposes.

The Republic Motor Company was organized recently to include among its constituents the Little Motor Car Company and Chevrolet Motor Company, and it is anticipated that one of these concerns will undertake the manufacture of the new car. Further announcement will be awaited with interest.

GENERAL MOTORS' NEW HEAD.

Life History of the Man Who Will Direct the Destinies of Big Factory Group.

Charles W. Nash, who has succeeded Thomas Neal as president of the General Motors Company, Detroit, one of the largest, if not the largest, group of motor car producing factories in the world, was born near Dekalb, Ill., Jan. 28, 1864. At the age of seven, his parents having moved to Michigan in the meantime, he was bound out to a farmer in Flushing. By the terms of the agreement he was to receive a suit of clothes each year and to go to school three months in every 12. At the age of 21 he was to get two suits of clothes, both at the same time, and $200 in cash.

But the lad did not like farming, apparently, for he ran away at the end of the fourth year of service. At the age of 11, therefore, he began to learn the carpenter's trade with a salary of $7 a month. Later he secured a raise of $1 a month. At 18 he became a hay presser and at 21 he went back to farming, staying at it for seven years this time.

In the meantime he was married, and as Mrs. Nash's health was not good they moved to Flint, where he became a clerk in a grocery store. Not long afterward J. Dallas Dort of Flint wanted some plums picked and young Nash applied for the job. He picked plums so well that Mr. Dort gave him a job in the trimming department of the Flint Road Cart Company, then a small but thriving concern, which in later years developed into the Durant-Dort Carriage Company.

Charles W. Nash, President, General Motors Company.

At the end of six months he was made superintendent. It was a comparatively few years before he was vice president and director. In the fall of 1910 he was called to the general management of the Buick Motor Company of Flint, and under his leadership the company has increased its earning power with a rapidity which has surprised the industry. His selection to head the General Motors group, of which the Buick is but one of the constituents, is considered by his many friends throughout the country as a suitable recognition of true merit.

It may be permissible to add a word concerning Mr. Nash's personality. Back in the days when he knew his "boys" by daily contact with them, he took the time to inquire about the wife and baby and how things were going in the home. When he found the wolf showing his fangs he would call the man into his office and ask all about it. In the end perhaps it would mean a

Digitized by Google

small loan without interest, or a big loan, without interest, or the purchase of a house and lot to be paid for on the installment plan, also without interest. And it was years before anyone knew of the things he was doing. This is the first time anything about it has been published.

PRODUCING FEPS CARBURETOR.

Something About the Men Who Comprise the Schoen-Jackson Company.

The announcement of the Feps carburetor, which was described in detail in a recent issue of The Automobile Journal, has served to bring the Schoen-Jackson Company, Media, Penn., into prominence in the motor car industry. The concern is composed of Charles T. Schoen and M.

Members of Schoen-Jackson Company: At Right, C. T. Schoen; at Left, M. R. Jackson.

R. Jackson, two men who have had wide manufacturing experience.

Mr. Schoen is well known as the inventor of pressed steel cars and pressed and rolled steel wheels, for which over $7,000,000 have been paid by the railroads of the country. Since disposing of this business to the United States Steel Corporation he has been engaged in the manufacture of flexible metallic tubing. Mr. Jackson has been associated with Mr. Schoen in a business way for the past eight years. Upon him is devolved most of the active management in connection with the production of the tubing.

Some 20 years ago Mr. Schoen devoted considerable thought to the subject of carburetion and took out several patents on successful carburetors. Recently, J. L. Fritz, the young man who invented the Feps vaporizer, called Mr. Schoen's attention to his device and the latter was immediately impressed by its construction and design. The skilled mechanics of the Schoen-Jackson Company were invited to prepare the production for the market, and after more than 100 road and dynamometer tests the Feps carburetor made its appearance in public. That the company is convinced that the new vaporizer will meet the requirements of the motor car industry, particularly with reference to the use of low grades of gasoline, is borne out by the fact that a new plant, entirely apart from the tubing factory, has been constructed for its manufacture.

TO MANUFACTURE CROCE TRUCK.

Company Organized in Asbury Park, N. J., Will Manufacture Two Chassis Models.

The Croce Automobile Company, Asbury Park, N. J., has been incorporated with capital of $250,000, of which $50,000 is paid in, for the purpose of manufacturing the Croce truck. The incorporators are Louis P. Croce, designer of the new vehicle; T. Frank Appleby, formerly mayor of the city, and Harry A. Watson. Others interested in the company are Henry C. Winsor, Col. John W. Aymer, Stuart Appleby, Theodore Appleby, Richard W. Herbert, Samuel A. Reeves, Charles R. Zacharias, Charles Rugerber, Albert Robbins, E. W. Krymer and J. Voorhees Krymer.

The first story of a handsome two-story steel and brick factory building at First and Railroad avenues has been completed and it is expected that the second will be ready in February. It will contain 8000 square feet of glass, indicating that plenty of light will be a feature of the construction. The first floor will be devoted to chassis work and the second to the production of bodies. Two models will be made, one of 1500 pounds and the other of two tons. One of the former has been placed with Vogel Bros. Company of Asbury and one of the latter with the Wesley Engine & Hose Company of that city

RAYMOND CAR COMING.

Company Secures Factory Facilities at Hudson, Mass., and Will Begin Manufacture.

The Raymond Engineering Company, incorporated under the laws of Massachusetts in 1911, to manufacture, develop and deal in gasoline engines for marine, automobile, motor truck and stationary purposes; light, low-priced automobiles and delivery wagons, has occupied a large factory building at Lincoln park, Hudson, Mass.

Digitized by Google

The firm has capital of $150,000 and H. M. Warner is to be superintendent of the factory operations.

A. B. Raymond, M. E., a graduate of Cornell University, and vice president of the firm of Swasey, Raymond & Page, is president of the concern and the board of directors include Mr. Raymond, E. V. Henderson and J. L. Donovan of Boston. Previous to his connection with Swasey, Raymond & Page, Mr. Raymond was in charge of the calculating department of the Wm. Cramp Ship & Engine Building Company of Philadelphia. The knowledge gained in this experience resulted in the development of the "R-V" motor, now built in sizes from 10 to 160 horsepower; the Raymond runabout, a 100-inch wheelbase pleasure car of 25 horsepower, and the Raymond roadster.

DURANT HEADS CHEVROLET.

Plans Being Made to Perfect Organization to Take Care of Increased Demand for Product.

The board of directors of the Chevrolet Motor Company, Flint, Mich., maker of Chevrolet cars, has elected W. C. Durant president and J. Dallas Dort vice president of the concern. W. H. Little was chosen second vice president; Dr. E. R. Campbell, treasurer; Curtis R. Hathaway, secretary; F. A. Aldrich, assistant treasurer, and W. W. Murphy, assistant secretary.

It was announced that the company would take over the factory buildings of the Imperial Wheel Works, but it now appears that this will not be done for several months, as the Imperial company is still utilizing the buildings. However, a part of the plant, now being made ready, will be used by the Chevrolet company and plans are going forward to perfect an organization capable of caring for the output when manufacturing begins on a large scale.

RECEIVER TO SELL ASSETS.

Griswold, Ellis & Dickinson Secures Property of Wyckoff, Church & Partridge for $150,000.

The creditors of the bankrupt firm of Wyckoff, Church & Partridge, Inc., New York City, maker of Guy Vaughn cars and Commer trucks, at a recent meeting accepted the offer of Chester Griswold, George A. Ellis and Howard C. Dickinson of the firm of Griswold, Ellis & Dickinson, of $150,000 for the assets of the company, and John S. Sheppard, Jr., the receiver, was given the power to transfer the property at that figure.

The appraised value of the assets is $171,000, but in addition to the $150,000, the receiver has about $40,000 in cash on hand. There are about 800 creditors and the known unsecured claims amount to about $575,000, not including unliquidated or contingent claims. The terms of the sale are said to provide for payments of $50,000 in four, eight and 12 months respectively.

NEW REPUBLIC RUBBER OFFICERS.

Board of Directors Fills Vacancies and Considers Other Details of Management.

At the directors' meeting of the Republic Rubber Company, Youngstown, O., the following officers were elected: First vice president, L. T. Peterson, to succeed L. J. Lomasney, deceased; second vice president and director, succeeding L. T. Peterson as second vice president, John H. Kelly; director to fill remaining vacancy on the board, A. H. Harris.

In addition to his work as general sales manager, Mr. Kelly, as second vice president, will co-operate with the president and other officers in the general matters of management.

MILLIONS FOR FACTORY EXTENSION.

United States Tire Company Planning to Expend Large Sums During 1913.

The United States Tire Company, New York City, which operates four big plants, announces arrangements for an expenditure of $3,000,000 in factory improvements and extensions during 1913. The Morgan & Wright plant in Detroit, which it owns, is to be doubled in both area and production. Ground has been broken for several new buildings and work will be rushed forward as rapidly as possible. Its employees, now numbering 2500, will be increased to 6000 when the improvements are finished. The output of the factory will be in excess of 5000 tires daily.

It is planned to erect 16 new factory buildings ranging in size from 2000 to 131,000 square feet. Among these will be a finely appointed laboratory, where the scientific experimental work will be carried on, several warehouses and at least a half dozen manufacturing buildings, the largest of which will be 230 by 60 feet and six stories high. A new power plant will also be installed, doubling the boiler capacity of the factory.

Digitized by Google

The United States Tire Company operates extensive rubber works in Indianapolis, Ind., Hartford, Conn., and Providence, R. I., and is increasing the facilties of all these plants to provide for the tremendous growth of the tire industry. At Indianapolis a building 80 by 170 feet and six stories high is being erected; at Providence another structure 75 by 300 feet and three stories high will be added, while at Hartford a fine new power house and power plant have been installed at a cost of more than $175,000.

WILL MAKE MOORE TRUCK.

Syracuse Concern Increases Capital and Purchases Building for Manufacturing Purposes.

The Palmer-Moore Company, Syracuse, N. Y., has increased its capital stock from $100,000 to $200,000 and will at once begin the manufacture of motor trucks in the plant of the Syracuse Stove Works in North Geddes street, which has been purchased by this concern. The following are the officers: President, T. G. Meachem; vice president, T. W. Meachem; treasurer, Charles L. Palmer.

For about two years the company has been experimenting with a two-cycle motor patented by Edward Moore and the perfected motor will be embodied in the new truck, which will be known as the Moore. It will be air-cooled in the lighter type of vehicle and water-cooled in the heavy type. The plant has been appraised at $76,000, covers 3.5 acres of land and is well located.

WESTINGHOUSE IN ACCESSORY FIELD.

Will Open New Plant Giving Employment to 400 Additional Workmen.

The Westinghouse Electric & Manufacturing Company, Pittsburg, Penn., is adding to its production of automobile accessories and will soon open a new plant for this purpose, which will employ 400 workmen. The outlook for the accessory product is said to be brighter now than at any time in the past.

The first floor of the former warehouse of the Bindley Hardware Company, at Shadyside, Pittsburg, has been taken over by the Westinghouse interests and the machinery has been installed. The plant will be in operation in a few weeks. Two hundred men and a like number of women will be employed at the start.

NAME CHANGED TO PALMER.

R. A. Palmer Becomes General Manager of the Reorganized Suburban Motor Car Company.

Randall A. Palmer, formerly organizer and general manager of the Cartercar Company, Pontiac, Mich., maker of Cartercars, has become vice president and general manager of the Palmer Motor Car Company, which is the new name of the Suburban Motor Car Company of Detroit, Mich. The plant which was being built for the Suburban company at Ecorse is partly completed and it is hoped to have the work finished by the first of the year so that manufacturing operations can be begun by the Palmer company.

Mr. Palmer will have entire charge of the engineering and manufacturing departments. He is also president of the Palmer-Bee Company, dealer in power transmission and power machinery. W. A. DeSchaum, who designed the Suburban car, will not be connected with the reorganized company. The plant has a frontage of 353 feet on the main lines of all the railroads entering Detroit from the South, and enjoys unexcelled shipping facilities.

FEDERAL DECLARES STOCK DIVIDEND.

Exclusive Manufacturer of One-Ton Vehicles Meets with Splendid Success.

The Federal Motor Truck Company, Detroit, maker of Federal trucks, has declared a stock dividend of $100,000 and a 10 per cent. cash dividend, according to an announcement recently made by General Manager Martin L. Pulcher. The company was incorporated only three years ago with capital of $100,000, and during that time the output of trucks has steadily increased. The first year 50 commercial vehicles were manufactured, while 135 were made the second and 750 the third. The output for 1913 is scheduled as 1500 trucks, but this may be greatly increased.

The company has been forced to move three times to care for increasing business and it now occupies the large and modern factory originally constructed for the Van Dyke Motor Car Company. Additions doubling the plant's capacity are planned for the near future. T. E. Reeder is president of the company; Edwin Denby is vice president, and Martin L. Pulcher, to whom is ascribed a large part of the concern's success, is general manager.

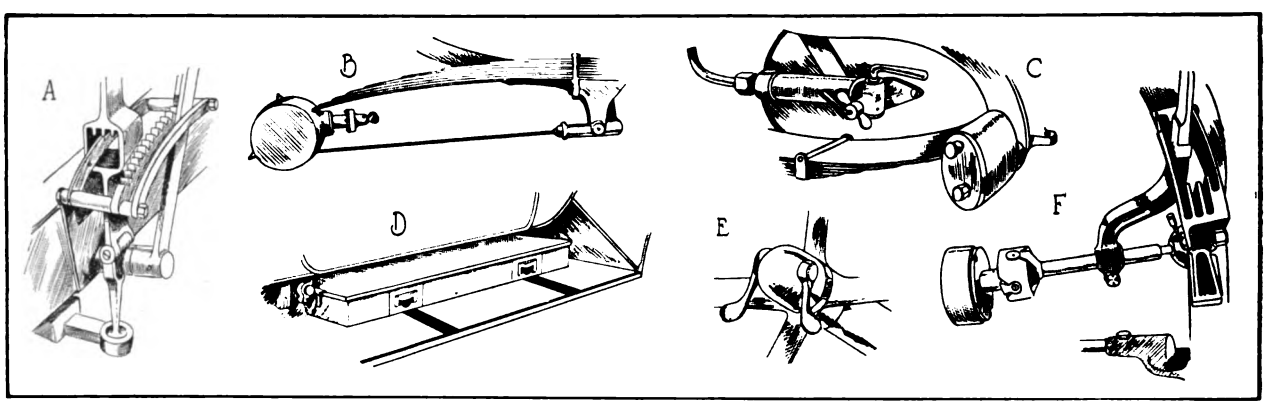
OLYMPIA REVEALS INTERESTING FEATURES.



Some Novelties in Mechanical Construction Which Appear on Foreign Cars—New Accessories That Are Making Their Appeal to British Motorists.

WHILE the recent motor car exhibition at Olympia, London, England, was the largest international showing of cars ever held, the number of completed vehicles and chassis on display was one less than at the first really big show in 1903, when 534 were exhibited. The reason for this is found in the fact that much of the space in the Annex was given over to accessories. However, the product of 153 separate concerns was on display and the international feature was decidedly strong. Ten countries were represented as follows: England, 71; France, 59; Germany, 16; Italy, 13; America, 12; Belgium, 10; Scotland, three; Austria, two; Switzerland, two, and Holland, one.

Perhaps an indication of the trend of design may be gained by examination of an accompanying table, which sets forth some of the main characteristics of the last three exhibitions. It may be added in passing, that at the show of 10 years ago 294 of the 534 vehicles were equipped with chain drive, while this year there were but five. In the Paris Salon of 1910 there were 59 cars thus equipped.

Briefly summarized, it would appear that the show indicated the following tendencies: The continued use of the long stroke, monobloc castings for four-cylinder engines and in sets of three for the six, successful efforts toward silence in poppet valve motors instead of developing the sleeve valve types, general accessibility of the motor and other components, application of motor starters, extension of four-speed transmission to small cars, hesitancy with respect to the worm drive, concentration of both brakes in the rear wheels, fitting of auxiliary springs and wider use of detachable wheels.

It is assumed that there will be more or less

Some Interesting Details Revealed at Olympia: A, Gateless Gear Change on Maudslay; B, Quarter-Elliptic Spring on Foy Steele; C, Combination Filter and Tap on Daimler; D, Sliding Tool Box on Lanchester; E, Control Levers on Steering Wheel on S. P. A.; F, Gate Quadrant and Gear Lever Shaft on Adler.

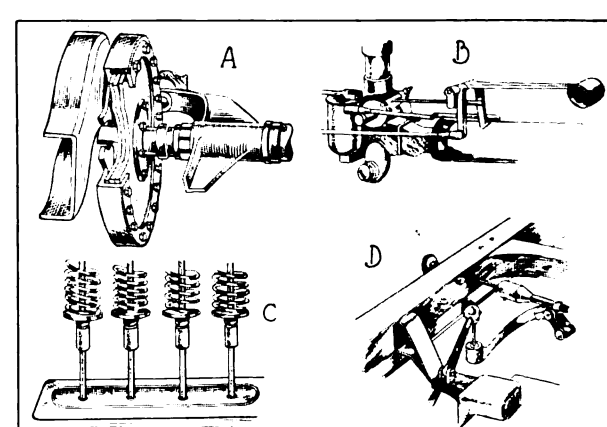
interest in some of the newer features which were brought to light at several of the individual stands, both among the cars and accessories. It

Mechanical Features on Foreign Cars: A, Nazzaro's Two-Jet Carburetor; B, S. P. A. Gate and Brake Quadrant; C, Wolseley's Gasoline Tank Filler Cap; D, Method of Driving Speedometer on Stoewer.

may be stated in connection with the latter, however, that there does not appear to have been the same activity in this field abroad that has been manifested in this country.

The matter of gear quadrants and gear levers is one which has caused considerable discussion among British motorists for some time. In this respect the arrangement on the Adler presents a rather ingenious design, in that the assembly is set at an angle to allow of using a tapering body front. As shown in an accompanying sketch a universal joint on the gear lever shaft permits the proper engagement of the various speeds. Another new form is found on the Maudslay, this being termed a gateless gear change, in which the gate may be said to be formed on the lever, which acts over a single quadrant. The S. P. A. has a gate which is spherical in shape, with slots for the various speeds cut therein. Attention also is drawn to the new form of control levers and their mounting on the steering wheel, with this car.

A new idea in spring suspension is noted on the Foy Steele. The front members are of the usual semi-elliptic type, but in the rear long quarter-elliptic springs are utilized. These contain a large number of leaves, and below the platform by which the spring is attached to the chassis is a bracket designed to act both as a torque and a radius rod.



Among the little details on the 1913 Daimler is the combined filter and tap on the gasoline tank. This not only permits of filtering the fuel on its way to the carburetor, but prevents the accidental escape of the fluid, inasmuch as the draw-off tap cannot be opened for drawing off fuel for priming purposes without first closing the regulation fuel tap.

A refinement which will appeal to many motorists is the sliding tool box on the footboard of the Lanchester cars. When not needed this is half-hidden away underneath the body, leaving the entrance to the front seat free of all obstructions. When occasion requires, the whole box is moved outward in suitable grooves in the footboard, which forms a convenient rest while utilizing its contents.

The Stoewer presents a decidedly new method of driving the speedometer. From a pulley cast integrally with the universal joint casing on the propeller shaft, a spring belt leads to a similar pulley on the end of the flexible speedometer shaft. The proper reduction serves to give the correct speedometer reading, and in addition the flexible shaft is entirely concealed within the body of the car.

The two-jet carburetor employed on Nazzaro is distinctive, in that the mixing chamber is actually within the valve tappet chamber, where it is assured of securing a good supply of warm air to aid in vaporization. The float chamber is completely outside the tappet chamber and the air inlets to the latter are covered with gauze filters.

Another fuel tank suggestion is found on the Wolseley. The tank itself is located at the rear of the chassis, which is a new departure with this make of car, and the filler cap is held in place by a simple locking bar. While it is maintained that this lock can be undone easily with the fin-

Additional Foreign Mechanical Features:. A, Isotta-Fraschini's Universal Joint; B, Withers' Balance Weight; C, Panhard's Valve Tappet Trough; D, N. A. G.'s Brake Pedal Adjustment.

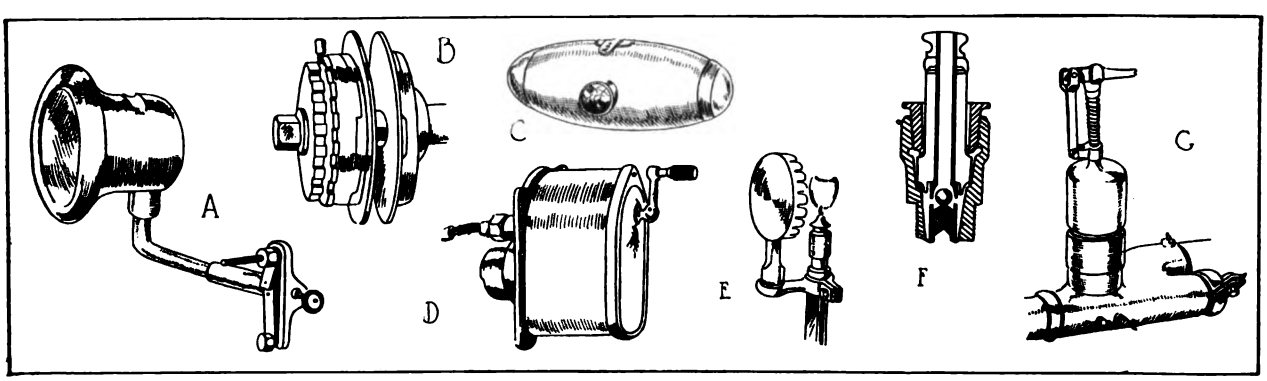
gers, it is held to give a pressure tight fit in the simplest possible manner.

The propeller shaft universal joint on the

Digitized by Google

Isotta-Fraschini comprises a three-ply leather disc bolted at the centre to a flanged extension on the propeller shaft. At the outer edge the leather is bolted to a larger metal disc on the end of the gearshaft. In the event of the leather becoming worn the drive can be taken temporarily by a form of dog clutch consisting of two steel tongues which pass loosely through holes in the large metal disc. The accompanying sketch presents the assembly in part section, showing the leather disc and one of the steel tongues.

A particularly interesting feature of construction is found on the Withers. Instead of utilizing the customary spring for returning the throttle pedal, a balance weight is employed. The sketch brings out the necessary details.



A small oil trough is fitted on the Panhard engine, through which the valve tappets pass. The object is twofold, for not only is the oil which works up from the crankcase collected and made to serve a useful purpose, but it is prevented from running to waste down the side of the engine and helping to cause a dirty appearance of the unit.

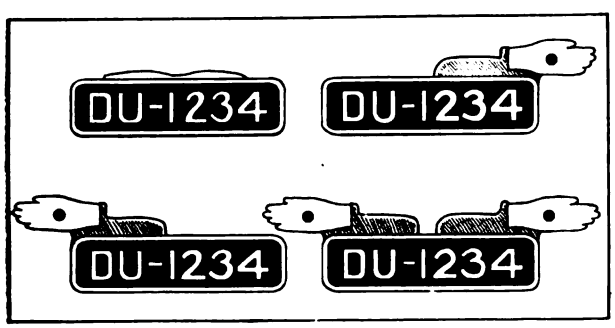
An example of the methods employed for obtaining pedal brake adjustment is noted on the N. A. G. Here a small rod is carried outside the chassis frame, by means of which the tension of the brake is changed in a simple and efficient manner.

In view of the increasing interest in motor starters, the Bosch hand operated starting magneto attracted no little attention. For all practical purposes the device is a very small high-tension generator of the usual kind, but instead of being driven direct from the engine, it is arranged so as to be rotated by hand by means of a small crank, the instrument being mounted preferably on the dash. The current which it generates is directed to the high-tension distributor of the main magneto, from which it is carried in the usual way to the plug of the cylinder which is in a suitable firing position.

In addition to providing a means for starting without cranking, this magneto is made to lighten the labor of cranking when the engine is cold. Attached to the starting handle by a positive pin drive, which enables the handle to be slid into and out of engagement in the usual manner, is a chain sprocket which drives a flexible shaft through a smaller sprocket, the latter being connected with the armature of the starting magneto. This shaft is contained within a fibre tube, and the whole is hidden beneath the hood. The armature of the starting magneto is geared up six to one with the starting handle.

Some interesting developments in lamps also are noted. The Dublito intensifier is a device capable of being fitted to any lamp using the Mangin lens mirror and is claimed to increase the illuminating effect by 50 per cent. It consists of a convex lens placed in front of the burner, and its function is to collect the rays of light from the front of the flame and to reflect them on the lens mirror, whence they are directed dead ahead instead of being diffused sidewise and only partially forward.

Some New Accessories Seen at Olympia: A, Scrutiny Side Lamp; B, Jenatzy Detachable Wheel Hub; C, Bleriot Ovoid Electric Side Lamp; D, Bosch Hand Operated Starting Magneto; E, Dublito Intensifier; F, Ripidion Spark Plug; G, Ripault Exhaust Whistle.



The ovoid shape Bleriot electric side lamp is merely one illustration of the attractive designs offered for this purpose. The Scrutiny side lamp not only affords a means for holding the light, but permits the electric leads to be carried in a sightly bracket. Sockets at either end of the bracket permit of setting the lamp in any angle desired.

A sectional view of the Ripidion spark plug brings out its construction. It will be noted that the central electrode consists of a constricted tube, and below the constriction it is plugged with a piece of nickel steel, the lower end of

Digitized by Google

which forms the spark gap with the extension of the screwed body. On top of the plug is a steel ball, which acts as a valve and seats itself on the compression and firing strokes of the motor, in the inclined walls of the construction, below which is a ring of small holes. On the suction stroke the ball drops from its seating and allows a small volume of fresh air to be induced into the cylinder, thereby sweeping away any soot or oil that may have been deposited there, and at the same time cooling the points. It also is claimed that the small admixture of air improves carburetion.

The hub of the Jenatzy detachable wheel is furnished on its inner and outer flanges with a series of sector shaped dogs which fit, one into a suitably formed plate on the end of the driving shaft and the other into a washer which slips onto the hub and into which a conical locking ring is thrust, an additional locking ring being on

Novel Signalling Device Designed by C. J. Humphreson of Coventry, England.

the outside of this. Between the two is a safety catch, which falls into one of the notches when the detaching spanner is used. When twin tires are utilized the hub is lengthened and is made of such size as to permit of placing two complete wheels in position together. A serated washer is interposed between their hub flanges so that the single locking device serves for both.

A new type of exhaust whistle is noted in the Ripault. The gases are directed to the whistle dome by means of a butterfly valve actuated by a vertical plunger through a lever movement and a Bowden wire. The note produced by the instrument is susceptible of variation by merely screwing the whistle dome down upon its spindle so as to bring its edge nearer to or further away from the angular jet of the tube, through which the exhaust gases issue.

C. J. Humphreson of Coventry, England, has brought out a new signalling device, which presents interesting features. The identification plate is of the box form and contains, anchored by toggle levers and held out of sight by springs, two hands, either or both of which can be drawn out by cords manipulated by the driver, but which return to their original position so soon as the cord is released. The idea is to indicate to other users of the highway whether the driver intends to turn to the right or left, or stop. In the latter instance, both hands are shown. Each hand bears a reflex light for use after dark.

No attempt has been made herein to review all of the developments brought to light at the recent show, but rather to present in a brief manner some of the features which cannot help but interest motorists on this side. Some of these new ideas must be regarded as innovations which have not been tried out thoroughly, but they serve to indicate the study that is being devoted to these matters abroad.

ADOPTS TRUFFAULT-HARTFORD.

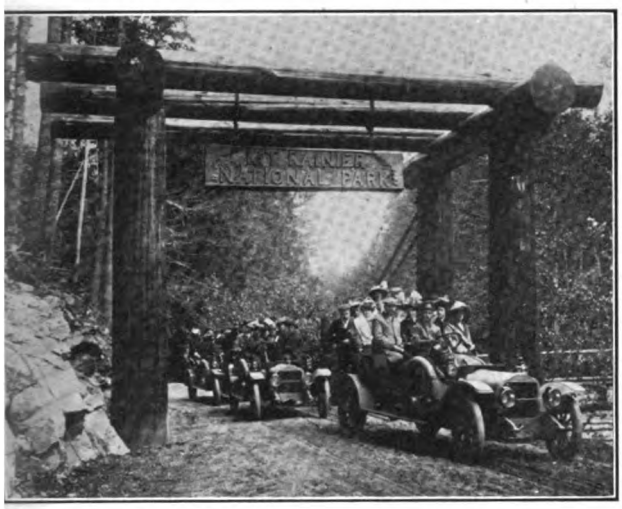
Well Known Shock Absorbers Become Regular Factory Equipment on National.

Announcement is made that the National cars will be equipped with Truffault-Hartford shock absorbers by the factory in the future, the maker, the National Motor Vehicle Company, Indianapolis, Ind., having closed a contract with the Hartford Suspension Company, Jersey City, N. J., to furnish these devices for all vehicles. This adds still another concern to a long list.

It is maintained by the Hartford Suspension Company that probably no other factor means so much to the car owner as comfort. Truffault-Hartford shock absorbers are held to give ideal riding comfort, and with them it is claimed every road becomes a boulevard.

HARTFORD'S BIG SHOW.

Sixth Annual Display of Dealers in Connecticut's Capital in February.



The Hartford Automobile Dealers' Association, Hartford, Conn., will hold its sixth annual display of motor cars, parts and accessories in the state armory, Feb. 8-15. This season the dealers will be assisted in the management of the exhibition by the First Infantry, C. N. G.

F. W. Dart, who has been in charge of the arrangements for past shows, will head the dealers' committee again this year. He is now engaged upon trying to find room for all who desire to make display, and even with the space available in the new armory it begins to look like a formidable task.

Digitized by Google

WHITE CARS IN MT. RAINIER PARK.

THAT American motor car manufacturers have been prepared to meet every emergency that the demand has created, undoubtedly

Party of Tourists Ready to Take Trip Through Mt. Rainier National Park in White 'Buses.

is the real secret of the industry's development. Probably one of the hardest tests to which privately owned cars or trucks have been subjected is in the service rendered by five White 'buses with the Tacoma Carriage & Baggage Company, Tacoma, Wash., during the past season.

This company has operated these five cars in Mt. Rainier national park, and each has made an average daily mileage of 54. The total number of persons carried has been 12,000. The gasoline consumption has figured out to very nearly 13 miles to the gallon. Considering that these vehicles were fitted to 1500-pound delivery wagon chassis, with sight seeing bodies carrying 10 passengers, and that the roads are in mountainous country, this economical feature alone is worthy of decided comment.

Accompanying illustrations show tourists enjoying the beauties of the park in these vehicles. Particular mention should be made of that in which the big trees are presented. Some idea of the size of these trees can be gained from comparison with the cars winding in and out among them in the lower picture.

It is stated by the company that at the end of the season not one of the White 'buses showed the slightest trouble, and that mechanically they were as good as new. So well pleased is the owner that the equipment will be increased materially before next season.

Tourists in Heavily Wooded Section of Mt. Rainier Park—Size of Trees May Be Judged in Comparison with 10-Passenger White 'Buses.

SATISFIED WITH GOODYEAR TIRES.

Florida Owner Always Has Obtained Big Mileage from This Make of Casings.

F. A. Hardee of Tallahassee, Fla., in a letter to the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, relative to service of a tire he purchased of the company, makes this comment: "I am sending you by express, a casing that has given me a mileage of 14,819 miles. I consider this the best mileage that I have or will ever get out of a tire. If this one casing had given me this service and I had not received good service or mileage out of the other casings of your make I have used, I would attribute this one instance to pure luck, but allow me to say that with the proper inflation which I am always careful about, there has not been a single instance in which I have not secured good service from your casings."

CARE OF CAR IN COLD WEATHER.

There are certain precautions that should be observed by motorists in cold weather. The fact that the radiator has been filled with an anti-freezing solution does not necessarily mean that no further attention is required. The solution ought to be examined from time to time to note if the freezing temperature has not been raised, especially if alcohol has been employed and the car operated on a warm day.

Those who garage their machines in cold buildings or expose them over night, when visiting in the country for example, will do well to

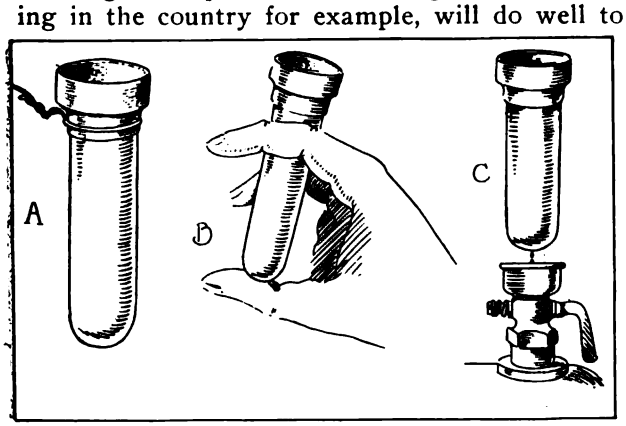

Fig. 1—Priming Suggestions: A, Illustrating Dust Cap and String for Securing Fuel from Tank; B, Perforated Cap and Method of Holding; C, Showing Thumb Removed and Gasoline Dripping Into Priming Cup.

examine the machine previous to attempting to start the motor as the fluid may have become frozen owing to a low drop in temperature. It is an excellent plan to unscrew the radiator cap and note if the solution has become congealed, and if it cannot be seen, owing to a loss of fluid, open the petcock under the radiator or water pump. Before coming to the conclusion that the circulation system is frozen because the water does not flow, run a wire through the petcocks to make sure that they have not become clogged with dirt. These precautions may save considerable damage in starting with a frozen machine.

STRAPS FOR SECURING BAGGAGE.

When a large quantity of baggage is to be carried in the car and the trunk rack and tonneau are well filled, it becomes necessary to utilize the running board. When the baggage is attached by means of straps it is difficult to secure these members without the luggage shifting. At Fig. 2 is illustrated a simple method of employing two loops of cord through which the straps are passed after being placed under the running board and before being secured around the package. This will keep the straps up snugly against the luggage which is thus prevented from moving.

INTERCEPTING UPWARD RAYS.

The average motorist has experienced the difficulty of operating during a fog with the head lamps lighted. Under these conditions the upward rays of the lamps illuminate the fog, just as light thrown on a piece of transparent gauze makes it apparently opaque and renders objects behind it invisible. The bright illumination causes the iris of the eye to contract, making it impossible to distinguish objects on the road. All ordinary headlights throw a considerable amount of illumination upwards, which is invisible on a clear night, and these rays are what cause trouble on foggy and misty evenings.

In England considerable experimentation has been made to overcome these difficulties and one maker of lamps recommends the use of tinted glass or gold reflectors, as red rays penetrate a fog much better than others. But it is pointed out that the utilization of colored glasses does not increase the red rays, but merely shuts off

Digitized by Google

all or some of the other rays, and that the fog will still be illuminated in front of the driver's sight, although with a red or yellow tint instead

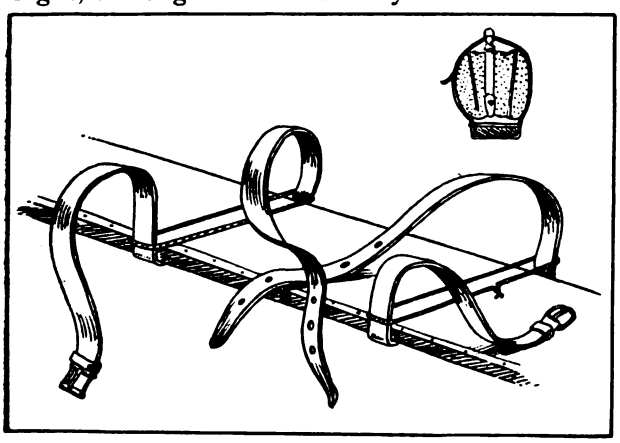

Fig. 2—Illustrating Use of Cords and Straps to Retain Baggage on the Running Board.

of a white or the more powerful rays of light.

Lodge Bros. & Co., London, England, maker of electric lighting equipment for motor cars, manufactures a special fog bulb which is shown at Fig. 3 B. An opaque patch is provided on the bulb itself, preventing all upward light and with a minimum loss of illumination as the patch is bright on the inside. A long distance beam and a wide angle beam for the sides of the road are as powerful as before and it is stated that no upward rays are projected above the level of the lamps, this point being indicated at D.

The same effect may be secured with either electric or acetylene lamps by the use of a disc cut to the pattern shown at A. It may be made from black cardboard in the case of electric lamps, or of metal for acetylene lights. It will involve the loss of a certain percentage of the light but the upward rays will be eliminated.

PRIMING SUGGESTIONS.

The majority of owners make it a practise to carry a cup of gasoline in the car for priming purposes in cold weather and especially if the machine is to be exposed any great length of time. If by accident the can becomes overturned so that the fluid leaks out, and the tank is not equipped with a petcock for renewing the supply, one must exercise his ingenuity.

At Fig. 1 A is presented a suggestion in such an event and the method of operation is very simple. Remove a dust cap from the valve stem and tie a piece of string to it as shown in the drawing. If string be unavailable a piece of wire will serve as well. Unscrew the filler cap and lower the cup into the fuel. Enough gasoline will be obtained to prime two or more cylinders.

At B is a simple kink of converting a dust cap into a priming member. A small hole is drilled in the closed end of the cap and when the device is to be employed the thumb is held over the aperture. The fuel may be secured from the filter or petcock. At C is shown how the fluid will drop into the priming cup when the thumb is removed.

FILTERS REQUIRE ATTENTION.

It is an excellent plan to make a practise of opening the filter in the fuel line or under the tank from time to time and drain off any water or sediment that may collect. This is especially essential in cold weather, as if too much fluid accumulates in the filter, it is likely to freeze and shut off the flow of fuel from the tank.

STARTING FROZEN VALVE CAPS.

In preparing for the grinding in of the valves the novice sometimes experiences difficulty in starting the valve caps which have become frozen. This is especially true if the repairman has utilized shellac to obtain a tight joint. When the usual wrench fails to move the stubborn cap, start up the motor and let it become warm. Then pour a little cold water in the recess of the cap. The heat will expand the metal and the water

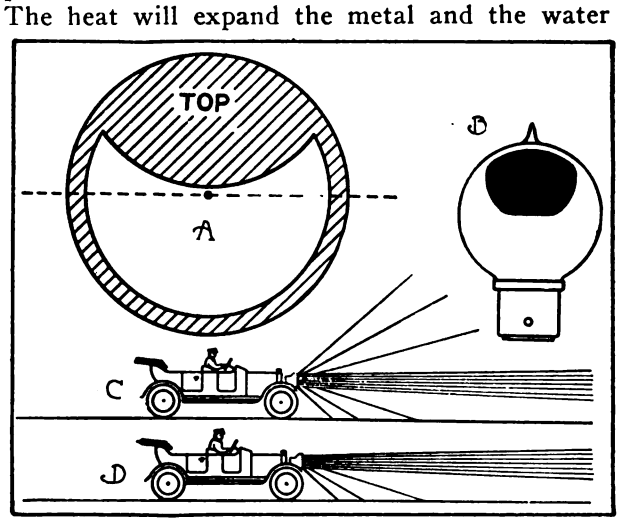

Fig. 3—Illustrating How Upward Rays of Headlights In Fog May Be Eliminated: A, Disc for Intercepting Rays; B, Lodge Patch Fog Bulb; C, Showing Upward Rays; D, Application of Disc.

will contract it enough to permit of easy starting. In replacing the caps smear the threads with graphite.

STORAGE BATTERY TREATMENT IN WINTER.

LIGHTING motor cars by electricity has been responsible for many improvements in storage batteries, particularly those especially designed for lighting purposes. The objection of some motorists to the early forms of storage batteries as a source of lighting current has been overcome by the manufacturer and the modern types give efficient service at a minimum cost of upkeep, provided the instructions of the maker are observed.

Although the great majority of owners operate their machines the entire year, there are some motorists who store their cars during the winter months and when the automobiles are fitted with electric lighting and motor starting equipment, it is essential that the batteries be given proper attention. Neglect to prepare them for a

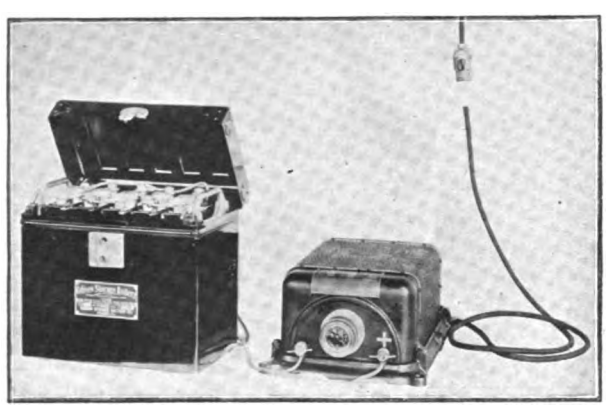

Fig. 4—The Edison Alternating Current Rectifier for Charging Storage Batteries.

long period of inactivity is liable to be the source of considerable annoyance and expense when the machine is again placed in commission in the spring. A little precaution is the best kind of insurance.

With the modern battery constant service is held to be beneficial and this is demonstrated by the large number of cars equipped with lighting systems, these including a dynamo or generator for maintaining the battery in a properly charged condition. It is held by electrical experts that a battery must have the required current forced through it periodically and that the charging as performed by the dynamo on a motor car is beneficial, as overheating is prevented by the freedom of gas bubbles, the vigorous air circulation and the intermittent character of the charging. Occasional overcharging, but not exceeding the normal ampere rate, is also held to be of value, and liberal guarantees are made by the manufacturers.

On the other hand, the battery will deteriorate rapidly if taken from or allowed to stand in the container for any length of time without attention. The Willard Storage Battery Company, Cleveland, O., maker of the LBA batteries, which are utilized in several lighting systems, states that in order to maintain a storage battery at its proper efficiency it is necessary to give it a charge at certain intervals. It is suggested that when the charging is done by the dynamo, on the car, the engine should be run and the battery charged to its full capacity. This should be done at least every two weeks and the generator operated until the battery is up to its capacity.

To obtain best results a specific gravity hydrometer should be purchased for testing the solution. These are not expensive and comprise a rubber bulb syringe, a calibrated hydrometer and a small glass case for the solution, which is drawn from the cells by the syringe. The operation is simple and anyone can take readings of the electrolyte.

If the generator is operated once every two weeks and run until the gravity of the solution is up to 1.280 degrees, as indicated by the hydrometer, it is stated that it will not be necessary to run the engine more than an hour. When no hydrometer is available it is suggested that the motor be operated two or three hours as this will insure the battery being fully charged. The utilization of the hydrometer is recommended, however, as it is not only safer, but more economical of fuel. In charging the motor should be run at a rate corresponding to about 20 miles an hour car speed.

Charging by Rectifier.

As it is not always convenient to operate the motor every two weeks, due to the car being stored in a cold building and with the water drawn from the circulation system, it is recommended that a small rectifier be purchased, if the available current be alternating, or a charging apparatus if it be direct. There are several of these devices being marketed at a reasonable cost and many are constructed for attachment to the walls and provided with an ordinary electric light socket for connecting to the main line. With one of these it is a simple matter to give the battery an overnight charge about every two weeks. The hydrometer should be used as previously outlined.

Digitized by Google

The Willard Storage Battery Company strongly recommends that a battery be charged by the dynamo on the car when possible. If, however, the owner does not care to purchase charging apparatus or bother to start up the motor, it is suggested that the battery be removed from the car and sent to a service station having proper facilities for caring for it during the period of inactivity. It should be stipulated, however, that it be given a charge every two weeks and in accordance with the instructions of the maker. The expense will be nominal and will prove an excellent insurance, in that the battery will be in first class condition when its service is again desired.

Charging Batteries.

In charging batteries the instructions of the maker should be followed carefully. The positive and negative poles are marked and it is important that these be connected properly. The charging rate should be observed, although with some of the charging devices all that is necessary is to connect the leads properly and turn on the current, as with the Edison alternating current rectifier shown in an accompanying illustration. This type is easily operated, is constructed for 110 or 220-volt circuits and has a connecting plug and a snap button type of switch.

Before attempting to charge a battery it is essential that the vent plugs be removed and that the cells be examined to note if the electrolyte covers the plates. If not, pure distilled water should be added. Ordinary water must not be employed as it will injure the plates. It will usually be found that some water must be added as there always is a certain amount that evaporates.

Care of Delco System.

The Dayton Engineering Laboratories Company, Dayton, O., maker of the Delco lighting and starting system, advises that in the event the machine is laid up for the winter the battery either be removed and sent to a battery station where it will be cared for properly, or that the engine be run for a couple of hours each month. A meter is provided in the battery box and before starting the engine the indicating hand should be set back to 70. This gives the battery the necessary overcharge. Distilled water should be added when the perforated plates are discernible, just enough to cause the fluid to pass through the holes in the splash cover. The condition of the water may be noted by examining the opening of the vent tube. The company does not advise the use of acid or the service of a voltmeter to ascertain the condition of the battery.

If it is impossible to send the battery to a station or charge it by the generator on the car, after being fully charged it should be removed and placed in the house where the temperature is moderate. It should be covered to keep out dust, etc., and if kept in the box the latter should be covered. Relative to storing batteries, the Willard Storage Battery Company recommends that the minimum temperature be about 40 degrees Fahrenheit.

Ignition Batteries.

As many cars are equipped with the ignition or sparking type of battery the following suggestions will be of value in putting these away for the winter: They should be fully charged according to the rate recommended by the maker. If the work is performed by the owner and the identification marks have become obliterated, the poles may be determined easily by immersing the leads from the battery in water containing about 10 per cent. vinegar or other acid. A few bubbles will arise from the positive wire while the negative will give off larger bubbles very actively. The wires should be held apart in the test and upon determining the leads the terminals of the battery should be marked positive + and negative —.

After charging the acid should be emptied from the cells and the latter refilled with distilled water. Allow the fluid to remain for several minutes, after which it should be emptied. Repeat the operation three times and about a day apart. Drain the cells dry and put the battery away in a dry place where it cannot freeze. The rubber vent plugs should be removed to allow ventilation of the cells.

Another method is to give the cells a monthly charge at a medium rate until they gas freely. Especial attention should be paid to the electrolyte, which should not be allowed to fall below the tops of the plates, so as to leave any portion of the plate exposed to the air. The above treatment is recommended by the United States Light & Heating Company, New York City, maker of the National battery, and it is pointed out that the battery will always be ready for service, but on the first discharge will not give the usual normal mileage.

The care of the battery is important and by following the instructions of the maker, the owner will obtain maximum service at a minimum cost of maintenance. All manufacturers issue comprehensive directions for the care and operation of batteries, which will be forwarded free upon application.

THE LITTLE ARISTOCRAT EMPIRE.

General Manager Fay Lets Children of His Neighborhood Enjoy Its Possibilities.

F. L. Fay, general manager of the Empire Automobile Company, Indianapolis, Ind., has two hobbies—motor cars and children. One day recently his three small children gave a neighborhood party and Mr. Fay appeared on the scene with his Little Aristocrat Empire, to give the guests a ride. The task was accomplished in two installments.

Although the Empire is manufactured and sold as a five-passenger car, he proved that its capacity is considerably underated by carrying 27 children at one time for a six-mile jaunt. The second load consisted of four mothers and 10 little tots who could not find even a toehold for the first trip. Mr. Fay declares the Empire was especially designed for old fashioned families, and proves it by the accompanying illustration.

F. L. Fay, General Manager, Empire Automobile Company, Entertaining His Little Friends in a Little Aristocrat Empire.

DETROIT DEALERS SECURE SPACES.

Sixty Exhibitors Will Display Cars and Accessories at Twelfth Annual Show.

Sixty firms drew for space for the 12th annual automobile show of the Detroit Automobile Dealers' Association to be held at Wayne Pavillion and Annex, Detroit, Mich., Jan. 27-Feb. 1. Of this number 43 will exhibit automobiles while 17 will display parts and sundries. The former will represent at least 60 different manufacturers The show arrangements are in charge of President W. F. V. Neumann and Manager Walter Wilmot, assisted by numerous committees. The following are those who received allotments of space:

Abbott Motor Company, Buick Motor Company, Bemb-Robinson Company, Baker Electric Company of Michigan, Cartercar Company, Cadillac Motor Car Company, Cunningham Auto Company, Century Electric Sales Company, Detroit Hupmobile Sales Company, Detroit Electric Garage, Ford Motor Company, General Motors Truck Company, Grant Bros. Auto Company, K-R-I-T Motor Car Company, Post-Fair Motor Sales Company, W. J. Marshall Auto Company, Neumann-Lane Company, Olds Motor Works, Overland Motor Sales Company, Oakland Motor Car Company, Regal Motor Sales Company, J. P. Schneider, Seigel-Zeckendorf, Seidler Sales Company, Standard Auto Company, P. W. Schulte & Son, Studebaker Corporation, Thompson Auto Company, Winton Motor Car Company, M. A. Young Company, Chas. E. Miller, Barber Motor Sales Company, Automobile Equipment Company, Sewell Cushion Wheel Company, Esco Auto Lock Sales Company, Hand Corporation, Havers Motor Car Company, Indiana Refining Company, National Refining Company, Grinnell Electric Company, Cleveland Hardware Company, Murphy Power Company, Travellers Motor Car Company, Chevrolet Motor Company, Armitage Enamel Leather Company, Cleveland-Galion Motor Truck Company, Edward G. Budd Manufacturing Company, Punctureless Tire Company, Wayne Oil Tank & Pump Company, W. Burdick, Paragon Refining Company, Samuel Davidson, Church Field Motor Company, Foster Motor Sales Company, Artemas Ward, R-C-H Corporation, Annett Auto Garage, United Motor Detroit Company, Warren Motor Car Company.

The latest special racing machine to go to a private owner is the Fiat, which Caleb Bragg piloted to victory in the Grand Prize race at Milwaukee, Wis. This has been purchased by Vincent Astor, now in possession of the Astor estate.

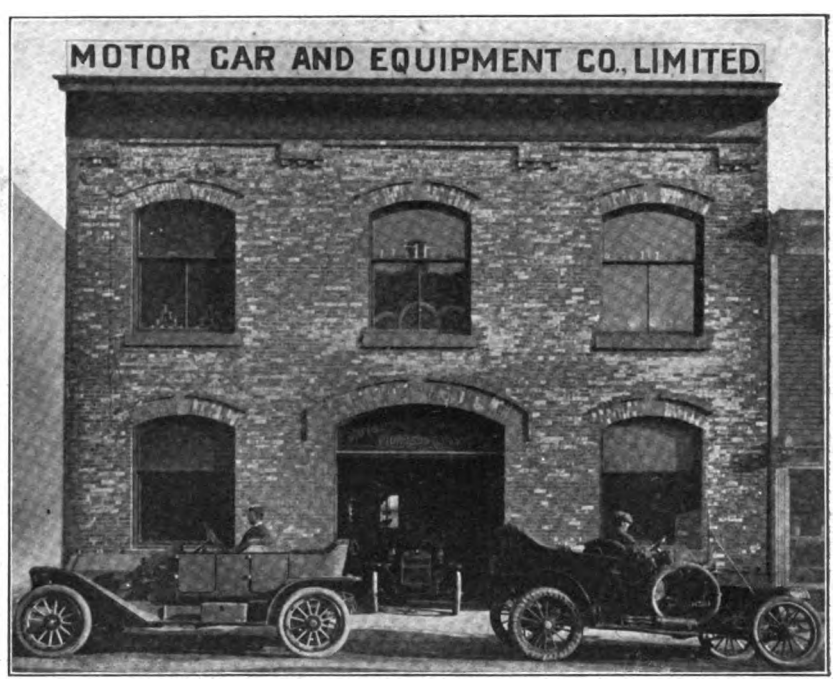
MOTORING CONDITIONS IN NEW BRUNSWICK.



WITHIN the past year the number of automobiles in use in New Brunswick, Canada, has increased over 100 per cent. The New Brunswick Automobile Association, which had been permitted to exist practically in name only, has elected a new set of officers, included among whom are some of the most influential men in the province, and its future programme is one modelled somewhat after the activities of similar bodies in the United States. At least one motor car factory is in process of erection, and the motoring situation, with reference to business for 1913, is decidedly promising from every aspect.

While Fredericton is the capital of the province, it is an inland city, and it may be assumed that St. John is the centre of the present organized effort to promote motoring in that section. St. John is within easy access of the provinces of Nova Scotia and Prince Edward Island, the former of which has but very few cars as yet and the latter none at all. While automobiles never were excluded from Nova Scotia, they have had little encouragement. Prince Edward Island gives every promise of removing the bann in the near future.

This situation explains in a measure the present activity looking toward the manufacture of cars, since St. John offers admirable shipping facilities to each of these neighboring provinces. It also accounts for renewed activity on the part of the St. John dealers, all of whom are making plans for increased business in 1913. The contract has been awarded for one splendid new garage and service station at Germain and Princess streets, in the heart of the city, and every effort will be made to attract and retain custom.

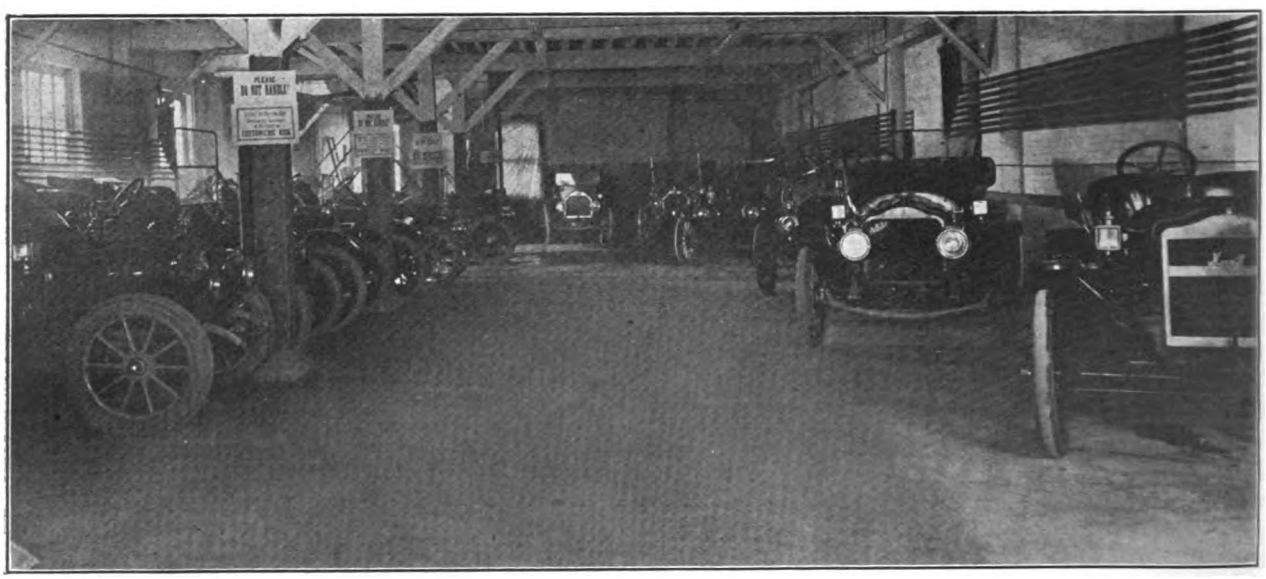
The New Brunswick Automobile Association is to have its headquarters in this building, and it will be from this location that the campaign for good roads will be continued. The word is used advisedly, since some results already have been obtained. Tourists visiting eastern Maine have crossed over the border in years past with a view to visiting St. John and some of the other scenic points along the Bay of Fundy and beyond, but they have been impressed unfavorably by the lack of proper touring facilities. After reaching St. George, 32.7 miles from Calais, Me., and St. Stephen, N. B., a detour of some 25 miles has been necessary in order to avoid some five miles of desolate and impassable country over the old post road between St. George and Lepreaux.

After much persuasion upon the part of the New Brunswick Automobile Association, the townships between St. George and Lepreaux have united in the construction of a splendid gravel road over the old post road layout. This is practically completed and will be available for all tourists in the spring of 1913. As a result, it is anticipated that many more motorists will visit New Brunswick next year, particularly as Maine has been improving its roads through Washington county to Calais.

Exterior of the Princess Garage, Operated by the Motor Car & Equipment Company, Ltd., St. John, N. B.

It should be remembered that as yet the New Brunswick parliament has practically no jurisdiction over the highways of the province. The association hopes to convince the legislators that it would be wise for the government to assume charge of the matter, in view of the fact that motoring tourists will leave large sums of money in the province each year, and it is not unlikely that this situation will enter into the selection of

Digitized by Google



future members of parliament to a certain extent.

The new garage mentioned above is to be built for J. A. Pugsley & Co., one of the oldest automobile firms in St. John. Lockwood, Green & Co., Boston, Mass., is the architect, and when it is known that this concern drew the plans for the service station occupied by the J. W. Maguire Company, agent for Pierce-Arrow cars in Boston, it will be recognized that the structure is to be well adapted for the purposes to which it will be put. Its exterior largely will be of concrete and glass, particular attention being paid to the matter of supplying the interior with light.

J. A. Pugsley also is interested in the Maritime Motor Company, Ltd., which will occupy the factory now being erected. The location is on the line of the Intercolonial Railway and there

A major portion of the ground floor is utilized for storage of transient and regular service cars, and as a salesroom for demonstration machines. The office is at the left as the garage is entered. An electric elevator conveys the machines to the repair shop on the second floor, which is located at the rear of the building. The front of this floor is devoted to the storage of spare parts, supplies and accessories. All of the appointments are as complete and up-to-date as any modern garage in the States. It is but natural that the Motor Car & Equipment Company should have built up a good paying business, both in cars and supplies.

Mr. Coombs is very proud of his business methods, and it may be added that he has considerable reason to be. Transient trade is on a

Ground Floor of the Princess Garage,, St. John, N. B., Showing the Available Space for the Storage of Cars.

are direct connections with the Grand Trunk and Canadian Pacific. Plans for the first Maritime cars are nearing completion, and it is anticipated that they will compare favorably with those produced in other Canadian factories. Many of the components will be purchased from American makers, this having reference to the motor, axles, etc.

At present the principal garage in St. John, and in New Brunswick for that matter, is the Princess garage, operated by the Motor Car & Equipment Company, Ltd., at 110-112 Princess street, and of which F. W. Coombs is general manager. As may be noted from the accompanying illustrations, the building is of brick construction, two stories in height and the provision for lighting has been considered carefully.

strictly cash basis, and the system in operation is not unlike that in use in most garages of today. The transient tag is the same in form and contains the same items as that utilized in many cities in the United States. It is eight inches long by 3.5 wide, printed on stiff board, and is filled out and attached to the car when it is left by the owner or chauffeur. The lower portion is detached and becomes the owner's check for his machine. If it should develop that repair work is needed, the method of procedure is the same in every way as that which applies to the regular patron, with the exception of the payment of cash when the machine is delivered, and will be described later.

With the regular customer, cars are washed and polished at stated intervals, according to the

terms of the agreement. In case supplies of any nature are furnished, the owner or chauffeur is presented with a duplicate slip bearing the number of gallons of gasoline, etc., and the price. These may be retained for checking up with the bill, which is rendered by the bookkeeper twice a month.

Fig. 2 presents the bill sheet, which is made out in duplicate, the original on white paper, forming a part of a loose leaf ledger and the duplicate on yellow paper being forwarded to the customer. This is 11 inches high by 8.5 wide, and it will be noted that there is daily space for recording merchandise purchased, machinist's time for work done, and all the other items which go to make up the bill. At the end of the period for which the bill is rendered these items are carried out for each day and the grand total appears at the foot of the sheet. The entire transaction is thus spread out before the owner and garage proprietor, alike, and in such manner that there can be no questioning the bill. The slips retained by the garage and the duplicates of them presented to the owner or chauffeur at the time of each transaction should agree, and if for any reason they do not, the error can be detected and corrected at once.

No repair work is undertaken except upon order, and when it is begun, if additional work is found, the whole job is held up until the owner is communicated with and his wishes made known. This applies to the transient as well as the regular patron, since there is a space on the transient tag for the owner's temporary address in St. John, so that he may be reached by telephone should such occasion require. This obviates the possibility of misunderstanding.

Each morning the workmen are supplied with machine shop time cards, as indicated at Fig. 1. These are the same in size as the bill sheet and make provision for the recording of the work done by each man every hour of the day. The workman is required to fill out his card at the completion of each job. Each item is checked

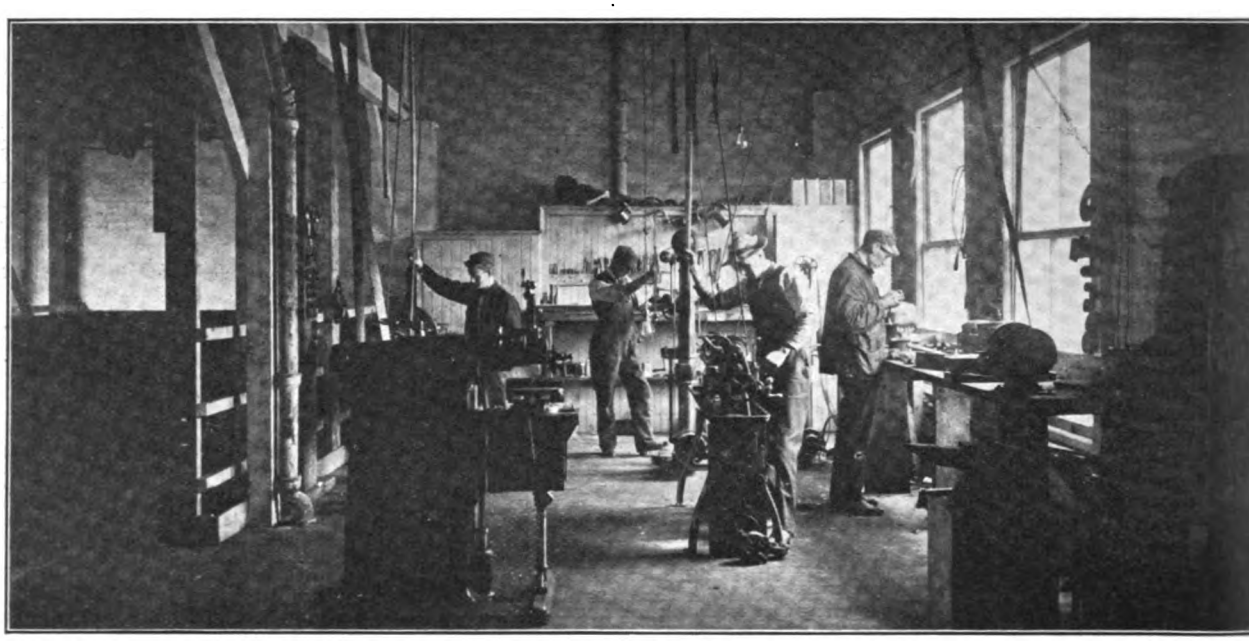
up by the foreman, and at the end of the day the sheet is signed by the machinist and foreman, and becomes a permanent record of the day's work. It is possible that this portion of the system could be improved by the addition of a time clock, but with this opinion Mr. Coombs does not agree.



All supplies and spare parts are under lock and key at all times, and are not available to any but those who have direct supervision over them. Each workman furnishes his own tools. Whenever new parts are needed it is necessary for the machinist to make requisition upon the foreman, who procures the part or signs an order for it. The entire system is simple and sufficient.

The character of repair work undertaken is somewhat more varied than that which is done by many garages in the States, since St. John is not within easy access of the factory which produces the car. It is possible to send to Boston, and await the arrival of parts by steamer or train, but in many cases it is found more desirable to undertake the necessary machine work at once in the company's own shop.

The company is agent for White cars, made by the White Company, Cleveland, O., and has been fortunate in creating a wide demand for this product. It also has taken upon itself to interest local merchants and business men in White trucks, or lorries, as they are termed in the British possessions, and three of these vehicles have been placed within a short time. These three trucks, with one other, a converted pleasure car, comprise the only commercial cars in St. John, and as far as is known, in the province.

St. John has an abundance of steep hills and some road surface which cannot be regarded as ideal for mechanical transports. However, the city government is busily engaged in resurfacing many of the principal streets, and it is anticipated that there will be little difficulty in interesting business men in motor trucks, particularly as the White machines have given every evidence of their ability to cope with the situation in the short time they have been in service.

It may be added in conclusion that work is progressing rapidly on the construction of docks and piers, the completion of which will mean that St. John is to become one of the most prominent trans-Atlantic ports in Canada. All this means much to the city and the province, and it also has its bearing upon the future of the motor car industry throughout that entire section.

Repair Shop of the Princess Garage on Second Floor, with Electric Elevator at the Left, Indicating Well Lighted Interior.

The annual banquet of the Bay State Automobile Association will be held the evening of Dec. 16 at the Copley-Plaza, Boston. The committee announces a number of widely known after dinner speakers, including one of the prominent manufacturers of the country, who will give facts about the motor car industry from a factory standpoint.

THE NEW KING MODEL.

Latest Product of Designer Bayerline Presents Many Attractive Details.

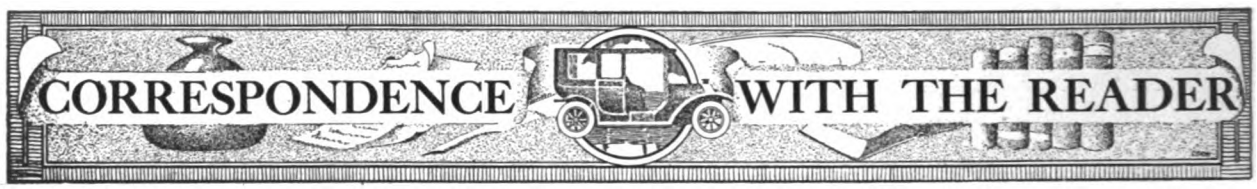
An accompanying illustration presents the new King model, designed by J. G. Bayerline, which will be shown to the public for the first time at the New York, Chicago and Detroit shows. In the car are the designer, Artemas Ward, who recently purchased the King Motor Car Company, Detroit, and others who will be prominent in the new concern which Mr. Ward is organizing to take over the production of these models.

The present line of King machines will be continued, the new model being an addition, to sell at a moderate price, fully equipped with electric motor starting and lighting system, and with specifications about as follows: Wheelbase, 111 inches; motor, 3.75-inch bore and 5.25 inch stroke; unit power plant, multiple disc clutch, full floating rear axle, very efficient brakes, left hand steering and centre control. Two bodies will be fitted—touring car and roadster.

Arrangements have been made to produce about 1000 cars before June 1. The following group of men will make up the personnel of the new management: General manager, J. G. Bayerline; factory manager, T. A. Bollinger (the man at the wheel in the picture); engineer, T. P. Chase; purchasing agent, J. B. Siegfried; sales department, W. L. Daly; division superintendents, J. S. Mohrhardt and C. C. Bollinger. In addition, F. A. Valbrecht will look after the accounting end and George C. Gurney the service department.

The Latest King Model: At the Wheel, T. A. Bollinger; Beside Him, Artemas Ward; Left to Right in Tonneau, Artemas Ward, Jr., T. P. Chase and J. G. Bayerline.

THE SECOND HAND CAR PROBLEM.



Metropolitan Dealers' Association Believes It Has Discovered a Satisfactory Solution.

Recently the Automobile Dealers' Association, Inc., of New York City, held several meetings relative to the second hand car problem and the situation that was developed proved somewhat startling to the dealers themselves, as many of them had not realized to what an extent this feature of the industry had grown. It was pointed out that many customers, having an old car to trade in on the price of a new one, managed to get the best of the dealers by bidding one against another, often forcing allowances on the old cars far in excess of their real market value. This resulted in a cut in the small margin of profit that should be received from the sale of the new car. The dealers frankly admitted the situation had arrived at a stage where curtailment was necessary or many would have to go out of business.

It was agreed that when customers have second hand cars to trade in, the dealer will take the car, place it on the floor, advertise it and endeavor to secure a customer for it at the best possible price. In the interim, if the customer signs an order for a new car and demands immediate delivery, he is to pay cash for it. When the old car is sold the money is given to the customer without any charge for disposing of his car. Should the old car be sold before the new one is delivered the proceeds can be credited on the new car. In this way the dealer makes a clean sale and except for the expenses of selling the customer's car, receives the profit on the new car to which he is entitled.

G. B. Joslin of Palouse, Wash., is enthusiastic over the performance of his Paige car, made by the Paige-Detroit Motor Car Company, Detroit. He states that he has covered 6000 miles without expending a cent for repairs. He adds that there was not a single puncture or adjustment to the car during that distance.

Cylinder Castings.

(1460)—In reading the descriptions of motors in your valuable magazine I notice they state that "the cylinders are of a special gray iron." What is the composition of these cylinders; that is, the materials? CURIOUS.

Richmond, Ind., Nov. 17.

By a special gray iron is meant its characteristics. In the manufacture of cast iron, derived from pig iron, the latter is graded, the most satisfactory method being that of chemical analysis. The following specifications for cylinder castings are those employed by a leading motor car manufacturer:

	Per Cent.
Silicon	1.25 to 1.60
Sulphur	less than 0.11
Phosphorus	0.50 to 0.80
Manganese	0.50 to 0.80
Combined carbon	over 0.40
Graphitic carbon	under 3.00

Kent gives the following formula for automobile cylinders:

	Per Cent.
Total carbon	3.17
Graphitic carbon	2.72
Combined carbon	0.45
Silicon	1.99
Manganese	0.39
Phosphorus	0.65
Sulphur	0.13

Carbon exists in three states in cast iron, namely: Combined carbon, which has the property of making iron white and hard graphitic carbon or graphite, which is not alloyed with the iron, but exists in it as a separate body, since it may be removed from the fractured surface of pig iron by a brush; and a third form, called by Lederbur "tempering graphite carbon," into which combined carbon may be changed by prolonged heating.

Combined carbon increases hardness, brittleness and shrinkage. Up to about 1 per cent. it increases strength, then decreases it. The presence of sulphur tends to increase the combined carbon in a casting, while silicon tends to change combined carbon to graphitic carbon.

Graphitic carbon in a casting causes softness and weakness when above 3 per cent., and softness and strength when added to irons low in graphitic carbon and over 1 per cent. in combined carbons. It increases with the size of the casting, with slow cooling, or rather with holding in the mold a long time at a high temperature.

Silicon acts as a softener, by counteracting the hardening effect of sulphur, by changing combined carbon into graphitic carbon; changes white iron into gray; increases fluidity and lessens shrinkage. The softening effect of silicon is modified by sulphur and manganese.

Sulphur causes the carbon to take the form of combined carbon, increases hardness, brittleness and shrinkage, and also has a weakening effect of its own. Manganese in a small amount, less than .05 per cent., counteracts the hardening influence of sulphur. In larger quantities it changes graphitic carbon into combined carbon, and acts as a hardener. Above 2 per cent. it makes iron very hard. Manganese combines with iron in almost all proportions.

Phosphorus increases fluidity, and is therefore valuable for thin and ornamental castings in which strength is not needed. It increases softness and decreases shrinkage.

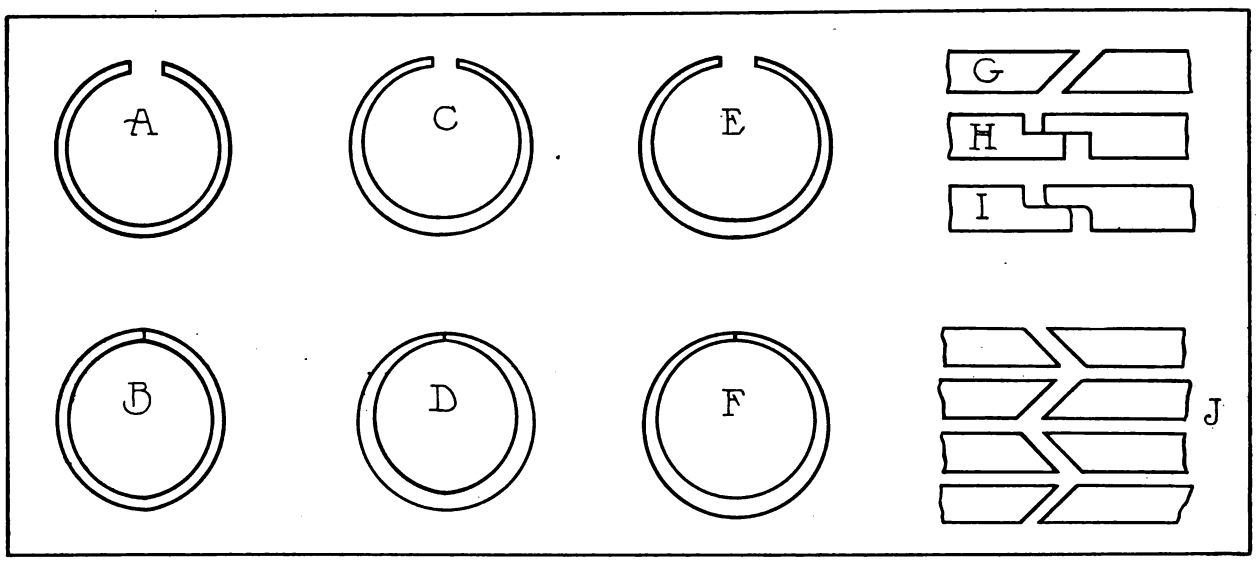
Piston Ring Construction.

(1461)—I note in your publication that reference is made to the piston rings as being cut concentric and eccentric and that emphasis is laid upon the method of finishing and fitting. What is the difference between the two types and what are the advantages of either, if any?

D. R. W.

Los Angeles, Cal., Nov. 26.

In the early days of motoring the maker did not give the same attention to the manufacture and fitting of piston rings as at present and during recent years these members have been perfected. They are without doubt one of the most important components of the motor, as poorly fitting rings result in the cylinder walls wearing oval, lost compression and heating of the engine, to say nothing of ignition troubles due to the lubricant leaking past the rings and fouling the spark plugs.



It is a generally accepted idea that if a ring be turned concentric inside and out and then split, the outward pressure on the cylinder walls, when the ring is closed and in its place, will not radiate from the centre. This is demonstrated in the accompanying illustration at A and B, showing the ring open and closed, respectively. It will be noted that with this design there are three bearing points, on either side of the split and at the lowest extremity of the circle.

Such a type would not be practical for service in a cylinder, so the ring is made thicker in the

Digitized by Google

first instance and then turned to a true circle after being closed at the gap, thus giving a full bearing surface all around its circumference. Before doing, this, however, some manufacturers make it a practise to turn out the inner periphery of the ring eccentric to the outer, in order to equalize the pressures at all points of the ring. This is depicted at C and D.

A ring of the eccentric type is shown at E and F and costs but slightly more to manufacture than the type previously described. It is turned to a perfectly true circle inside and out with the gap closed, the outer circle being eccentric to the inner. By referring to F it will be noted that not only are the pressures even on all parts of the ring, but less pressure is required to make it gas tight. It is held that there is less uneven wear of the cylinder walls, less heat de-

Outlining Piston Ring Construction: A, Concentric Type, Open; B, Closed; C, Eccentric, Open; D, Same Closed; E and F, Eccentric Ring Finished to True Circles Inside and Out; G, H and I, Showing Different Steps; J, Diagonally Cut Rings Arranged Oppositely.

veloped and greater efficiency of the motor.

Relative to joining the rings there are various methods, some of which are illustrated at G, H and I. That at G consists of a diagonal cut across the face. There is a tendency of this type to rotate in the direction opposite to that in which the lower diagonals point, and some make it a practise to cut every other ring in the opposite direction to its neighbor, as shown at J.

Another method is to step the rings as indicated at H, while that at I depicts the plan of leaving a radius of metal at the root of the step. An important factor in rings is the accuracy of the fit in the groove. Manufacturers today pay especial attention to the construction and fitting rings, accounting for efficiency of modern motors.

Melting Point of Aluminum.

(1462)—Will you please advise me if there is any way of melting aluminum at home? I have tried it on the gas stove with an iron pot. The latter turned red hot, but the aluminum did not melt. PERRY.

Fall River, Mass., Nov. 26.

The melting point of aluminum is 1215 degrees Fahrenheit and this temperature cannot be obtained with an ordinary gas stove. If a casting is desired it should be made in either a dry or "green" sand mold, or in metal "chills." The metal should be melted in plumbago crucibles and not heated beyond its molten point, 1215 degrees Fahrenheit. It also must be poured with care, owing to the absorption of occluded gases and air. Melting aluminum as suggested would involve a furnace capable of developing the proper heat and it is advisable to have the work done at a foundry having equipment for handling the metal. The work would be more satisfactory and less expensive than if it were performed at home.

Fitting Pistons to Cylinders.

(1436)—I have a two-cylinder, two-cycle motor and am overhauling it and replacing worn parts. I should like to make a new piston and would like to have your opinion as to how much clearance to allow between the piston and the walls of the cylinder. Also please inform me how strong a motor I would require for a three-ton truck? I want to buy an old automobile with the intention of rebuilding it.

JOSEPH FRANZ.

Brooklyn, N. Y., Nov. 28.

The usual clearance is about .001 inch, although there is a difference of opinion. Much depends upon the cooling efficiency, and as to whether the engine is air or water-cooled. Less than .001 inch has been used with success, but

Digitized by Google

more is common practise. Before fitting a new piston it would be advisable to examine the cylinder to ascertain whether or not it is true. If not it should be rebored as fitting a new piston to a cylinder worn out of true will not warrant the expense involved.

Relative to the proper size motor to employ with a three-ton truck there are a number of conditions to be considered. The list of the three-ton models shows that 40 and 45 horsepowers predominate, although this is not the average, being merely a hasty summary of vehicles listed last season. There are a number of machines equipped with motors rated at from 30 to 40, and it should be borne in mind that the ratings are those given by the manufacturer in the majority of cases, not the S. A. E.

The motor size may be determined from different working conditions, assuming any of the prospective load and tractive resistances as basic in the figuring. The motor should be small enough to render reliable service when the run of the empty vehicle covers good level roads and the desired speed is obtained with the highest ratio in the drive, whereby the engine itself remains within the prescribed economical limits of speed and throttle opening. On the other hand, the motor must be sufficiently strong to propel the loaded machine under average road conditions as expected in service and to maintain the speed found to be most advantageous.

Any increase above a certain limit of tractive resistance, due to changes in the load, the road, etc., will be taken care of by introducing a greater ratio in the drive, retaining the economical motor speed and torque. The greatest ratio ought to be sufficient to make the vehicle negotiate the worst kind of roads to be met in service upon grades at a given slow speed and with a considerable load.

To illustrate the suggested method of selecting the motor for a commercial car, an example is given of a machine of three tons carrying capacity and weighing empty three tons. The tractive resistance when this truck passes empty over a level asphalt road can be assumed at 20 pounds a ton of weight propelled or 60 pounds total. With the driving wheels 36 inches in diameter the combined driving torque is 60x18=1080 lb.-in. For a given type of vehicle the mechanical efficiency in the drive between the motor and the wheels is held to be about 65 per cent. The highest speed ratio in this drive would be found by comparing the desired vehicle speed at this moment with the motor revolutions a minute corresponding to the upper limit set by its fuel consumption requirements with the throttle partially closed.

When the runs are only occasional and for a short time, higher motor revolutions a minute may be selected, followed with increased or reduced ratio in the drive. The latter is held by some to be desirable in that it brings the gear ratio closer to the ratio used for average running conditions, thus reducing the number of gear changes required.

The determined developed torque capacity of the prospective motor should be checked as to the power and speed requirements for average service conditions comprising the most frequent runs with usual loads. When service conditions require great promptness, a more powerful motor may be utilized. As previously stated the nature of the hauls, road conditions, etc., are factors to be considered.

Relative to rebuilding an old automobile into a three-ton truck, it is a question as whether the time and expense involved would warrant the work. Many components would have to be altered and possibly the work would involve the making of special parts which would not only be expensive, but would cause delay in replacement in the event of accident. The writer is of the opinion that it would be far more economical to purchase a machine constructed especially for the work intended. It should also be borne in mind that efficiency and durability are important factors in motor transportation and that the value of a truck depends largely upon reliability in that it is a saver of time.

Wattage of Lamps.

(1464)—Will you kindly explain how to find the number of watts consumed in an electrical circuit, such as lamps? ELECTRIC.
Cleveland, O., Dec. 3.

To find the watts consumed in a given electrical circuit, such as a lamp, multiply the volts by the amperes.

That there is a plan under way to enact legislation that will result in the expenditure of a major portion of the state's highway appropriation for the special benefit of transient motorists travelling between New York and Boston, and deprive the small towns of the usual contributions for roads, is the opinion of some of the officials of small places throughout the state of Connecticut. Consequently the selectmen are organizing to protect their interests and to block legislation which may be considered detrimental to the rural sections.

AUTOMOBILE SCHOOL METHODS.

Students at Boston Y. M. C. A. Have Opportunity to Study Along Varied Lines.

The methods of teaching automobile courses vary greatly in different sections of the country. Perhaps no institution in the East has a better record for successful management than the Boston Y. M. C. A. Automobile School, which not only has the usual evening classes, but can boast of a large day class as well. An accompanying illustration shows 55 day students on a tour of inspection of the Packard service depot in that city.

Day Baker, New England Manager, General Vehicle Company.

Officials of the Packard company placed a truck at the disposal of the class and took particular pains to explain all the details of the big establishment, not forgetting the various systems and methods in use in each department. The students were very glad of the opportunity to gain first hand information concerning the practical workings of the service station, and the tour came as a fitting adjunct to a series of talks now being delivered by several Boston dealers.

Included in this list of talks was a recent illustrated lecture by Day Baker, New England manager of the General Vehicle Company, his subject being "Electric Wagons and Trucks and Their Relation to the Gasoline Driven Vehicle." Mr. Baker did not confine himself to the products of his company, but gave a general discussion of the whole industry. Several factory representatives also have been heard by the students.

Party of Students at Boston Y. M. C. A. Automobile School, Inspecting Packard Service Station in Packard Truck.

NOTHING TO DO BUT DRIVE.

General Manager of American Motors Company Thus Characterizes Product of His Concern.

General Manager V. A. Longaker of the American Motors Company, Indianapolis, Ind., maker of American cars, is enthusiastic over the new line the company has placed on the market. "The new American product is a combination de luxe of everything that is safest and best in motor car construction," he says. "Add to the world-famous underslung construction the closed bodies, rivalling in excellence of appointment, convenience and luxury the finest palace cars and the 'Traveller' and 'Tourist' limousines are among the best appointed cars on the market. The powerful electrical equipment is the best the market affords; the motor is started and the lights controlled from the driver's seat. There is absolutely nothing to do but drive."

In the future, motor cars will be used exclusively by the North Dakota Better Farming Association to carry education in modern farming methods direct to the farmer on his land. An exhaustive test extending over two years has been completed by Secretary Thomas Cooper, who announces the adoption of the motor car by the association. As a result the field men, stationed in 20 counties of the state and covering their entire territory once a week, will be provided with automobiles and will use them in carrying to the farmers latest discoveries in agricultural progress.

Entered as second class matter, April 16th, 1906, at the Postoffice at Pawtucket, R. I., under the Act of Congress of March 3rd, 1879.

EVOLUTION OF THE INDUSTRY.

Twenty years ago inventors were generally believed to be wasting their time experimenting with the gasoline horseless carriage. It was conceded by some that electric and steam wagons might have a future, but that the internal combustion engine was to become a dominating factor in the world's industrial history was by no means to be considered seriously. Here and there were found occasional individuals and societies who were willing to offer large prizes for the development of practical machines, but so late as 1898 the esteemed Scientific American voiced the sentiment of many when it deplored such expenditure.

According to the statistics compiled by the United States government and based upon the census of 1909-10, one cent of every $1 in American capital is invested in the manufacture of automobiles today. The number of wage earners in the industry is proportionately greater than in any other field of activity, and the wage standard figures out much higher than in any other industry. There is plenty of food for thought here for the political economist who has been wont to decry the lack of economical productiveness in the manufacture of the automobile.

THE INTERNATIONAL SHOW.

That the recent British show in Olympia, London, England, was worthy of the designation international, is borne out by the fact that more than 51 per cent. of the cars on display were produced by other countries than those comprising Great Britain. The exact representation from each country follows: England, 71; France, 59; German, 16; Italy, 13; America, 12; Belgium, 10; Scotland, three; Switzerland, two; Austria, two, and Holland, one. Yet it seems to be true that American influence dominated the entire exhibition.

The Autocar, which seems to possess the foreign idea that it is the critic's business to criticise, finds little in the show with which it may take issue. After commenting upon the fact that the display was international, such as is held in no other city in the world, it scores the exhibitors who failed to present chassis without body equipment, and demands that the Society of Motor Manufacturers & Traders adopt a rigid rule under which each maker who has a certain size of stand shall be compelled to show at least one chassis.

UPSETTING TRAFFIC REGULATIONS.

With three members dissenting the Massachusetts supreme court has handed down a decision which completely upsets the traffic regulations now in force in a large number of cities and towns in that commonwealth. The question hinges upon the interpretation of a law passed in 1820, which four members of the court hold applies to street cars, while the three minority members, including the chief justice, feel certain the legislature of that year could not have intended to include electric cars, or even horse cars.

Under the terms of this ancient law vehicles are compelled to pass other vehicles from the rear on the left, and the majority of the court holds that this means the passing vehicle must drive to the left of the middle of the travelled way. Of course, where street car tracks are laid

Digitized by Google

at the extreme edge of the highway there is no possible manner in which the law can be obeyed, and the court takes judicial knowledge of this fact. The sole point at issue is as to whether or not automobiles, for instance, must cross the road in the face of opposing traffic in order to pass an electric street car on the left. The traffic regulations state explicitly that this must not be done. The law of 1820 says it shall, according to the supreme court, which includes in its decision a suggestion that the remedy lies with the legislature.

The need for satisfactory traffic regulations, in order that slower moving vehicles shall be unable to delay the progress of the more modern means of transportation, is felt keenly by motor truck men, as well as the occupants of so-called pleasure automobiles. The proposed amendment prepared by the Automobile Legal Association, which exempts street cars from the provisions of the law of the road, appears to be a practical solution of the difficulty. It hardly seems necessary to suggest that if the laws of 100 years ago cannot be made to apply to present day needs, they should be repealed forthwith. The decision of the supreme court adds new dangers instead of eliminating them.

THE ROAD TAX PROBLEM.

There appears to be increasing evidence that the general public and the press of the country have come to appreciate that automobile registration fees are primarily a road tax. Motorists are compelled to face this problem as often as the various state legislators assemble. Several legislatures will have before them this year propositions to increase the present fees, and each will be accompanied by the argument that the cars are instrumental in causing added expenditure for highway construction and maintenance.

The trouble with reciprocity in New Jersey always has been identified with this view of the matter. The admission by the state road commissioner that possibly horse drawn vehicles cause some of the damage is a distinct surprise. Now comes Minnesota with a discovery that while all vehicles contribute to the wear and tear of the roads, all vehicles do not contribute alike in this respect. Perhaps the whole subject is summed up best in a recent editorial appearing in the Christian Science Monitor of Boston, as follows:

> The highways have resolved themselves into a problem in taxation, and nearly every municipality, county and state and province is trying to solve it for itself. Everybody is by this time familiar with the automobile tax. Everybody is familiar with the wheel tax. The road tax is as old as the ancients. The trouble with all of them is that they are inadequate and inequitable. There are too many different kinds of taxes and too many methods of imposing them. What is needed is one simple yet comprehensive highway taxing system that will be uniform throughout the greater part of the North American continent.

BASING FEES ON TONNAGE.

Although there has been general complaint concerning the common practise of utilizing the horsepower rating in arranging the fees for motor trucks, the city council in Los Angeles, Cal., appears to be the first legislative body to recognize the merit of the tonnage plan. If it be granted that the license fee is to operate in the nature of a road tax, it follows that the vehicle that is most heavily loaded will do the most damage to the roads, other things being equal.

Wheel taxes have long been graded according to the number of horses hauling the loaded vehicle. If the amount of horsepower were in any way analogous to the number of horses utilized, there might be some reason for its use, but inasmuch as it is well known that one truck of a given capacity is fitted with a motor capable of developing much greater horsepower than another of the same rated capacity, the situation cannot be analogous.

RESPONSIBILITY OF THE DRIVER.

The authorities in Berlin, Germany, recently passed an ordinance forbidding anyone to smoke while at the steering wheel of a motor vehicle. The explanation is that smoking diverts the mind somewhat from complete attention to the act of steering.

This legislation will appeal to American motorists as rather more stringent than is necessary. There is little doubt that when compared with the horse the automobile has absolutely no sense of self-preservation, and the responsibility placed upon the man at the wheel of a motor car is great. The other users of the highway have rights which must be respected, but Americans believe it is possible to smoke and think at the same time.

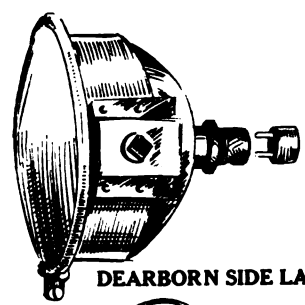
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS

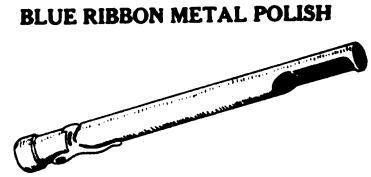


Dearborn Electric Sidelights are produced by the Dearborn Hardware & Lamp Manufacturing Company, 2911 Carroll avenue, Chicago, and it is claimed these lights will withstand hard service and provide good illumination. They are constructed of one-piece heavy brass and the side brackets are securely riveted. The interior is heavily silver plated and highly polished, and a focussing device of solid brass, operated from the outside, is a feature of the design. It is fitted with an Ediswan socket, also a complete connector made of genuine hard rubber. The lamps are six-inch and are moderately priced.

—— ★ ——

The Catelain Hose Clamp is produced by the Power Sales Manufacturing Company, 122 South Michigan avenue, Chicago, and is so constructed that it will fit different sized hose from .75 to four inches outside diameters. It is also claimed that it will retain equally well oblong shaped pieces. It comprises a brass band, .75-inch wide, which encircles the hose and is drawn tight with a screw and brass thumb nut.

—— ★ ——



Blue Ribbon Cream Metal Polish is manufactured by the International Metal Polish Company, Quill street and Belt R. R., Indianapolis, Ind., and among the qualities of it is that it does not require any shaking, the ingredients being carefully blended and in the form of an emulsion. The liquid is greaseless and being free from any sediment does not collect in crevices no matter how liberally applied. It will remove quickily and easily all tarnish from metal, is especially adapted for inside metal trimmings and will not soil fabric. It is put up in five and 10-gallon cans for garage and service stations, and in smaller containers for the owner. The company also manufactures the Blue Ribbon greaseless cream, an automobile and furniture body gloss and polish. By its use the lustre and gloss of the paint are restored and in addition to leaving a highly polished surface, it does not attract the dust. It is likewise adaptable for cleaning, preserving and brightening leather trimmings.

DEARBORN SIDE LAMP

BLUE RIBBON METAL POLISH

MATCHLESS LIGHTER

CATELAIN HOSE CLAMP

DETROIT FORE DOOR

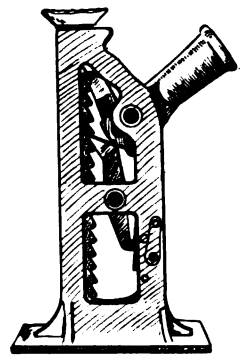
—— ★ ——

The Matchless Pocket Lighter, marketed by the Schiller Manufacturing Company, Chicago, is a compact, seamless tube, nickel plated and containing gasoline or alcohol, which saturates a wire mounted fireproof wick. The fuel is ignited by a plunger carrying a piece of "Pyrofor," capable of 5000 ignitions. It is used in a manner similar to striking a match and the shower of resulting sparks ignites the wick member. When the plunger is in service a spring with a cap and sponge is compressed, forcing the fluid above the sponge and keeping the wick saturated. The shoulder is tapered, hermetically sealing the receptacle tube, but the knurl makes it possible to remove it evenly and quickly. The lighter is four inches long and weighs but an ounce.

—— ★ ——

Detroit Fore Doors, manufactured by the Detroit Fore Door Company, Detroit, are designed for attachment to motor cars not provided with these members, and a quality of the construction is that they may be fitted easily by any-

Digitized by Google

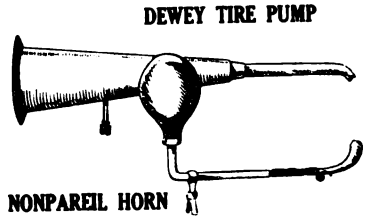


one having a knowledge of the use of a screw driver, bit and brace, and a monkey wrench. The doors are of the detachable type and being built of a one-piece aluminum, cannot warp or get out of shape. Each set of doors is upholstered and finished in the standard colors of the car for which it is made and has five coats of paint and two of varnish. The doors are particularly designed for 1911 models of Ford, E-M-F and Hudson machines and are finished in colors to match. In addition to keeping out the cold winds, they add to the appearance of the car, bringing it up to lines of the most modern construction.

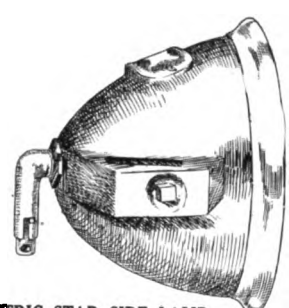
★

The Pratt Auto Jack is the product of the William E. Pratt Manufacturing Company, 91 Lake street, Chicago, and qualities emphasized are light weight, compactness and ease of operation. They are constructed of galvanized malleable iron and the five parts are secured by two bolts. They may be raised or lowered one notch at the time, on the downward stroke, a small trigger device being moved to bring about the desired movement. J. J. Kelleher, 612 Columbus avenue, Boston, is distributor.

★



The Dewey Power Tire Pump, manufactured by the Dewey Anderson Company, Toledo, O., is actuated by the energy of the motor and is inserted in the spark plug opening. The pump proper is constructed of brass and is so designed that pure, fresh air is taken from the outside into a special chamber, thence forced to the tire through 12 feet of hose. The latter has self-opening connections and is equipped with adapters for any car. A pressure gauge is also supplied for determining the desired number of pounds.



PRATT AUTO JACK

DEWEY TIRE PUMP

NONPAREIL HORN

ELECTRIC STAR SIDE LAMP

LUBRO ANTI-FREEZE FLUID

★

The Nonpareil Auto Horn, marketed by the Nonpareil Horn Manufacturing Company, 73 Wooster street, New York City, is of the concealed type in that it is designed to be located under the hood. It is very compact and is said to produce a considerable volume of deep, penetrating sound. It is operated by air, the bulb being located under the steering wheel.

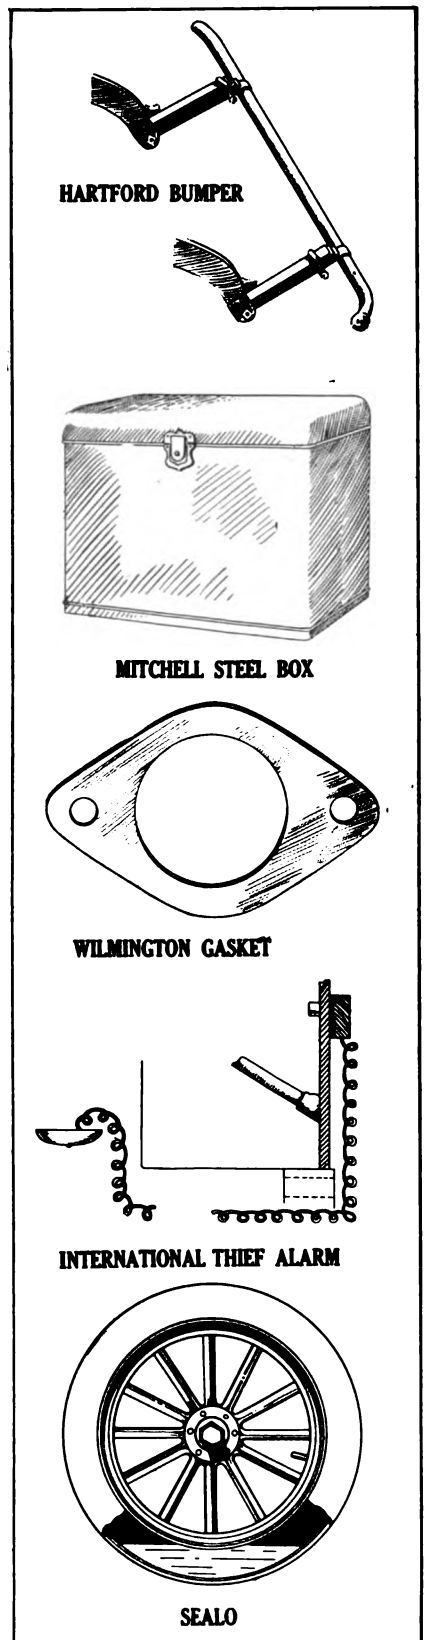
★

Electric Star, style D side lamps are manufactured by the Milwaukee Bronze Casting Company, 119 Clinton street, Milwaukee, Wis., and a quality is that they are made to fit any type of lamp bracket. They are six inches in diameter, are free from rivets and solder and have but one essential screw. The lamps are cast of thick, non-corrosive silvered aluminum which takes a very high polish and which maintains its lustre. The metal has a slight bluish tint, which is held to increase the efficiency. Each lamp is equipped with an Ediswan bayonet catch base. The lenses are constructed of plate glass laid in rubber, and the lamps are water, air and dust proof.

★

Lubro Anti-Freeze Fluid is manufactured by the Lubro Oil Company, 116 Prospect avenue, N. W., Cleveland, O. It differs from the usual anti-freezing solutions in that it does not require testing from time to time with an instrument to ascertain the freezing temperature. The fluid is red and its strength may be determined by the color which fades as it weakens. Being a bright color it is a simple matter to locate leaks in a radiator, and

Digitized by Google



the garage man is prevented from drawing off the fluid by mistake. The maker also emphasizes the fact that Lubro does not boil or evaporate as easily as water and that it keeps the cooling system free from rust and corrosion. Another quality is that it is of a lubricating nature. One gallon added to 3.5 gallons of water provides sufficient fluid for the ordinary radiator. Lubro comes in gallon cans and is moderately priced.

—— ★ ——

The Hartford Bumper is the latest product of the Hartford Suspension Company, Jersey City, N. J., and one of its qualities is its simplicity, both in construction and attachment. It is of the friction spring design and comprises in addition to the conventional bumper bar, two friction spring arms, two spring mounting saddle sockets, two clips or U bolts, two clip yokes and four clip nuts. Each spring arm has four leaves, which distribute the shock of collision, and not only prevent the colliding object from coming in contact with the car, but absorb the greater part of the impact, thereby saving the machine from undesirable stresses. One of the qualities of the Hartford device is that it may be attached easily by anyone, being clamped to the top of the side members of the frame, requiring but a monkey wrench to fit. It is made in four models, large, medium, small and special. The last named is designed for model T Ford cars. The maker lays great emphasis upon the fact that the construction is such that it cannot rattle.

—— ★ ——

Mitchell Boxes, manufactured by G. F. Mitchell & Son, Cleveland, O., are made in several different styles and dimensions to meet individual requirements. They are constructed of steel and a quality claimed is neatness of design and fit of covers. Each box is equipped with a Yale lock, the maker holding that it is the best obtainable and that it eliminates duplication of keys. The boxes are neatly finished. Tank members also are supplied.

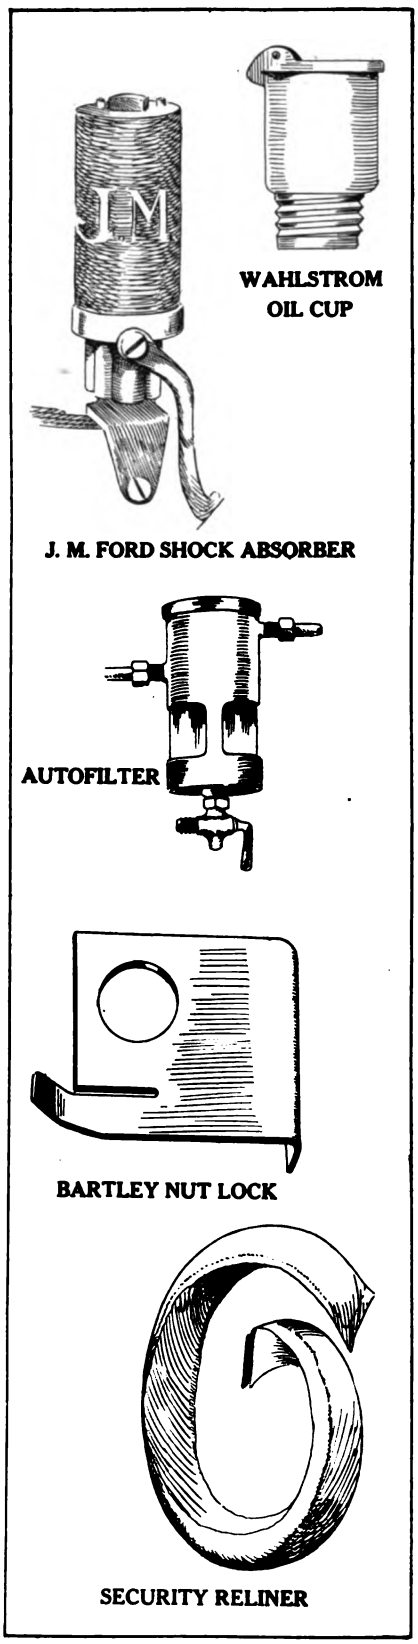
—— ★ ——

The Wilmington Gasket is the product of the Wilmington Fibre Specialty Company, Wilmington, Del., which concern specializes in hard vulcanized fibre in different forms. Although the gaskets are constructed of fibre, the material is flexible, making it an easy matter to utilize them on poor fitting joints. They are designed especially for parts subject to considerable heat and are made to meet individual requirements.

—— ★ ——

The International Thief Alarm is being marketed by the International Automobile Thief Alarm Manufacturing Company, 151 West Sixth street, St. Paul, Minn., and presents interesting features in that a concealed gong of liberal size is sounded by electricity if the car is started. The device comprises in addition to the alarm, a Yale lock and a switch, the former being actuated by a key. On leaving the car the switch is locked, cutting out the current from either the magneto or battery. If an attempt is made to start the motor with the switch locked the current is diverted to the gong, which continues to ring until the switch is unlocked with the key. The working parts being concealed, there is nothing to indicate that the machine has an alarm.

Digitized by Google



Sealo, manufactured by the Sealo Tire Company, 1409 Michigan avenue, Chicago, is a fluid which is injected into the inner tube through the valve stem and the maker claims that it will instantly and automatically seal punctures without loss of normal pressure. It is stated that the fluid preserves the rubber, does not cause sticking of the inner tube to the shoe, will not freeze or evaporate, and is not injurious to the paint or varnish. It is introduced by a special injection gun which is loaned by the maker.

—— ★ ——

The Wahlstrom Oil Cup, manufactured by the Wahlstrom Tool Company, 346 Carroll street, Brooklyn, N. Y., is a dust proof oiling device which is fitted by means of a screw driver, the cup having a slot for this purpose. The cover is retained by a spring which may be lifted by the spout of the oil can when lubricant is being inserted. The oil aperture is straight, permitting of cleaning with a wire. The cup comes in sizes from .25-inch, 32 threads, to .5 inch, 24 threads.

—— ★ ——

The Ford J. M. Shock Absorbers are manufactured by the J. M. Shock Absorber Company, 2 10 South 17th street, Philadelphia, and are designed expressly for model T Ford automobiles. They comprise the same features of construction and material as the larger sizes. They are attached easily to the rear spring and the work does not require any change or the use of special tools. They not only serve as an auxiliary spring, making for easy riding qualities, but hold the rear wheels to the ground, insuring continuous traction. The absorbers

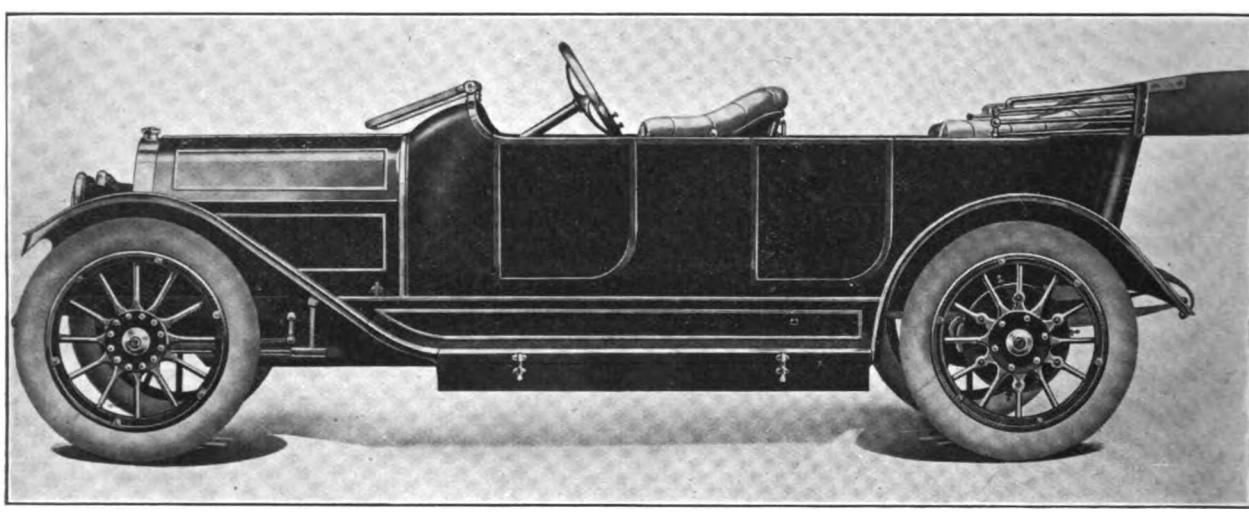
are moderately priced and the company issues an interesting booklet which will be sent free.

—— ★ ——

The Autofilter, marketed by the Bousman Manufacturing Company, 18 Plainfield avenue, Grand Rapids, Mich., is as the name implies, designed to separate water and foreign elements from the fuel and is incorporated between the supply tank and the carburetor. It presents interesting features in that the lower part of the device is provided with glass windows, making it a simple matter for the operator to note if the filter needs draining of sediment, etc. It is constructed of brass and the sight members are so secured that they are leak proof and protected from injury.

—— ★ ——

The Bartley Nut Lock and bolt fastener is the product of the Bartley Nut & Bolt Fastener Company, Pittsburg, Penn., and the maker holds that the device eliminates the use of double nuts, keys, cotter pins or other means for preventing the loosening and loss of nuts. The fasteners are constructed of mild open hearth steel. The device is placed between the nut and part, and after the former has been tightened the locking arm is bent easily into position.



—— ★ ——

Security Reliners are manufactured by the Security Reliner Company, Inc., Montgomery, N. Y., and as the name implies are designed for insertion in the shoe to strengthen tires which have become worn and are subject to a blow-out. The reliners are constructed of high grade material and of such thickness that ordinary punctures are prevented. They come neatly rolled and are easily fitted in place.

MICHIGAN LINE FEATURES NEW CHASSIS.

HEADED by a new 40 horsepower chassis which is designated as the "Mighty" Michigan 40, the line presented by the Michigan Motor Car Company, Kalamazoo, Mich., for the coming season includes constructional features and conveniences incorporated in high priced machines and at a popular cost. Among the many refinements noticeable of the new model, which is distinctive in design, are: Electric lights, motor starter, a four-speed transmission, long wheelbase, adjustable steering column and operating pedals, left hand drive and centre control, large tires, deep, luxurious upholstery and a very complete equipment. Two bodies are fitted to the new chassis, a touring and a roadster, these being known as models R and S, respectively. Other members of the Michigan line include models L and O, a five-passenger touring and a roadster, fitted to a 33 horsepower chassis.

The Model R "Mighty" Michigan, a Five-Passenger Touring Car with Extra Large Tires, Four-Speed Transmission and Full Equipment.

The new chassis is the creation of W. H. Cameron, who was formerly identified with the Willys-Overland Company as chief engineer and with other prominent companies, including the makers of the Packard, Oldsmobile and Marmon cars. He ranks as one of the foremost automobile engineers in this country and has had considerable experience abroad. In the new Michigan he has incorporated principles well established and indorsed by sound engineering practise. The policy of the company to employ high grade material and workmanship has been continued and a noteworthy feature of the design is that its construction is in every way substantial. All wearing parts are of unusually large proportions, making for durability and minimum cost of maintenance.

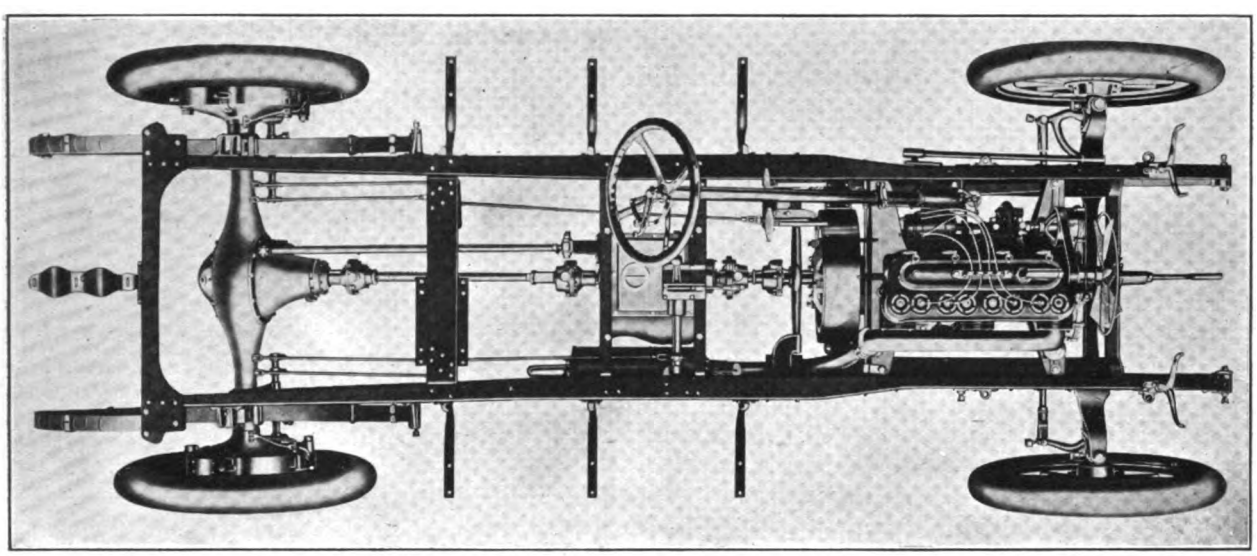
Four Forward Speeds.

Although the horsepower production is rated at 40, ample for all requirements, Designer Cameron lays great emphasis upon the Michigan four-speed transmission with direct drive on the fourth, stating that it adds much to the ease and pleasure of riding and provides an efficient and logical control of the car at a minimum expense of fuel. Greater flexibility is assured in practical service, especially when negotiating grades too steep for the direct drive. On such the operator can drop back into the third without unnecessarily racing the motor, obtaining a gear ratio approximately 4.5 to one, which with the ample reserve power of the motor permits of climbing the hill at a good rate of speed and without taxing the engine. It is also pointed out that the addition of the extra speed eliminates the usual gap between second and high, and that the four-speed transmission is indorsed in high priced foreign cars.

Motor Cast En Bloc.

The motor is a four-cycle, four-cylinder unit with the cylinders cast en bloc, having a bore of 4.25 inches and stroke of 5.25. It is rated at 40 horsepower, although it is stated that it has developed considerable in excess of this energy in tests. The piston displacement is 297.8 cubic inches. The material employed is a special gray iron and the cylinders are accurately bored and

Digitized by Google



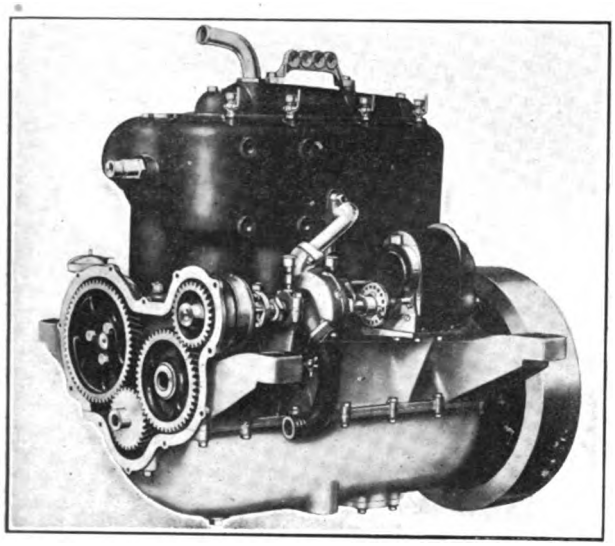
ground, as are the pistons and rings. The cylinders are of the L head type with the interchangeable mechanical valves located on the right. The valve construction embodies 3.5 per cent. nickel steel heads electrically welded to carbon steel stems, and operation is by mushroom lifters. They are liberal in size, adjustable and noiseless in operation. This is due to the design of the cams, small clearance between the push-rods and valve stems, and to the enclosing of the mechanism by a spring cover plate, easily detached and replaced. Noteworthy features of the cover are its compactness and its locking mechanism.

The design of the piston is held to eliminate superfluous oiling, thereby preventing smoking of the motor. The lower groove of each piston is bevelled and drilled, so that all excess oil on the cylinder walls is collected and led through these apertures. The surplus lubricant is drained through the holes directly into pockets cast on the sides of the wristpin bosses, thence into the wristpin bearings, which are thus constantly oiled. The hollow wristpins are liberal in diameter, being 1.1875 inches, and have .1875-inch walls. They are hardened and ground to exact size and have bearings in the piston bosses.

Long connecting rods are employed, being 11.875 inches by .8125 inch, and although of light weight, strength has not been sacrificed. They are formed in deep I beam section, drop forged and heat treated. Four chrome vanadium bolts locked by castellated nuts secure the bearing cap to the connecting rod and the bearings are liberal in size, 2.375 by 1.875 inches. Provision is made for compensating for wear, the adjustments being made by the removal of a thin shim, a number of which are fitted. The upper end of the connecting rod is split and is clamped to the wristpin.

Liberal Sized Crankshaft.

The crankshaft is liberal in size and is of 45 point carbon steel, heat treated and ground carefully to size. It has a tensile strength of 90,000 pounds and rotates in three large bearings of special nickel babbitt. The front bearing is .75 inch in diameter and 3.125 inches long, while the centre bearing is two by 2.5 inches. The rear bearing is of extra large size, being 2.125 by four inches. All are die cast. The camshaft is constructed of high grade material and is provided with a thrust bearing, eliminating the possibility of end play, as well as noisy operation.



Plan View of New Michigan Chassis, Illustrating Simplicity of Design and Accessibility of Components.

Special attention has been paid to the material and construction of the timing gears, which are wide faced and of the helical type. The crankshaft and magneto gears are of a high grade steel, while idler and camshaft gears are of cast iron, making for durability and quiet operation. Instead of being packed with grease the timing gears are flooded with oil from the circulating pump in the oil base. This is held to eliminate possibility of smoking due to the grease working back into the oil base and not only prevents carbonization, but makes for quiet operation, durability and accurate timing.

The crankcase is of a high grade aluminum, is divided, and the upper section has four substantial arms cast integral, these extending to brackets on the main frame, eliminating the use

Digitized by Google

Indicating the Compactness of Michigan Power Plant and Accessibility of Water Pump and Magneto.

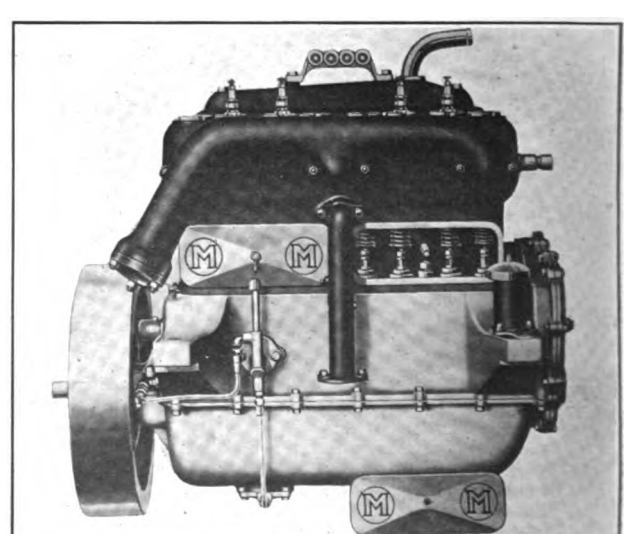
of a sub-frame. The compactness of the power plant and method of suspension makes for a low centre of gravity as well as accessibility.

Lubrication.

The lubrication system has been carefully worked out with a view to proper and efficient lubrication, and is of the constant level splash type. The lower part of the crankcase serves as the oil reservoir and the oil is forced to the working parts by a plunger pump driven off a special cam on the camshaft. The lubricant is strained in the base.

Carburetion is by a model L Schebler carburetor located on the right side of the motor and the intake pipe is unusually straight and free from bends, thereby preventing the condensation of the mixture and making for easy starting in cold weather. The carburetor is equipped with an adjustable device for regulating the auxiliary air, the control member being located on the dash and convenient to the operator. The gasoline tank is on the front seat, is of ample capacity and feed is by gravity. Provision is made for draining the container when desired, a petcock being fitted for this purpose. A shut-off valve is also incorporated in the main line just above the running board on the right hand side of the car.

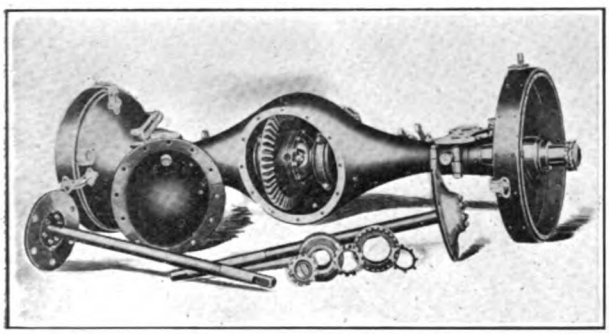
Dual Ignition.



A dual system of ignition is provided, a high-tension Briggs magneto and batteries and coil. The coil is located inside the hood and a key lock switch is mounted on the dash. The company calls particular attention to the life guarantee of the magneto, the maker paying transportation charges both ways when repair or overhaul becomes necessary.

Cooling is by a centrifugal pump of special design mounted on the left side of the motor and shaft driven. Features of the construction are the use of accessible packing boxes and the ease with which it may be dismounted without disturbing other units. The cooled fluid is taken from an improved cellular type of radiator and enters the lower centre portion of the water jackets, flows around the valves, thence out through a liberal sized outlet pipe to the cooler. The water manifold is of liberal size, permitting of cleaning the jackets, and is retained by four bolts, two of which serve to secure the bridge member supporting the high-tension leads from the magneto. Cooling is further aided by a ball bearing, adjustable fan.

Aluminum Cone Clutch.



A leather faced aluminum cone clutch is employed, 15.5 inches in diameter and having a face of 2.5 inches. Six plungers, operated by helical springs, provide for uniform engagement and the maker states that the action is remarkably easy, permitting of starting on the high gear without slipping. The clutch is easily accessible and readily removed and adjustment is by three external springs. It is actuated by pedal at the left of the driver.

A double universal joint is interposed between the clutch and the transmission which is unusually compact in design and is supported by two substantial cross members of the frame. It may be removed easily without displacing the body or other components. All gears are of five pitch, .875-inch face and of exceptionally large

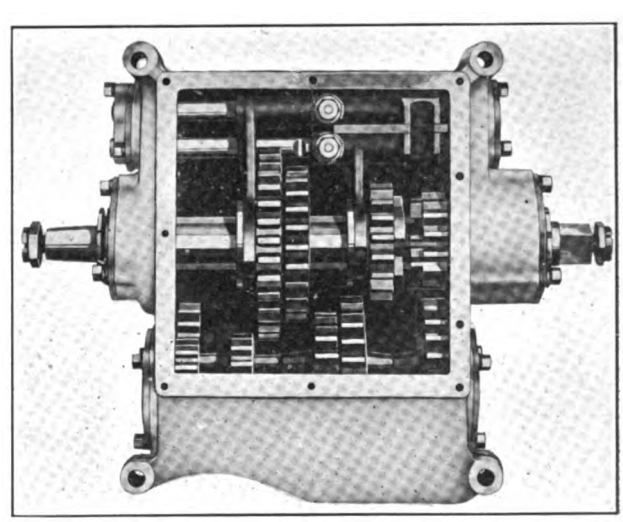
The Valves of the Michigan Motor Are Enclosed by Well Designed Plates—Note the Accessibility of the Oil Pump.

Digitized by Google

Showing the Sturdy Construction of the Full Floating Type of Rear Axle, a Feature of Which Is the Provision Made for Easy Adjustment of Components.

diameter, the centre distances between the shafts being five inches. The gears are heat treated, ground in the bore and bear upon a heat treated and ground shaft having four integral keys milled from a solid bar. Imported annular ball bearings are utilized throughout and the housing is a high grade aluminum alloy, while the gear shift levers are drop forged steel.

The shifting yokes are equipped with adjustable lock plungers which locate their position at each gear change. The transmission is also provided with an interlocking device which positively prevents the movement of one yoke when another is in motion. All shafts are fitted with stuffing boxes and joints with gaskets, preventing the leakage of lubricant. Access to the gears for inspection or for lubrication is by means of a liberal sized inspection cover.



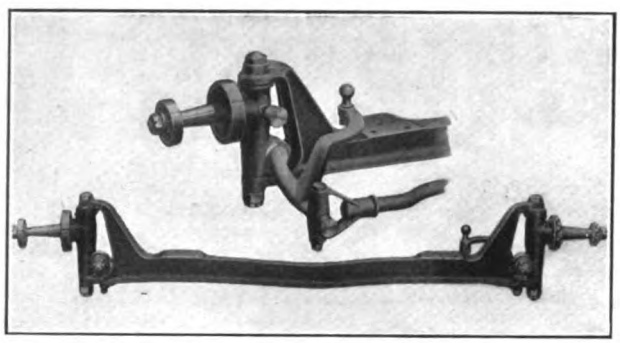
Final drive is by a shaft of heat treated chrome nickel steel of liberal size and having a tensile strength of 130,000 pounds to the square inch. The torque rod is of ample dimensions, its rear end being mounted on the rear axle and the forward supported by a double-spring buffer secured to the cross frame member.

Substantial Rear Construction.

The rear axle of the Michigan is unusually substantial and is of the full floating type. The housing is constructed of two stampings of .1875-inch hot rolled sheet steel, welded by the autogenous process. It is reinforced internally by the tubes which carry the wheel bearing, being extended clear through the main housing and as close to the differential as is practicable, and supported by elliptical plates embracing the wheel bearing tube and extending to the main housing walls to which they are welded. The tubes and plates are placed in the housing before welding, making for a unit construction.

The housing containing the differential, driving gears and bearings, is an iron casting, and these may be removed easily as a unit for inspection or repair. Adjustment of the lateral location of the differential and driving gear is obtained by two slotted nuts threaded on the differential cases and locked by claw dogs engaging the slots in the periphery of the nuts, and by cotter pins. The longitudinal location of the driving pinion is secured by rotating the case in which the entire pinion shaft and bearings are assembled. This case is threaded into the carrier and retained by a latch locking into a slotted rim of the pinion case, the latch being retained in the carrier by a bolt which must be removed before the latch can be raised. It is pointed out by the maker that the construction permits of disassembling by the inexperienced without disturbing bearing adjustments or changing the mesh of the gears.

The driving shafts are 1.375 inches in diameter, made from 3.5-inch hot rolled nickel steel, heat treated, and each shaft is a solid piece upset at the outer end to a sufficient size to allow the flange to be riveted on. The main driving gear is a 20 point carbon open hearth steel forging, case hardened and ground. The driving pinion is of 3.5-inch nickel steel, case hardened and heat treated, and the taper hole is ground where fitted to the pinion shaft. These gears are 1.3125-inch face and four diametral pitch. The differential gears are of the bevel pinion type. These gears and their bearings are lubricated by means of grease and oil contained in the main housing, which also supplies lubricant to the pinion and pinion shaft bearing. The lubricant is prevented from working out to the brakes by well designed gland nuts



The Cameron Four-Speed Transmission Is Very Compact—Direct Drive Is on the Fourth Speed.

Digitized by Google

fitted on the outer end of the shaft tubes.

All bearings are New Departure double row ball with bronze ball separator. The differential

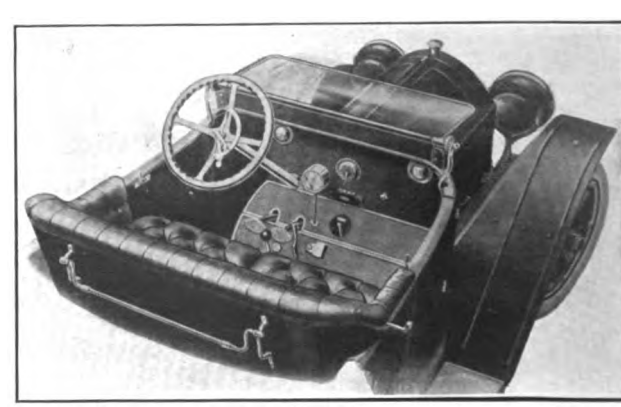
Front Axle Detail, Showing Cameron's Method of Tapping Grease Cups into Sides of Spindles and Tierod Bolts.

bearings are equipped with .5-inch balls and the hub with .625-inch. The wheel bearings are lubricated by means of push open oilers located in the driving shaft flange, which introduces the oil directly to the bearings. Brake shafts and spring seats are provided with suitable ratchet grease cups.

Sturdy Front Axle.

The front axle is a special design by Cameron and a noticeable quality is the sturdiness of construction. The axle bed is a 2.75-inch I beam section, 1.75 inches wide, and having a .25-inch web. The spring seats are forged integral with long tapering flanges on either side, providing lateral strength. The material employed is 40 point carbon open hearth steel, heat treated.

The spindles are of unusual size, a commendable design. They are 1.5625 inches in diameter and the bolts are one inch in diameter, case hardened and ground to exact size. They are threaded into the lower head of the axle yoke and locked with castellated nuts, preventing rotation of the bolt in the axle and bringing all bearing stresses upon the bronze bushing.



The bearings for the spindle bolt are two phosphor bronze bushings, these being reamed after being pressed into place. Between the upper end of the spindle and axle yoke is a high carbon steel washer, which cares for the end load. A steel washer with a felt on the inside is placed on the spindle to prevent grease from working out of the hub, and also to exclude dirt from the bearings. The bearings may be lubricated without removing the hub cap, a plug member being fitted for this purpose.

The steering arms are constructed from 40 point carbon steel, heat treated, and forged with the bends, eliminating reheating to form. The arms are a taper fit in the knuckles and are drawn into place with case hardened castellated nuts which are pinned. The tierod is constructed from one-inch, 10-gauge seamless drawn steel tubing with drop forged yokes. The tierod bolts are case hardened and ground, threaded into the lower head of the yoke and locked with a castellated nut. The hub bearings are of the New Departure Radax type, sizes No. 0408 and No. 0405, which are held to be sufficient to carry any load. They are mounted so as to be adjustable.

Novel Lubrication.

A new method of lubricating the spindle bolts and cross rod bolts is noticeable, and one that eliminates drilling the bolts the entire length. The Cameron practise is to tap the side of the spindle and tierod boss, thereby forcing the grease upward and downward in the bearing. This also tends to force out any dirt that may accumulate.

The brakes are of the internal and external type, 16 inches in diameter, 2.25-inch face and are lined with a solid web of asbestos material. The latter is impregnated with a special compound, held to be impervious to oil, water or dirt, and both brakes are of the full floating type, toggle operated and very powerful. The service member is actuated by a pedal at the right of the driver and the emergency by lever. The brakes are normally held from contact with the drums by a number of springs and stops of proper size, so located that rattling is prevented. The clevis pins are of large size, and generous length of bearings in yokes and rods eliminate wear of small parts and noise. Means for easy adjustment are provided. Both sets are equalized.

The Steering Column and Operating Pedals Are Adjustable—Left Hand Drive and Centre Control with Seat Accessible at Either Side Are Among the Refinements.

The frame is of cold rolled steel, .3125 inch thick, and the dimensions denote strength. It is drawn in at the forward end, providing for great-

Digitized by Google

er angularity of the front wheels for turns, and a low centre of gravity is secured through a drop of 3.5 inches at the rear, this providing ample clearance for the rear axle. Pressed steel is utilized for the cross members, which are hot riveted.

Improvement is noticeable in the springs, which have been increased in width. The front members are semi-elliptic, 36 by 2.5 inches, while the rear are three-quarter elliptic, 50 by 2.25 inches. The springs are constructed of a special steel, ground and polished, making for easy riding qualities. The bolts are liberal in size, .625 inch, and all parts subject to friction are lubricated by grease cups. One of the qualities of the construction is that the springs are well clipped. Each member is fitted with a large rubber bumper.

Adjustable Steering Column.

One of the features of the steering mechanism, and one that will appeal to the discriminating motorist, is the means provided for adjusting the steering column. This may be raised or lowered to suit the convenience of the operator, a construction making for comfort as well as for perfect control. The steering wheel is located at the left, is of the worm and worm wheel type and is adjustable for wear. The gear forms one piece with the shaft, is of the full gear type, and when wear leaves one portion loose, another quadrant of the gear may be brought into contact with the worm. Ample provision is made for lubrication, numerous grease cups being fitted.

The steering wheel is 18 inches, corrugated, and the spark and gas control levers are of the friction snubbing type, making their operation a simple matter, as well as silent. The centre control is mounted upon the transmission cover member and the levers move in a compact housing. The gear shifting lever is provided with a hard rubber ball, fitting the hand. The comfort of the driver has been further considered by providing means for adjusting the brake and clutch pedals. The accelerator is of Michigan design, of the plunger type, and a side rest is provided. It is operated by a slight side rocking movement of the foot with the latter at rest. A muffler cut-out is actuated by pedal.

Wheels and Tires.

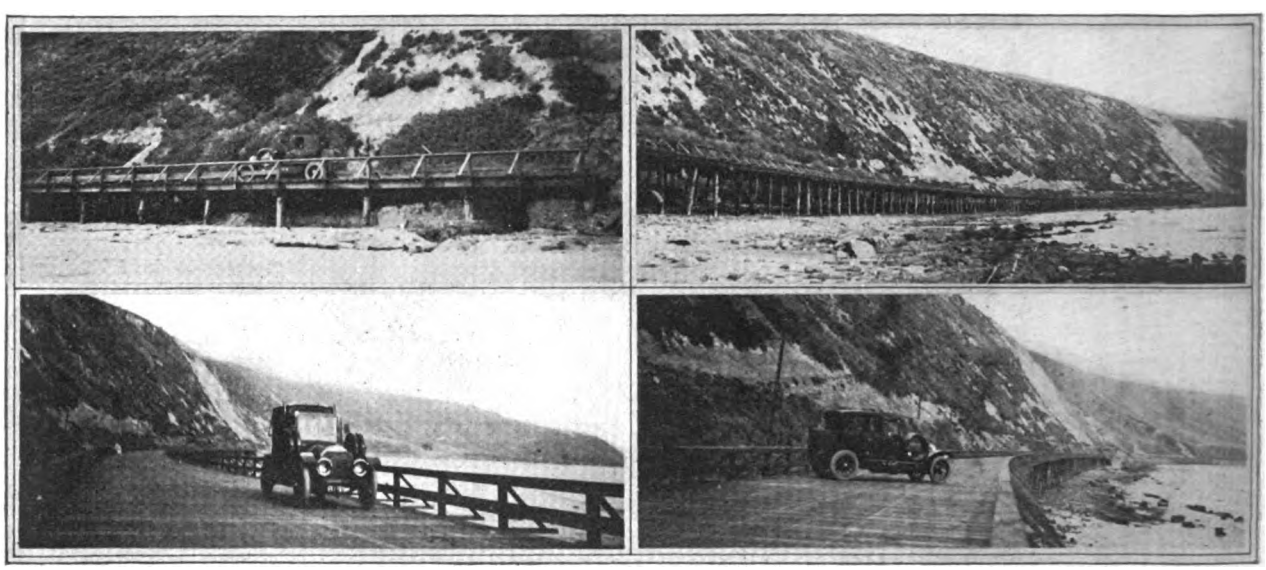
The wheels are of the Shortville artillery type, with oval spokes, 1.75 inches thick. There are 12 spokes to each wheel and 12 bolts are utilized in the front and rear. In the rear wheel six are employed in the hub and the balance through the brake drums and spokes.

The Michigan Motor Car Company lays great stress upon its tire equipment in that the car is overtired, being equipped with 35 by 4.5-inch shoes both front and rear. It is held that the Michigan is 21.5 per cent. over capacity, according to figures of leading tire makers, making for easy riding qualities as well as low cost of maintenance. Firestone quick detachable, universal demountable rims with one extra member, are standard equipment. Provision is made for carrying two extra tires, a special holder being arranged at the rear of the chassis and integral with the frame.

The body design is by J. A. Campbell and the new model is distinctive in appearance, having straight line effects and providing liberal space in the front and rear seats. The width of the rear seat is 60 inches, from frame to frame, and that of the inside upholstery 50 inches, providing ample room for three large persons. The depth of the rear seat is 23 inches, and from the back of the front seat to the rear of the back seat is 50 inches. The upholstery is of a high grade, soft leather, and the Turkish cushions are 14 inches deep, filled with the finest curled hair.

The body design is of the fore door type, but four doors are fitted in contrast to the usual blind member. This enables the occupants to conform to traffic regulations in force in some cities which may prohibit entering or leaving the car on the traffic side. An unusually high finish is noticeable, it being stated that 22 coats of paint are required to obtain the mirror like gloss. Squeaking of the body is eliminated by liberally coating the woodwork at points where friction might occur with graphite before the metal is applied. Mountings are white nickel throughout.

Many refinements are added, among which is the placing of the large tool box underneath the running board. It is enamelled inside and out, and the lid is fitted with felt, making it water and weather proof. The equipment is very complete, including best grade mohair top with side curtains and slip cover, electric horn, windshield, four-inch speedometer, special foot rail, swing robe rail, rear tire irons and complete set of tools. Choice of Diamond, Goodyear or Kelly-Springfield 35 by 4.5-inch tires is given.



At the option of the purchaser the new model is equipped with either an electric or acetylene motor starter, both being listed as extra. When the former is employed it is suspended from the two cross members supporting the transmission and is geared by silent chain to the transmission drive shaft flange. When the electric starter is not specified the car is equipped with a dynamo for lighting purposes.

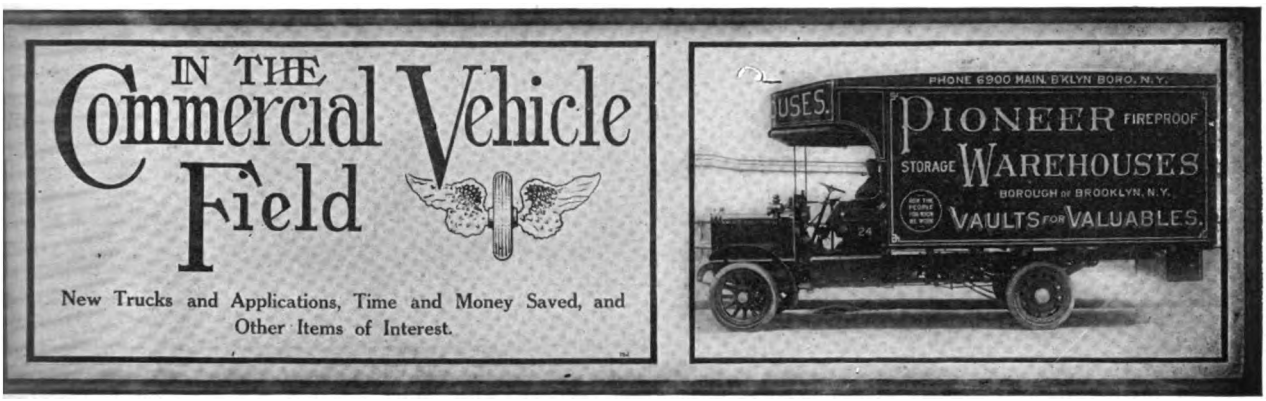
FORMAL OPENING OF RINCON CAUSEWAY ROUTE.

CALIFORNIA'S state highway commission has completed the Rincon causeway, a new sea level route from Santa Barbara to the south, in time for the heavy automobile travel along the coast this winter. Accompanying reproductions of photographs taken by a Pierce-Arrow owner, who lives in the East, give an excellent idea of the completed road, which is in effect a board walk, and will enable the reader to realize in a measure the effort that was necessary to convert this rocky shore into a most delightful motor car drive.

The opening of the route means that instead of the rainy season putting the usual stop to all automobile traffic between Santa Barbara and Los Angeles, the distance may be covered in any season by the lighter machines and unexperienced drivers. Heretofore the only means of covering the distance has been by way of the Casitas pass, the old road that wound around the high hills, which as seen from the new causeway suggest some of the discomforts that have been eliminated.

Some Interesting Views of the Causeways on the New Rincon Road Between Santa Barbara and Los Angeles, Cal., by a Pierce-Arrow Owner.



It was only by co-operation that this undertaking was made possible. Contributions were secured from practically every section of the country, and the help of the chambers of commerce in Los Angeles and Santa Barbara was a big factor. In reality the road is a series of causeways, the first extending from Rincon creek at the base of the mountains for about 2000 feet. A little further another 400 feet was necessary. The longest of all is at Punta Gorda, this extending for 4400 feet.

All the causeways are built of eucalyptus piles, 10 inches or more at the butt and not less than seven inches on the point. These piles are driven at least eight feet into the ground and in places to a further distance to reach a solid foundation Where rock was encountered, holes were drilled in the solid rock to a depth of six feet. The piles are capped with 12x12 timbers, drift bolted into them with .875-inch bolts. The top of the caps is 10 feet above high water. On top of the capping are laid 4x12 stringers and on these three-inch flooring extends over the sides to allow a brace for the rail. The rails extend along both sides of the causeways and are made of 4x12 Oregon pine, braced by a 2x4 and capped by a 2x6 with a 2x4 under the cap.

The old Casitas route, with its many turnings through the hills, covered a distance of 24 miles. The new road not only cuts off nine miles, but eliminates the grades and turns that have been a terror to all motorists using the old El Camino Real. It forms one of the links in the state highway from Los Angeles to San Francisco and will be a welcome addition thereto.

Ohio has thus far this year contracted for the construction of more than 150 miles of road, and 25 miles will be added to this before Jan. 1.

ANOTHER NEW MUNICIPAL WAGON.

Police Department in Detroit Has Specially Designed Dog Catcher's Wagon.

Inasmuch as Detroit is regarded as the centre of the automobile industry, at least in this country, it is not at all surprising that the city officials should seek to solve its many problems through the use of motor vehicles. Not long ago, it will be remembered, the city treasurer was supplied with a novel body, fitted to a Cartercar chassis, in which the city paymaster was able to make his rounds without fear of being molested by thieves, it virtually being a bank on wheels, with the interior securely guarded by steel bars.

An accompanying illustration shows the very newest thing in municipal wagons. The car is fitted to a G. M. C. gasoline chassis, made by the General Motors Truck Company, Pontiac, Mich., and is known as a dog catcher's wagon. The vehicle is attached to the police department, and is designed to rid the city of unlicensed dogs in the most humane manner.

Fourteen cages of differing sizes are provided, making it possible to keep a particularly vicious dog from the others whenever this becomes necessary. Each cage is removable and equipped with a water pan especially designed for this purpose. Since it was placed in service this G. M. C. has impounded an average of 90 muzzleness canines a day. It is anticipated that other cities will adopt this type of municipal wagon as soon as its humane qualities are appreciated.

G. M. C. Dog Catcher's Wagon Recently Placed in Service with Detroit Police Department.

The first of the 1913 Pope-Hartford three-ton trucks, made by the Pope Manufacturing Company, Hartford, Conn., was recently delivered to the Boston service station of the company, making the trip from Hartford loaded with three tons of supplies. The truck left Hartford at 4 in the morning and arrived at Boston at 4:25 in the afternoon, making stops at Springfield and Worcester. At the end of the run Driver F. J. Glaser reported that the entire distance of 130 miles was made on high gear and although the highways were muddy and slippery no adjustments of any kind were made. The gasoline consumption for the trip was approximately 6.5 miles to the gallon, despite the poor roads.

TESTING MOTOR WAGON FOR PARCELS POST.

Whether or not the business of the domestic parcels post will be transacted by motor vehicles eventually, it is of interest to note that the officials of the United States postoffice department have been investigating this phase of the situation in a manner which seems to presage a decision in favor of the automobile industry. It seems that Postmaster-General Frank H. Hitchcock ordered a test of an International autowagon, made by the International Harvester Company of America, Chicago, and that the trial was conducted at Westminster, Md., Oct. 3, practically six weeks after the order creating the parcels post system was approved by President Taft.

International Car Utilized in Parcels Post Delivery Test at Westminster, Md.

A special committee, composed of Robert S. Share, chief postoffice inspector; John C. Koons, superintendent of the division of salaries and allowances; A. A. Fisher, chief clerk of the office of the second assistant postmaster-general; Clarence B. Hurrey, chief clerk of the office of the third assistant postmaster-general, and George L. Wood, superintendent of the division of rural mails, was appointed to meet with H. P. Gorsuch, postmaster at Westminster, and a number of merchants, manufacturers, farmers and others in that city. John T. Coppersmith acted as carrier and John Didderar was driver of the car on this official test. Inasmuch as the new classification of mail matter does not go into effect until Jan. 1, newspapers were used in lieu thereof.

The car, as may be seen from the accompanying illustration, was especially adapted to the work. The body is made of galvanized steel and contains several cabinets, each provided with pigeon holes, and a large receptacle for newspapers and magazines. The cabinets are constructed so as to permit of removal from the vehicle to be carried into the postoffice for filling and emptying. Each is locked with a double-throw lock, and made absolutely dust, water and burglar proof. The car also is self-heated, the exhaust of the motor being diverted to a steel drum for this purpose.

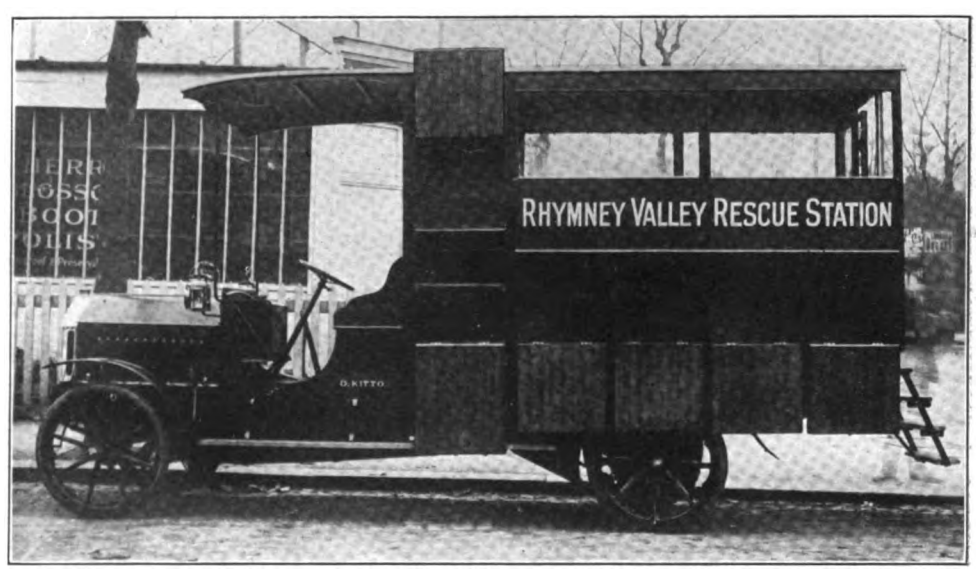
The route selected was over one of the worst sections in the vicinity, but the International wagon experienced no difficulty in conducting the test in a successful manner. At Frederick, Congressman David J. Lewis, father of the bill, saw the first practical demonstration of parcels post delivery and expressed himself as highly pleased with it. No definite information has been made public concerning the results obtained, but there is little reason for doubting that the committee was convinced of the through practicability of this means of transportation as applied to the new mail service.

It is worthy of mention in this connection that the first rural free delivery of mail in this country was made from Westminster. It is fitting, therefore, that this test of the parcels post should take place there.

PROFIT IN MOTOR 'BUS LINES.

Several Instances of Successful Operation in Widely Separated Sections of the Country.

There seems no doubt that a wide awake man capable of estimating transportation requirements and locating accordingly, can find in nearly any part of the country a fertile field for the motor 'bus. KisselKars, made by the Kissel Motor Car Company, Hartford, Wis., are thus used in all sections of the United States and reports indicate that in every instance the owner is operating at a profit.



Digitized by Google

A KisselKar line from Newburg to Cornwall, N. Y., paid so well that the owner added a second line from Port Chester to White Plains with equal success. Other recent instances of profitable operation of KisselKar 'buses are cited at Joliet, Ill.; Albany, N. Y.; Clarksburg, W. Va.; Highland Park, Ill.; Lynn, Mass.; Chicago, Minneapolis and Detroit. Many of these concerns purchased the chassis only from the Kissel company having bodies built and mounted in their own cities and according to their ideas and the requirements of the individual installation.

PROTECTING LIFE IN THE BRITISH MINES.

The British government has taken a step which does not appear to have been considered seriously in this country. In 1910 Parliament passed an act compelling all colliery operators to maintain a motor vehicle in constant readiness for the supply and maintenance of ambulance service. In compliance with this act at least two rescue stations, those at Rhymney valley and Aberaman, have acquired machines made by the Lacre Motor Car Company, Ltd., London and Letchworth. One of these is shown in an accompanying illustration, and will prove of interest.

These machines are fitted to the regulation 38 horsepower chassis produced by the Lacre company, and the most interest naturally attaches to the body equipment. As will be noted the general appearance is that of an ambulance, and it differs principally in the provision for carrying the necessary oxygen plant and other rescue appliances. These cars are the first to be placed in service in Great Britain in compliance with the law.

Lacre Vehicle of British Manufacture Fitted for Service with Colliery Rescue Station.

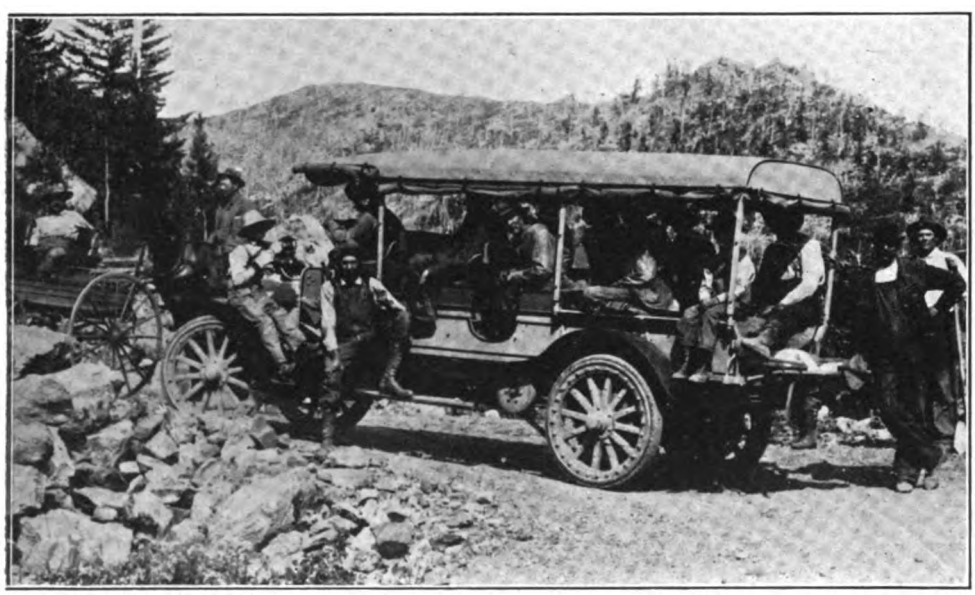
The interior is arranged to accommodate 11 men. Separate compartments are provided for 11 sets of draeger outfits, these being disposed along the sides in the spaces to which the covers have been opened in the photograph. Four oxygen cylinders are carried in the compartment directly underneath that for the draeger outfit back of the driver's seat. Four pulmotors are located immediately under these, and at the extreme rear. Tools are carried in another compartment directly over that occupied by the draeger outfit back of the driver. A well is accessible from the interior by lifting four hinged doors, and in this are carried potash cartridges and hand lamps. A pump and extinguishers may also be carried.

NEW FIELD FOR STEWART CARS.

Buffalo Bank Finds Many Uses for a Vehicle of the Light Delivery Type.

T. R. Lippard, president and manager of the Stewart Motor Corporation, Buffalo, N. Y., maker of Stewart light delivery wagons, states that the Merchants National Bank of Buffalo has purchased a Stewart car, although it might be supposed a bank would have very little use for such a vehicle. "This car," he says, "is used by several departments of the bank. The safety deposit department utilizes it for calling for and delivering valuable articles. It is also employed for making collections at various banks and for delivering currency at numerous factories for their payrolls.

"The car is equipped with specially patented



Digitized by Google

locks, opening from the inside, and the interior is protected by a hinged grating behind the front seat, as well as by bars over the windows and doors. The bank finds the car a great saving and other banks are adopting similar vehicles. We look for a great business in this field."

LARGEST TRUCK FOR MINE WORK.

California Concern Produces Specially Designed Vehicle for Use in Arizona.

The F. L. Moore Motor Truck Company, Los Angeles, Cal., has just completed a truck especially constructed for the Kay Copper Company of Phoenix, Ariz., and which is said to be the largest of its kind ever built. It will be used for hauling the copper ore from the mines to the smelter.

One-Ton Federal Truck Employed by J. W. West in Operating a Motor Stage Line Between Idaho Springs and Alice, Col.

The truck has a 100 horsepower, four-cylinder engine, with large bore and long stroke, which allows it to run at very low speed. The frame of the vehicle is made of steel girder heavily reinforced. It has a special patented power-dump attachment which will work by the power of the engine in nine seconds, and which is controlled by the driver from the seat. The front wheels are 42 inches in diameter with wooden tires six inches thick and 13 inches wide. The total weight of the truck unloaded is 11,480 pounds. It will be loaded to seven or eight tons capacity and will pull trailers carrying the same amount of load.

FEDERAL UNDERTAKES SEVERE TASK.

Operates as Motor Stage and Mail Wagon Over Winding Road at High Altitude.

A few months ago J. W. West of Idaho Springs, Col., purchased a one-ton Federal truck from W. W. Barnett, Denver agent for the Federal Motor Truck Company, Detroit. It was put into service as a motor stage and mail wagon, running from Idaho Springs to Alice, a distance of 11 miles. During the first three months of service it had not cost the owner one cent for repairs.

Some idea of the grades the vehicle is called upon to negotiate may be gained from the fact that the gradometer registers a pitch of 20 to 25 per cent. in places. The road twists and turns over a very rough course that formerly was used only as a trail. The car makes two trips a day, carrying mostly miners to the silver mines in that region.

The chassis is a regulation model D Federal, and is equipped with a combination body, having three cross seats which will accommodate nine passengers, and about four square feet of space in the rear for baggage and mail. Mr. West declares that although other dealers in Denver did not care to undertake the installation, the Federal has never missed a trip or been laid up for a moment on account of repairs.

EFFICIENT OPERATING METHODS.

Results Obtained by Fifth Avenue Coach Company of Value to Motor Truck Owners.

The Fifth Avenue Coach Company of New York City has filed its official annual report with the public service commission of the state, which well illustrates the possibilities of increasing the efficient operation of a fleet of motor vehicles.

Digitized by Google

This report discloses a policy of retrenchment and economy, which greatly reduced operating expenses without affecting the service rendered to the general public. One of the principal savings came in reducing the number of "idle" miles covered by the motor 'buses in travelling between the garage and their starting points, from 23,000 miles to 5951 miles in a year. This was accomplished by erecting several garages and stations so that the 'buses could be kept very near their starting points.

Another economy was in the matter of tires, the expense having been reduced from $67,563.96 to $45,124.51, despite a greater mileage, and the cost of tires a vehicle amounted to 3.13 cents, against 4.98 the preceding year. One of the principal reasons for this showing, as assigned by President Meade of the company, was the purchase of tires outright instead of buying the mileage. He holds that this is something for users of commercial motor vehicles to study.

WILL DISSEMINATE INFORMATION.

Motor Truck Club to Take a Prominent Part in the Promotion of the Industry.

The Motor Truck Club of New York City has decided to establish a permanent office at 1845 Broadway in charge of a salaried staff, and to actively engage in the collection and dissemination of motor truck information for the benefit alike of makers, dealers, owners and prospective buyers; in fact to become the metropolitan centre of motor truck interest. The management of the body will remain in the hands of the executive committee and regular standing committees have been appointed to assist in the work. Among the more important recommendations adopted are the following:

That a registry of motor truck drivers be established which shall investigate the records of drivers as to their efficiency, experience, etc., and this information to be available only to members of the club; that a bureau of information be formed; that a special committee be appointed by the president to consider the question of affiliating with the New York Chamber of Commerce, the Automobile Board of Trade, the National Association of Automobile Manufacturers and the Automobile Club of America.

President Fenner has appointed the following committees:

Executive—D. C. Fenner, Jr. (International Motors Company), C. E. Stone (Peerless), E. Lascaris (De Dion), E. O. Hoopengarner (Swinehart tires), A. N. Bingham (International), Arthur J. Slade (Atlantic), E. W. Curtis, Jr. (G. V.), L. A. Van Patten (Alco), Ellis L. Howland (Journal of Commerce), Harvey Robinson (New York Edison Company), Emerson Brooks (Remington), F. B. Porter (Chase).

Programme—C. E. Stone, A. N. Bingham, A. J. Slade, L. A. Van Patten.

Contest—E. Lascaris, George H. Duck (Alco), Henry S. Otto (International), W. H. Stewart, Jr. (Stewart Auto School), Frederick L. Colver (Locomobile), N. Mallouf (Peerless).

Finance—E. O. Hoopengarner, R. T. Allcott (Knox), F. W. Dix (Pope-Hartford).

Membership—A. N. Bingham, F. B. Porter, Robert C. Reid (Pierce-Arrow).

Publicity—A. J. Slade, John R. Eustis (New York Evening Mail), M. J. Adams (Alco).

Traffic—E. W. Curtis, Jr., T. A. Aspell (Goodrich tires), C. W. Fletcher (Walter).

Nominations—L. A. Van Patten, A. B. Cumner (Federal), A. W. Robinson (Locomobile), P. W. Gaylor (KisselKar), T. A. Aspell.

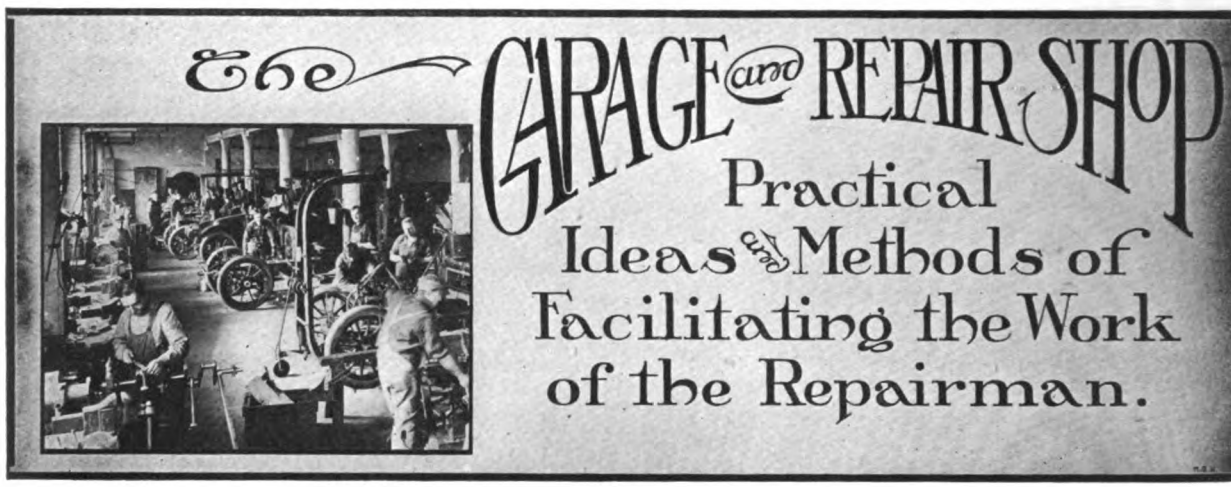
Publication—Ellis L. Howland, C. E. Stone, A. B. Cumner.

Welfare and Interest—L. A. Van Patten, E. W. Curtis, Jr., Emerson Brooks, A. J. Slade, Ellis L. Howland.

Motor Truck Show Luncheon—A. J. Slade, E. W. Curtis, Jr., John F. Plummer (Locomobile), Karl L. Frederick (Packard), Robert C. Reid, Percy W. Barton (Peerless), F. W. Croxton.

Club Emblem—Harvey Robinson, C. W. Fletcher, J. M. Charles (International).

Affiliations—Emerson Brooks, E. Lascaris, A. Masury, A. W. Robinson, A. B. Cumner.



Civic Relations—F. B. Porter, E. W. Murphy (Patterson transmission), P. K. Hexter (Gramm), C. M. Curran (International), C. A. Stewart (Automobile Dealers' Association), Oscar W. Shadbolt.

R. H. Macy & Co., a well known New York City dry goods firm, has taken delivery of 15 Chase motor delivery wagons of 3000 pounds capacity each, made by the Chase Motor Truck Company, Syracuse, N. Y. They are stationed at the company's stable at Woodlawn, the Bronx, where they have displaced about 60 horses. These vehicles are making daily deliveries over a wide territory, including the upper Bronx, practically all of Westchester county and nearby Connecticut. The Macy company has been using Chase trucks for 2.5 years and this last purchase represents a third repeat order.

So convinced are the authorities of the Kansas Agricultural College that the motor car is and will continue to be one of the most important factors of farm life that they have established a course of motor engineering. Lectures by professors and by experts from motor car factories go into every technical detail of construction. Machines are taken apart and put together again, the principles of mechanical engineering as applied to the construction of cars being exemplified, and emphasis is laid upon repair methods.

Melbourne Phillips, 15 years old, has just completed a 2000-mile drive from Orlando, Fla., to Salida, N. C. The trip was made in a Studebaker "30," which also carried Melbourne's mother and his two smaller brothers.

CARLTON ALL-FUEL CARBURETOR.

Some time ago attention was called in these columns to the development of the heavy fuel vaporizer abroad and to the compactness of one design, that of the Durr. A device that is claimed to be even smaller than the Durr is the Carlton all-fuel carburetor, an English design, mention

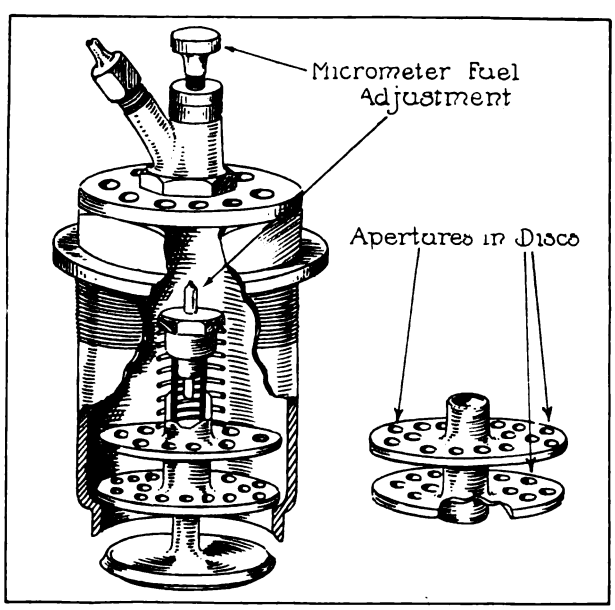

Fig. 1—The Carlton All-Fuel Carburetor, a Valve Type of Vaporizer Having Double Discs.

of which was made in the recent issue of the Commercial Motor.

A quality emphasized of the Carlton is that gasoline, benzol or kerosene may be successfully vaporized, although starting is not possible with the heavier fuel without resorting to heating. As will be noted by the drawing presented at Fig. 1, the vaporizer is of the valve controlled type and the principle of operation is said to be such that the several fuels may be successively employed without any alteration or adjustment, and with a clean exhaust.

It will be noted that the feed may be regulated by a screw arrangement and that the needle, which is spring mounted in the top of the induction valve itself, sits directly into the bottom orifice of the fuel pipe. The feed arrangement is therefore extremely simple, and as ample means of adjustment are provided, there is practically nothing to do after the first setting.

One of the interesting features of the vaporizer is the double-disc baffle plate, in which a large number of holes are so drilled relatively as to be in no sense opposite to each other. This results, it is stated, in a high degree of atomization of the fuel as it is drawn past the discs and onwards into the induction pipe.

RENEWING TEETH IN FIBRE WHEEL.

The repairman is often called upon to exercise his ingenuity in making repairs, especially when the owner cannot wait for a new part to be shipped from the factory. An instance of this kind occurred recently when a fibre timing gear became damaged through a small piece of metal getting between its teeth when the motor was operating.

A piece of square fibre was secured, this being slightly wider than the thickness of the wheel. The latter was then sawed as shown at Fig. 2 B and the surfaces smoothed up with a file. The block of fibre was cut to make a driving fit, after which a template was made from the good teeth, for marking off the required members on the insertion. These were cut with a hacksaw, smoothed and trued with a file, after

Digitized by Google

which two circular brass plates were turned up and placed in the position shown at C. The plates were then secured by rivets.

PISTON RING CLAMP.

While it is an easy matter for the workman to replace a cylinder over the piston rings when aided by his helper, it is sometimes troublesome when the work is attempted alone. There are various methods employed, also clamping devices, but that illustrated at Fig. 2 E is of particular value in that it may be operated easily and individually.

It is made from sheet metal, rolled to the form shown at D and provided with two wings or extensions to take a threaded bolt carrying a wing nut. The clamp is slipped over the piston and rings, and the nut screwed up, compressing the rings into place. The cylinder is then slid over the piston, and the tension of the clamp relieved. As the cylinder moves downward, it will slide the clamp along. The piston should be well lubricated before the device is secured to prevent binding.

MAKING A VALVE LIFTER.

The average repairman has in his tool kit a valve lifter which he prizes, in that it is suitable for the majority of motors. Occasionally, however, a car will come into the shop to be overhauled and upon disassembling the motor it will be found that the regular valve lifter does not accomplish the work easily.

A simple form of tool for compressing valve springs while retaining key is withdrawn, is presented at Fig. 2 A. It is a common type, but as it is easily made it may be of service to some workman who encounters an engine not adapted to the regular lifter. It will be noted that the fulcrum member is provided with a number of holes for adjusting the lever to varying heights of the cylinders. The retaining bolt is threaded at one end to take a wing nut. The material can usually be secured from the scrap heap.

MORGAN TOOL HOLDER.

A handy tool holder, in that it combines the function of a number of similar devices, is the Morgan, manufactured by B. Morgan of Newport, R. I., and shown at Fig. 2 F. It is made in three sizes, A, B and C, respectively, A and B being designed for service with tool post holders on 12-14 and 10-12 inch lathes.

The holder is constructed from hardened steel, accurately machined, and will hold securely round, flat, square, hexagon and shaped tools in the tool post from the largest size of tool to a No. 60 drill. The two machined parts are held together by a slotted link, keeping them parallel as regards side motion, but allowing the two parts of the holder to swing around to a straight line and to reverse their position.

The heavy portion of the holder has a deep V slot on one side and a hair line on the opposite, while the smaller or lighter bar has a V slot on one side and is plain on the other. The V slot in the lighter portion registers with the deep V slot in the heavy section, which enables large tools to be held. When the tool is reversed the small or hair line slot has a plain or blank bar opposed to it, enabling the clamping of the lightest of drills. A complete set of tools is manufactured, there being 11 in all, and the sizes vary according to the equipment. At G is shown the holder on the square and with a diamond point inserted.

GARAGE AND REPAIR SHOP EQUIPMENT.

WESTERN ROADWAY FILLING OUTFIT.

There is profit to be derived in the sale of gasoline if the equipment for handling it is such that little time is lost by the attendant in supplying the needs of the customer. When the tank is located within the garage and the fluid has to be drawn in five-gallon lots and carried out to the car, considerable time is lost in the operation. Sometimes it is necessary to search for a funnel to fit the opening of the car's tank.

The Western Oil Pump & Tank Company, St. Louis, Mo., is marketing an equipment known as the roadway filling outfit, illustrated at Fig. 3, the views depicting the device closed and open.

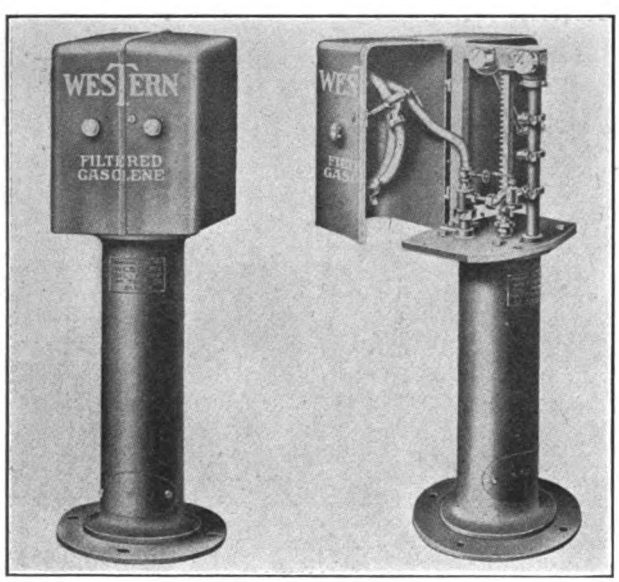

Fig. 3—The Western Roadway Filling Equipment: At Left, Showing Doors Closed; at Right, the Pump Ready for Service.

It is designed for bolting to the sidewalk near the curb and the pumping apparatus is enclosed by a cabinet mounted upon a hollow metal column. The cabinet is constructed of a heavy gray cast iron and all bolts and connections are inside, preventing the possibility of tampering.

The double doors are hinged and swing backward, permitting of easy access to the mechanism, overlap when closed, and are fitted with a Yale lock. A two-way nozzle is attached to six feet of steel lined hose, permitting use of the hose when the tank of a car is to be filled as well as with the usual five-gallon can. A swivel coupling allows the nozzles to be turned to either side and they may be utilized independently of each other, or both may be in use at the same time.

Special provision is made for separating all water and foreign elements from the gasoline. A gravity filter is connected to the base of the cylinder and is made an integral part of the pump. All impurities are collected in a chamber which is accessible through a small door. Means for draining are provided.

The pump is of the long distance type, measuring gallons, half-gallons, quarts or pints at one stroke of the handle. All parts are constructed of high grade material. The pump is equipped with a meter that keeps an accurate account of all fuel drawn up to 10,000 gallons, at which point it reverts to zero. Every tenth of a gallon drawn is denoted. The pump and cabinet are finished in vermilion enamel with nickel trimmings. The height is 52 inches.

WILLIAMS TIRE REBUILDING STAND.

With proper equipment the work of repairing tires is greatly facilitated. The Williams Foundry & Machine Company, Akron, O., maker of tire repairing equipment, is manufacturing a tire rebuilding stand which is a great saver of time in that the shoe to be repaired may be quickly mounted and easily handled during the operation.

As will be noted by the illustration presented at Fig. 4 the device comprises a regular clincher rim upon which the tire to be repaired is mounted. It may be secured in this manner or on one of the company's regular retreading rims with a coil inside the casing, or with the special reliner building form.

When the retreading rims and coils are utilized the old tread may be torn off and the carcass roughed, the new tread applied, rolled down, and the wrapper applied without removing the casing from the stand. The tread rolling attachment includes five tread rollers, the one fitting the tire being placed upon the spindle. The levers are so arranged that the rollers will swing down below the tread on each side. They are pressed against the tread when the tire is revolved by hand.

The casing may be adjusted to any angle. Pressing upon the pedal releases the ratchet flange at the end of the spider shaft so that the shoe may be swung to the desired position. Releasing the pedal locks the tire. A reversible ratchet attached to the spider permits the tire

Digitized by Google

to be revolved in either direction or locked. The table is adjustable and may be swung to either side of the stand and a feature of it is that the required tools are always accessible, a quality making for economy in that time is saved. The stand is constructed of high grade material.

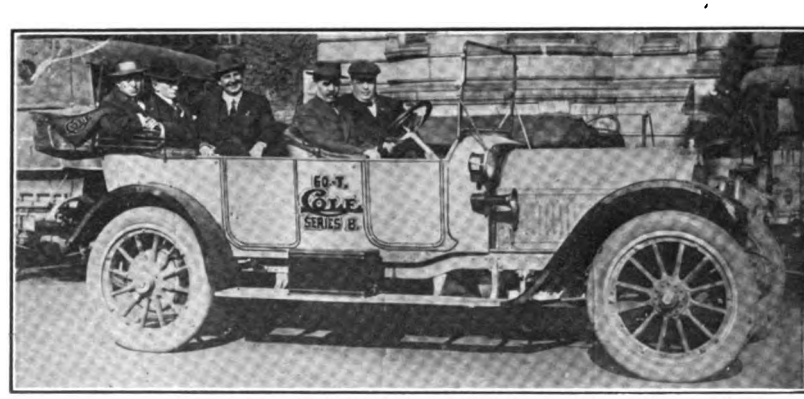
STEAL MARCH ON PRESIDENT COLE.



Incident Serves to Illustrate How Well Cole Sales Force Watches the Factory.

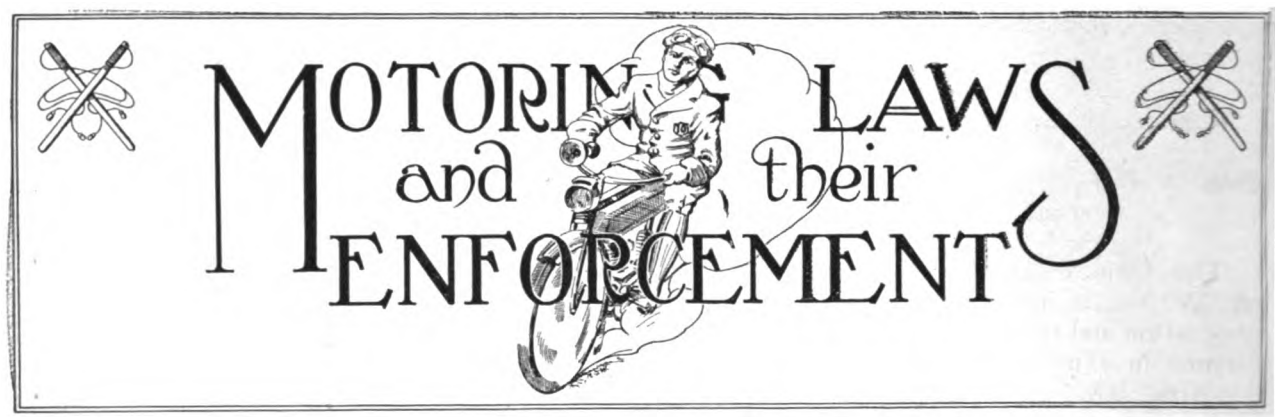
For over two years President J. J. Cole of the Cole Motor Car Company had been hiding the secret that he was to produce a six-cylinder model. The Cole sales department, although it keeps in the closest touch with the factory, had been unable to get more than a confirmation of the rumor.

Recently Mr. Cole, off his guard for a moment, drove down to the Columbia Club in Indianapolis, in his new six-cylinder, 60 horsepower Cole. Two days later he received a telegram from W. S. Gotshall of St. Louis, as follows: "Coming in private car with 20 to see Cole 60." The next day similar telegrams were received from New York, Boston, Cleveland, Louisville, Chicago and Newark. President Cole said:

"Well, they stole a march on me this time, but I am thoroughly satisfied with the 60. I believe that the automobile industry has a future and so there is more and more perfection waiting for us over the hill. But this series eight comprises the best cars I have ever built.

"I will have to wait until many months of correspondence comes in before the public can improve on it. I say the public because automobile owners have built this car. My distributors send me everything they hear about automobiles. Our mail is carefully scrutinized in order to find out what the public needs. That is why I do not blame the distributors in the field for stealing a march on me. They beat me by one day."

President J. J. Cole at the Wheel of the Latest Six-Cylinder, 60 Horsepower Cole Model.



TO REVERSE GLIDDEN TOUR.

Committee Expected to Make This Decision with Reference to Next Year's Contest.

After a canvass among the various A. A. A. officials comprising the Glidden tour committee, it seems quite likely that the governing body will route next year's contest over a reverse route. Starting at New Orleans, La., and terminating at Detroit, the manufacturing centre of the automobile industry, the tour would be an ideal one. The resolution made at the recent meeting of the National Association of Automobile Manufacturers will no doubt operate to enlarge the list of entries.

Chief among the reasons for the revision of the route is the fact that the tourists will drive away from a hot climate into a comparatively cold one. June 10 being the starting date, New Orleans folk will begin journeying north to escape the hot summer months. Many of these are possible entrants. It would also be more convenient for easterners to ship their machines to New Orleans by water than to Detroit by rail.

GRADUATED FEES IN INDIANA.

Possibility of Securing $175,000 to $250,000 a Year Interests Senator Netterville.

Senator J. J. Netterville of Anderson, Ind., has been looking over the motoring laws in the other states and believes Indiana needs a graduated annual license for automobiles and fees for chauffeurs and manufacturers. At present the only requirement of the Indiana law in this respect is a perpetual registration with the secretary of state at a cost of $1. Senator Netterville expects that his proposed bill will net the commonwealth between $175,000 and $250,000 for good roads.

The proposed schedule of license fees is as follows: Cars of less than 25 horsepower, $5; 25-35, $10; 35-50, $15; over 50, $25; chauffeur, $5 for first two years and $3 a year thereafter; manufacturers, $10. The bill also will contain the following speed provisions: Business districts, 10 miles an hour; residence sections, 12; outlying districts, 15; open country, 25.

DRIVING LICENSES IN PENNSYLVANIA.

Provisions of the New Statute Will Go Into Effect Jan. 1—Annual Fee of $2.

After Jan. 1 every person operating an automobile in Pennsylvania, with the exception of registered owners, must procure a driver's license, the fee for which is $2. Heretofore a registered owner could designate any member of his family over 18 years of age to drive his car, or any friend or person not in his employ as a chauffeur. Joint ownership registration also will be discontinued.

Applicants for registration for 1913 must furnish the name, model, year manufactured, S. A. E. rating, diameter of bore and number of cylinders, in addition to the information previously demanded. Blanks for the new year have been received by the several bureaus of the Pennsylvania state highway department and the work of registration may be said to have begun.

CALIFORNIA TRUCK MEN WIN.

Motorists Confer with Secretary of State Concerning Provisions of New Law.

The recently organized Motor Truck Club in Los Angeles, Cal., appears to have justified its existence in the matter of securing proper consideration before the city council. The latter body had prepared an ordinance requiring a local tax on commercial motor vehicles, based on the horsepower rating. After a conference with the city attorney the ordinance has been amended on the tonnage basis as follows: Motor trucks of less than one ton capacity, $5 a year; one to two tons, $10; two to five, $20; more than five, $25.

In this same connection it is interesting to note that the secretary of state recently called upon representatives of the Automobile Club of California with reference to the proposed new state registration law, which was passed by the legislature last spring and failed to secure the approval of Gov. Johnson. An attempt is to be made to revive this bill at the forthcoming legislative session.

At present California owners are required to register their machines but once, the fee being $2. The new law would provide for the following annual fees: Less than 20 horsepower, $3; 20-30, $5; 30-40, $7.50; 40-50, $10; 50-60, $12.50; over 60, $15; motorcycles, $2; manufacturers and agents and dealers having the whole state territory, $25; agents and dealers with less than en-

Digitized by Google

tire state territory, $10. The motorists claim the fees are excessive, particularly as they apply to old and new machines alike.

AMENDMENTS IN WEST VIRGINIA.

Ohio Valley Automobile Club Seeks Action Against Intoxicated Drivers.

The Ohio Valley Automobile Club, Wheeling, W. Va., is enlisting the support of the state association and the members of the incoming legislature in a proposition to amend the present motoring law. Special attention is being paid to three matters which are considered of the utmost importance—making it unlawful to drive an automobile while intoxicated, prohibiting the throwing of glass and other sharp pointed articles in the roads, and forbidding the use of muffler cut-outs and the making of other unnecessary noises. The provision against intoxicated persons reads as follows:

No person when intoxicated shall operate a motor vehicle, and any person guilty of so doing shall be subject to a fine of not less than $100 nor more than $300, or imprisonment for not more than one year, or both; and the license of any person guilty of a violation of this section may be suspended for six months by the highway commissioner.

MICHIGAN LAW CONSTITUTIONAL.

Supreme Court Holds Section Concerning Owner's Liability Is Proper Legislation.

The motoring law in Michigan, passed in 1909, contains the following section: "The owner of a motor vehicle shall be liable for any injury occasioned by the negligent operation by any person of such motor vehicle, whether such negligence consists in violation of the provision of a statute of this state or in the failure to observe such ordinary care in such operation as the rules of the common law require; but such owner shall not be liable in case such motor vehicle shall have been stolen."

In a recent case, carried to the supreme court, the defendant contended that this section was unconstitutional. The court holds otherwise, the decision being as follows, in part: "It is well recognized that the automobile on the highway in the hands of an incompetent or a reckless driver may result in great injury to persons and property. Because of this fact the state, in the exercise of its police power, may pass statutes in relation to the ownership of automobiles and the running thereof."

IMPORTANT BAY STATE DECISION.

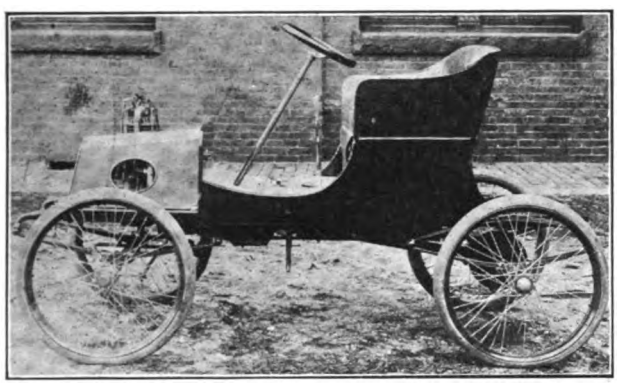
Supreme Court Holds That Drivers Must Pass Street Cars on the Left.

Justice Braley of the Massachusetts supreme court has written an opinion, in which three other members of the court agree, construing the law of the road as passed in that state in 1820 to compel the driver of an automobile or any other vehicle to pass street cars on the left. The decision was handed down late last month, in the suit of J. Sidney Foster against Thomas P. Curtis, in which the plaintiff sought damages for personal injuries as the result of being struck by the defendant's automobile when alighting from a street car in Broadway, Revere.

With this majority opinion three members of the court, including Chief Justice Rugg, dissented. The majority opinion holds that a street car is a vehicle within the meaning of the law and takes cognizance of the fact that in many places street car tracks are laid at the extreme edge of the highway. It adds: "The requirement, however, is only that the passing vehicle shall 'drive to the left of the middle of the travelled part of the way,' and, as we have pointed out, where the jury finds the circumstances to be such that in the exercise of reasonable care the statute could not be literally obeyed, no inference of negligence can be drawn."

The dissenting opinion holds that to interpret the statute literally would occasion unnecessary traffic congestion. The majority opinion contends that if this be true, it is not possible to disregard the express requirements of the statute and that it is for the legislature to provide a remedy. The minority holds that: "A penal statute cannot be interpreted so that it cannot be obeyed, or so that it will require further legislation to make it workable unless no other course is open. We think it was plain that the legislature did not intend to include electric cars or horse cars within the law of the road."

William A. Thibodeau, attorney for the Automobile Legal Association, has prepared a bill amending the law of the road so as to eliminate street cars from its provisions.



The recently enacted ordinance requiring lights on all vehicles utilizing the highways of the city at night, went into effect in Columbus, O., Dec. 1. For a week before that date owners were busy purchasing lamps in order to comply with the new law.

PIONEER AMERICAN GASOLINE AUTOMOBILES.

Third Installment of the Industry's Early History---Some Cars Which Have Seen Long Service---First Friction Driven Model---Selden-Ford Litigation.

INTEREST in gasoline automobiles gained rapidly during the last few years of the 19th century. All over the country exhibitions were

Single-Cylinder Cameron Car of 1901, with Novel Method of Housing Vertical Engine.

being held for the purpose of bringing these machines to the attention of the public. In many instances prizes were offered for those which would make the best showing in some one form or another. It was in connection with an announcement concerning one of these exhibitions at an agricultural fair near Providence, R. I., in 1898, that the Scientific American was moved to suggest, editorially, that no infant industry had been encouraged as had this one and that the results to date did not indicate that the sums thus expended were warranted.

In 1900 a published list of those engaged in the manufacture of automobiles in the United States contained no less than 271 names and addresses. This list was by no means complete, since it did not include concerns or individuals who are now prominent in the industry and who are known to have been producing cars previous to that date.

The Crestmobile.

Isaac H. Davis, now of Dorchester, Mass., became interested in the horseless carriage in 1898 on account of work done in connection with the first organized indoor exhibition of these vehicles arranged by the Massachusetts Charitable Mechanics Association in Mechanics building, Boston, in September. Later that same year he offered a number of prizes for a speed contest at Charles river park. The following year he organized the Crest Manufacturing Company in Cambridgeport, Mass., for the manufacture of gasoline automobiles.

The first Crestmobile was a tricycle, with a single-cylinder, three horsepower, air-cooled, vertical motor at the rear. This appeared in 1899. Two years later the vehicle was mounted on four wire wheels, and the motor was directly in front of the dash and the forward axle. Steering was by tiller post located at the right of the driver. Drive was through a "clutch transmission fastened to reaches with universal joint bearings."

In 1902 the company brought out a two-cylinder opposed motor, in two sizes—four and five horsepower. This was located under the floor and also was of the air-cooled type. It was offered complete with induction coil, muffler, spark plugs, dry battery, carburetor and tank for $240. With this outfit was furnished a special frame suitable for fitting to all types of running gears. The Crestmobile car of that year was equipped with a steering wheel and control lever at the driver's right.

Several of these vehicles were sold to physicians; indeed, the firm's advertising strongly recommended a car of this type for such work. In 1904 the company paid all its debts, ceased to manufacture cars and went out of business.

The Original Oldsmobile of 1899, Designed by R. E. Olds.

About the same time E. S. and F. Cameron, two brothers, who were engaged in the manufacture of bicycles in Brockton, Mass., turned

Digitized by Google

their attention to experimentation with steam vehicles. In 1901 they brought out the air-cooled gasoline car shown in an accompanying

The Oldsmobile Runabout of 1902, Many of Which Are Still Giving Good Service on the Road.

illustration. This was decidedly novel in appearance, largely because of the provision for housing the engine, if housing be the proper term.

The motor was rated at six horsepower, and no fan was used for cooling. A sliding gear transmission afforded two forward speeds and reverse, and final drive was by bevel gears to the rear axle. The connection with the transmission case was by means of a large radius tube, hinged to the case so as to permit the rear axle to swivel. This is maintained to be the original application of this construction. The driver was placed at the left and the control lever was in the centre. Steering was by wheel. Attention also should be drawn to the starting crank on the side.

In the second model, produced in 1902, the engine was lowered and the fan was added to the cooling system. The same general construction was employed as in the earlier car, but the gear shifting lever was attached to the steering wheel post. This model was continued, substantially without change in 1903, and in 1904, the first four-cylinder car of this make was produced.

Pioneer Oldsmobile Models.

Although it appears that R. E. Olds was experimenting with gasoline automobiles as early as 1886, and is credited with having been connected with the industry since 1896, the first Oldsmobile seems to have made its appearance in 1899. This was a decidedly pretentious vehicle when compared with some others of the same period, as may be gathered from the photograph reproduced herewith. The Oldsmobile was not marketed, however, until 1901, and the model of 1902 will long be remembered as a thoroughly practical car. Several of them were sold in this country and they were used by men of prominence, including members of the diplomatic corps in Washington. In fact, a large number of these Oldsmobiles of 1902 are still in use and are giving excellent service in the hands of their owners.

The motor was a single-cylinder, four-cycle unit with bore of 4.5 inches and stroke of six, and was rated at 4.7 horsepower. It may be said that it developed remarkable power for its size, as can be testified to by several men who are now em-

Transition from Oldsmobile Runabout to Rear Entrance Tonneau in 1904, Marking a Decided Advance Toward the Oldsmobile of Today.

Digitized by Google

ploying them as stationary engines, for sawing wood, cutting ensilage, etc. The make and break contact for the jump spark ignition apparatus

First Friction Driven Machine, Produced by J. W. Lambert.

was operated from the camshaft, being disposed just back of the worm gear which drove it.

The underframe consisted of two six-leaf longitudinal side springs each five feet six inches long, arranged parallel at a distance of 30 inches, and rigidly secured to axles at either end. The motor and moving parts rested on a three sided angle steel frame or central portions of the springs below and within the body of the carriage. The planetary transmission was located on the main shaft. The water circulation system was controlled by a rotary pump operated from the shaft through a flexible joint. The radiating tubes were arranged horizontally across the rear of the chassis, the cooling being effected without the use of fins or ribs.

The starting crank was fixed permanently to the side of the body, and turned a shaft parallel to and at the rear of the clutch shaft. This transmitted a rotary movement to the main shaft through a chain and sprocket arrangement, and when the engine turned over under its own power the starting shaft was automatically thrown out. Tiller steering was employed, the driver sitting at the right.

The illustration presenting two cars shows the transition from the Oldsmobile runabout to the rear entrance tonneau in 1904. There is a wide difference between the Oldsmobile models of 1904 and those for 1913. And the same may be said of the product of the original designer. There does not appear to be much resemblance between R. E. Olds' car of 1899 and his latest production in Reo the Fifth.

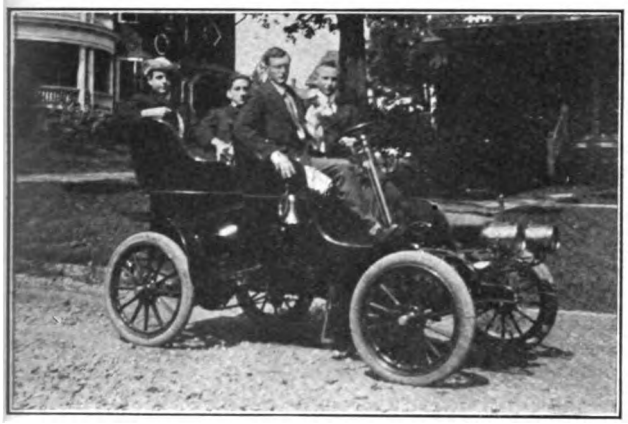
The Lambert Friction Drive.

J. W. Lambert, now treasurer of the Buckeye Manufacturing Company, Anderson, Ind., maker of Lambert cars, was a successful manufacturer in that city 20 years ago, when he began experimentation with gasoline automobiles. Undoubtedly he received much the same encouragement from his friends and neighbors as many of the others who have found success in this new field. At that time he was trying to perfect a three-wheeled car that would be practical. It appears that his early investigations were conducted along lines similar to those already described, with the more usual type of gear transmission. And he made a successful three-wheeled car of this type, only to become convinced that something better was possible.

The result was the first friction driven machine, produced somewhere about 1900. If his neighbors and friends were inclined to look with disfavor upon his first experiments, he met with decided rebuff from other inventors, designers and constructors with his new idea. It is stated that the principle involved in the Lambert patented friction transmission has not been changed since its inception. The first cars of this type utilized cast iron discs. Later aluminum was substituted. But this is simply a matter of detail. Fifteen Lambert friction driven cars were produced in 1900, and in those early days this was an output of importance.

The Shaft Driven Autocar.

The Autocar Company, Ardmore, Penn., lays



First Shaft Driven Model, the Product of the Autocar Company.

claim to having produced the first shaft driven gasoline automobile in America. This made its appearance in 1901. This was the same concern

Digitized by Google

as that which produced the first gasoline delivery wagon on a commercial basis in 1897 as mentioned in the last issue. The company had been

Second Model of the Cadillac, Marketed in 1903.

experimenting with both pleasure and commercial cars for some years, previous to the appearance of the shaft drive.

It would prove impossible and impractical to illustrate or describe the first models of every car now being produced in this country. At the beginning of the 20th century the industry was well founded. But comparatively few cars were being made, it is true, and only those possessed of means were looked upon as possible purchasers. Many men foresaw the splendid future, however, and a majority of the best known makers today date their production from this time.

The Cadillac of 1903 presented herewith gives an excellent idea of the type of gasoline automobile being produced at that period. The first Cadillac was marketed in 1902, and the car shown was still in service a few years ago when the photograph was taken. This is true of many of the machines constructed about the same time. Manufacturers and owners agree that the life of the average American gasoline automobile has by no means been determined as yet.

The Selden Patent Litigation.

In the first installment of this review, appearing in the issue of The Automobile Journal for Nov. 10, mention was made of George B. Selden's invention of an internal combustion motor in 1877. The application for a patent on this engine was filed in 1879, and the patent was granted in 1895. It does not appear that Selden began the manufacture of motor vehicles at that time; at least, none was offered to the public.

In 1899 Selden granted an exclusive license under his patent to the Electric Vehicle Company of Hartford, Conn., then engaged in the manufacture of Columbia cars. Later suits, alleging infringement, were brought against a number of makers then in the field. Chief among the defendants was the Winton Motor Carriage Company, which recognized the validity of the patent and with 10 other automobile manufacturers formed the Association of Licensed Automobile Manufacturers, March 5, 1903. These and their subsequent associates were granted licenses under the Selden patent, and for nearly eight years thereafter "Licensed under the Selden patent" became a trade term.

But by no means all of those in the industry were willing to concede the claims made by Selden, the Electric Vehicle Company, or the A. L. A. M., as the association became known. Other suits were brought, among the defendants being the Ford Motor Company.

The Suit Against Ford.

As stated in the last installment Henry T. Ford began experimenting with gasoline automobiles in 1893. It was not until 10 years later, in 1903, that he organized the Ford Motor Company and began producing machines in a commercial way. The original Ford machine, upon which the Selden patent suit was based, is shown herewith.

In February, 1905, the Ford Motor Company and 22 others formed the American Motor Car Manufacturers' Association. The object was to unite in one organization all, or nearly all, of the makers of gasoline cars who refused to admit the validity of the Selden patent.

Original Ford Car, upon Which the So-Called Selden Patent Litigation Was Based.

Previously, in 1901, the National Association of Automobile Manufacturers had been organized, the object being "the general improvement

Digitized by Google

of trade conditions and protection of trade interests." Until the formation of the A. M. C. M. A., as the so-called independent association was termed, the N. A. A. M. was associated with the Automobile Club of America in conducting automobile shows in New York City. In 1905, after the organization of the A. M. C. M. A., the N. A. A. M. announced its intention of withdrawing from the New York show field, and the A. L. A. M. secured the Madison Square Garden for this purpose. In 1906 the independents joined with the Automobile Club of America in holding a show in the recently completed 69th regiment armory. This indicates but one of the many ways in which the two associations sought to

Car Fitted with Selden's Original Motor of 1877, Which Was Demonstrated Successfully in 1907.

bring their respective products before the prospective purchasers.

Selden's Original Motor.

Subsequently the Selden vehicle illustrated herewith made its appearance in public. It was stated that the motor was the original engine built by Selden in 1877, and the entire assembly was demonstrated on the streets of New York City and on a track, making nearly eight miles an hour and negotiating grades of 8.5 per cent, with H. C. Gibson, M. E., at the wheel. This demonstration was made Sept. 7, 1907, for the purpose of convincing the court that the original Selden patent covered a practical vehicle.

The case was carried from court to court for a number of years and finally was decided adversely to the plaintiffs in January, 1911, during the progress of the A. L. A. M. show in Madison Square Garden. Shortly thereafter the A. L. A. M. was succeeded by the Automobile Board of Trade, and the A. M. C. M. A., having no further reason for existing, was disbanded. These two cars, the Ford and the Selden, reproduced herewith, undoubtedly are in many ways the most historical ever manufactured by the industry.

(To Be Continued.)

WESTGARD COMPLETES ROUTING.

Has Travelled 12,578 Miles in Official Pathfinder Car Since June 11.

The most extensive long distance pathfinding programme ever undertaken was completed when A. L. Westgard, field representative of the American Automobile Association, arrived at Los Angeles, Cal., after having traversed the continent three times since June 11 in a 40 horsepower Pathfinder car, made by the Motor Car Manufacturing Company, Indianapolis, Ind. The total mileage covered was 12,578 under all conditions of travel and the remarkable manner in which the car withstood the five months' journey is a strong testimonial of its excellent construction.

Three cross-continent routes were surveyed, the "Northwest Trail" being from New York to Seattle, Wash., through Buffalo, Chicago, St. Paul and Minneapolis, a distance of 4196 miles. The "Overland Trail," extends 3919 miles from San Francisco to New York, by way of Salt Lake City, Cheyenne, Omaha and Chicago, including a loop from Chicago to Denver, Col. The "Midland Trail," from New York to Los Angeles, Cal., is laid out through Philadelphia, Pittsburg, Indianapolis, St. Louis, Kansas City, Denver and Salt Lake City, 3547 miles being the distance covered. With the exception of 600 miles, between New York and Newburg, N. Y., and between Westfield, N. Y., and Chicago, no part of any route was covered twice and more than 8000 miles was over roads that had never been charted before.

Mexicans have taken up automobile racing quite extensively and the future of the automobile in that country appears good, judging by the interest evinced. A lively race meet took place recently at Guadalajara. The feature event was won by a Studebaker, driven by Senor J. Monte-Moussier. A big road race is scheduled for Mexico City on Christmas day.

In The Aviation Field

With the Manufacturer and Operator in America and Abroad

The Aero Club de France has decided to accept the offer of maker of the Deperdussin monoplane to loan the aerodrome de la Champagne, outside of Rheims, for the fifth annual race for the international cup, now held by Jules Vedrines, who won it at Chicago with a Deperdussin machine. The club has not selected the date, but this matter will be decided definitely at its meeting in January. Present plans seem to indicate that the flight will be held in July.

The first soldier of the Mexican army to secure an aviator's international certificate is Lieut. Horacio Ruiz, who took the test at the flying field at Hempstead Plains, Long Island, last month. He flew a Moisant monoplane, and in his cross country flight covered 50 miles in 59:00.

Brig.-Gen. James Allen, commanding the signal corps of the United States army, has ordered 50 sets of the safety harness for aviators, invented and successfully tested by W. Irving Twombly of New York City. The device was first exhibited at the international show in the Grand Central Palace, New York, last spring. It holds the pilot firmly in his place, but can be unclasped from the machine by a single motion of the hand.

The first Curtiss flying boat, as the latest type of hydraeroplane perfected by Glenn H. Curtiss is termed, has passed the tests of the United States government successfully. Francis Wildman and John D. Cooper flew the machine over Lake Keuka, in the vicinity of Hammondsport, N. Y., where the machines are made, completing the specified endurance flight of two hours at altitudes ranging from 500 to 1000 feet, in spite of the troublesome cross currents. Soon after the test it was announced that the German government has ordered a duplicate of this machine.

Word comes from France that Pierre Daucourt, flying a Borel monoplane, won the Pommery cup, offered for the longest cross country flight between sunrise and sunset. Daucourt left Valenciennes, on the Belgian border, at 5:59 in the morning, and arrived at Biarritz, almost on the Spanish border, at 5:38 in the afternoon. Military authorities, who measured the distance, found it to be about 529 miles, although it was at first stated to be 570.

H. G. Hawker, flying a Sopwith biplane, won the British Michelin competiton No. 1, for duration, which ended Oct. 31. The flight was made Oct. 24 and occupied 8:23:00. The rules of the competition provided that the machine must be of British construction throughout.

Several times during the past two years aviators have announced their intention of trying to cross the Atlantic ocean. While it is expected that this task will be accomplished in time, thus far no attempt has been made to follow the announcement with action. The latest aviator to join the list is Claude Graham-White of England, well known in this country because of his winning the second race for the international cup. He says he will use a specially designed aeroplane equipped with four engines, each of 250 horsepower.

It is interesting to note that of the 167 motors displayed at the recent Paris salon 128 were fitted with Bosch magnetos. Five were shown without ignition apparatus, and the balance of 34 was divided between five other manufacturers. Approximately 98 per cent. of the complete machines were equipped with the Bosch. This is particularly gratifying to the Bosch Magneto Company, New York City.

Digitized by Google

Von Gorrison of Germany claims a new world's record for hydraeroplanes by flying a biplane thus equipped with five passengers at Frankfurt, Nov. 8, for 23:00. The world's aeroplane record for flight with five passengers is held by Molla at 1:06:08.

Maurice Farman and Barbaroux, each with Maurice Farman biplanes and accompanied by a woman passenger, recently covered a tour of 250 miles from Buc to Etampes, France, and return.

America learns with deep regret of the death at Rheims, France, Nov. 21, of Andre Frey, one of the members of the French team which flew in the fourth race for the international cup at Chicago in September. He was undergoing military training and had shut off his engine when

Miss Agnes Firth, Cambridge, Mass., in Her Deperdussin Monoplane.

at an altitude of about 800 feet for a volplane. Suddenly one of the wings was seen to collapse and the machine tumbled to earth. No cause has been given for the accident. Frey flew an Hanroit monoplane in the Chicago race, but the make of machine utilized in the fatal flight has not been learned.

The Berlin Tagliche Rundschau announces the appearance of a new aeroplane, which it asserts can be held stationary in the air. It is equipped with two sets of motive apparatus, one a propeller to give it forward horizontal motion and the other a set of four rotary lateral planes or wings to lift it into the air. These planes are driven by three motors of 150 horsepower each, and are said to be able to lift the machine directly without any preliminary run. They are further constructed so as to expand or fold automatically. If the pilot desires to remain stationary, all he is forced to do is to stop the propeller and the rotary planes hold the machine in the same relative position. The machine is expected to prove of decided value in warfare. The body is boat shaped. It is stated that the machine is capable of a forward speed of 36 miles an hour, and can be lifted to a height of 1500 feet in three minutes.

From London comes the information that the aeroplanes attached to the allied armies in the Turkish war were of inestimable value in directing the fire against the Turks, particularly in the battle of Kirk-Kilisse and before Adrianople. In the latter instance the series of long low hills between Mustafa and Adrianople effectually cut off all view from the army, but the aviators were able to obtain full knowledge of what was transpiring throughout the entire valley and communicate it to the officers on land.

The Aero Club of America has suspended the license of Lincoln Beachey and Farnum T. Fish for flying over cities in violation of the club's rule, which holds this practise to be especially dangerous. George Mestach has been censured for his part in the collision of aeroplanes at the Chicago meet, which resulted in the death of Howard Gill, it being maintained that he did not exercise as great care as he should.

Miss Agnes Firth of Cambridge, Mass., is said to be the first woman to fly a Deperdussin monoplane. She has been studying in the Sloane Aeroplane Company's flying school at Hempstead Plains, Long Island, under the instruction of W. Leonard Bonney, and has progressed sufficiently to be entrusted with one of these machines, conceded to be the fastest monoplane now being flown. An accompanying illustration shows Miss Firth as she was about to make her first flight alone.

Burgess Co. & Curtis, Marblehead, Mass., has drawn plans for a new aeroboat which will be built absolutely rigid. It is understood that the machine has been ordered by the United States Navy, the details being left wholly to W. Starling Burgess, who is to conform as nearly as possible to the specifications given by navy officials. The lower plane is not to be as large as the upper and will be superimposed on top of the hull. This hull is to house the pilot and passengers.

A WORLD'S RECORD HYDRAEROPLANE FLIGHT.

ALTHOUGH the flight was begun as a race between an hydraeroplane and an automobile, Anthony Janus in a Benoist biplane, made by the Benoist Aeroplane Company, St. Louis, Mo., and fitted with a six-cylinder Roberts motor, has created a new world's record for cross country flight with a machine of this type. The automobile was forced to withdraw early in the race and the Benoist continued alone.

Janus started from Omaha, Neb., Oct. 7, and arrived in St. Louis, after completing 771 miles of his proposed trip to New Orleans, Oct. 18. The hydraeroplane was damaged by fire at St. Louis, Nov. 21, but Janus expected to complete the trip in another. The best previous mark for hydraeroplanes were held at 403 miles by Charles T. Weymann in a Nieuport monoplane, while Hugh Robinson in a Curtiss biplane held the American distance record at 311 miles. The following account of the trip from Omaha to St. Louis will prove of decided interest:

(By Anthony Janus.)

After accomplishing the first 771 miles of my flight from Omaha to New Orleans, by way of the Missouri and Mississippi rivers, I cannot help but think how easy the whole things appears to be now. Of course it was necessary first of all to have a machine that would do this work, and one should have enough experience in flying to be able to keep the machine up in pretty good winds. The great advantage of water flying, as compared with land flying, is in the way of safety, for one may fly in winds with a hydra that he would hardly dare to undertake with a regular land machine.

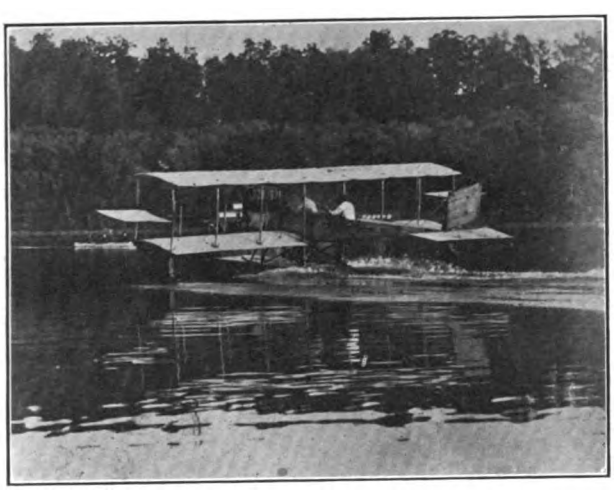
I used the standard Benoist tractor biplane, the same machine that was utilized in exhibition work during the summer of 1912 and at the Chicago meet. However, the pontoon has been rebuilt, and the method of attachment has been made to conform to the experience gained at Grant park. Besides I had had weeks of practise at Grove Couer lake and on the Mississippi river, and all of this was applied to the redesigning of the pontoon, which is five feet wide, 12 feet long and 14 inches deep at the step. Its displacement is about 2000 pounds, so that there never was any danger of sinking, no matter how heavy the load I had on the machine. This is a detail that must be watched closely in designing planes for water work, for if the motor stops and the tail touches the surface of the water when the machine is headed down stream it will go deeper and deeper, with the result that the whole assembly will be tipped up backwards.

My machine will carry 1750 pounds, but I seldom load it to more than 1650. When I carry a passenger I use a 20-gallon gasoline tank. When I am alone I carry 50 gallons of gasoline, which with my own weight of 170 pounds, a very heavy suitcase and kit of tools, and an extra two gallons of lubricating oil, runs the weight on the machine up to nearly 1600 pounds. However, I have been able to climb 2000 feet in 10 minutes with this load.

The Benoist type XII tractor is constructed so that it can be used either with a 25 or 35-foot spread. Often in regular exhibition work I would cut this down to 25 feet, as it added a little bit

Anthony Janus in His Benoist Hydraeroplane on World's Record Flight Between St. Joseph and Kansas City.

to the speed and helped out in very windy weather. But I find it unnecessary to cut it down for water work, as I simply fly near the water when conditions are bad, with the result that I can make about 62 miles an hour, and feel just as safe as I would in an automobile at 25 on a good road.



I left Omaha at 3:30 in the afternoon and landed at Nebraska City, 90 miles down the river, at 5, averaging exactly 60 miles an hour for the 1.5 hours I was out. While the wind blew very strong this first afternoon and from one side all the time, still it did not seem gusty. It was necessary to watch the plane closely, but I felt no more fatigue at the end of this hour and a half than I would have felt running an automobile for that length of time over the usual country road.

I flew much higher that day than I have since, as I had become so in the habit of flying

Digitized by Google

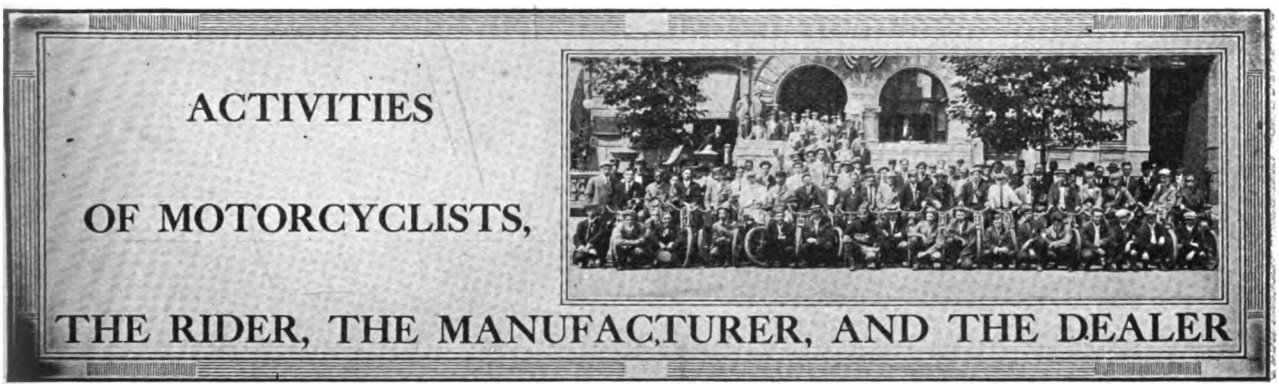
exhibitions that I naturally would begin to climb the minute I got off the water. By the time I reached St. Louis I found that my plane had much better lift near the water, and that I did not have to bother so much about my equipment. Also the flying was not nearly so monotonous. One is able to realize the speed he is making, as well as see the different objects, such as hills, bluffs, fields and towns, as he goes along—and see them naturally.

On the second day out I had more trouble than any day before or since. This was directly traceable to inexperience. I left Nebraska City in the afternoon, expecting to make Forest City, Mo., 85 miles away, and had sent my mechanics on with the tools and lubricating oil to meet me there. They did not find out, until they reached Forest City, that it was five miles from the river. After flying about an hour, I decided to clean my

Janus and His Benoist Hydraeroplane Alighting on the River Preparatory to Stopping at Boonville, Mo., for the Night.

spark plugs, so ran the machine on the edge of a little sand bank and stopped the engine. When the plugs were cleaned and adjusted I started the engine again, only to find that the sand had piled around the pontoon so that I could not pull it out with the power I had. I was compelled to get my feet wet, by getting out and pushing the machine into the water. However, a great amount of trouble was eliminated, because of the fact that the operator of a Benoist can start his own motor without help. Later I found that when I needed to make adjustments all I had to do was to head the machine up stream, stop the motor, and let the outfit drift. After attending to what was wrong I started the motor by standing on the pontoon back of the propeller, then got back into the machine and resumed my course.

I found the people all along the route willing to help as much as possible. Probably one reason was because we furnished a real holiday in every town in which we stopped. In the town of White Cloud, Neb., where I stopped for oil and gasoline on the way to St. Joseph, Mo., the school ma'am dismissed school for half a day, and the old gentleman who ran the bank there did not open in the morning until after I had gone.



I reached St. Joseph the evening of the second day out of Omaha, and the next morning, bright and early, I started for Kansas City, 130 miles away. I had gasoline for about two hours, and anticipated no trouble in reaching that city before it gave out. I struck a hard wind before I had gone 10 minutes, and tried several different altitudes before deciding it was no worse near the water than elsewhere. From the different land marks I saw I was only making about 50 miles an hour, although I was running at top speed all the time. As a result I was forced to land at Parkville, a small town on the Missouri side, just 10 miles from Kansas City.

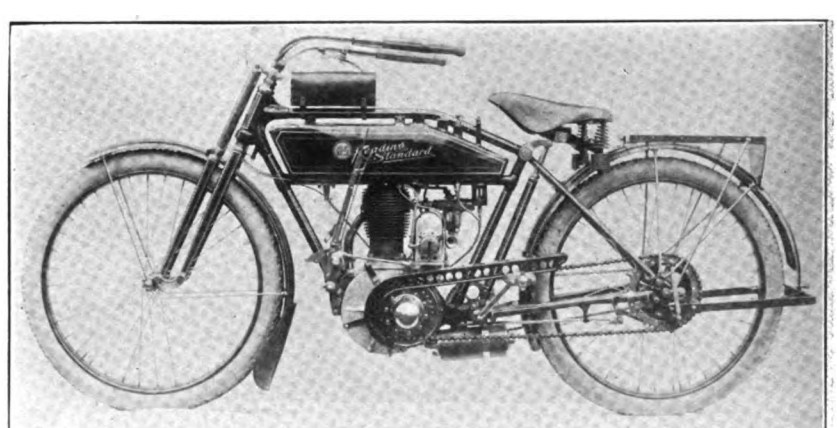
I telephoned to T. W. Benoist and Horace Kearny, who were in that city, and they brought me some lubricating oil by automobile. I got some gasoline in town, and flew down to Kansas City, landing just above the bridge, opposite the foot of Mulberry street. It was the first good landing place I had found since leaving Omaha. The distance from Omaha to Kansas City was 320 miles, and my flying time was 5:50:00.

After leaving this point the trip became much easier. One reason was because there was plenty of water to fly over, and the sand bars were not so bad when making landings. Of course the experience I had gotten helped some, so I had no trouble in making any place I started out for on schedule time. I gave exhibitions in Waverly, Boonville, Glasgow, Jefferson City, St. Charles and Alton, and arrived in St. Louis about 5 Sunday afternoon. Nearly 50,000 people had assembled on the levee to give me welcome.

My complete flying time for the 771 miles was 15 hours. I was out only nine days, made 13 exhibitions, stopped a day in three places and three at Kansas City, so that if time were any consideration one could use an hydraeroplane to much better advantage than an automobile in travelling from place to place. According to the government surveys there are about 25,000 miles of rivers in the Mississippi valley that could be traversed by a good hydraeroplane, which, leaving aside the commercial possibilities, opens up a wide field for pleasure flying and touring.

Digitized by Google

Three R-S Models for 1913.



The Reading-Standard Company, Reading, Penn., announces three R-S models for the 1913 season, one of which has option of chain or belt drive. Naturally, the leader is the 7-8 horsepower twin, chain driven. The Tourist is a single with a motor rated at five horsepower, and this offers the option referred to above. The third model is a belt driven single, known as the Service, rated at four horsepower.

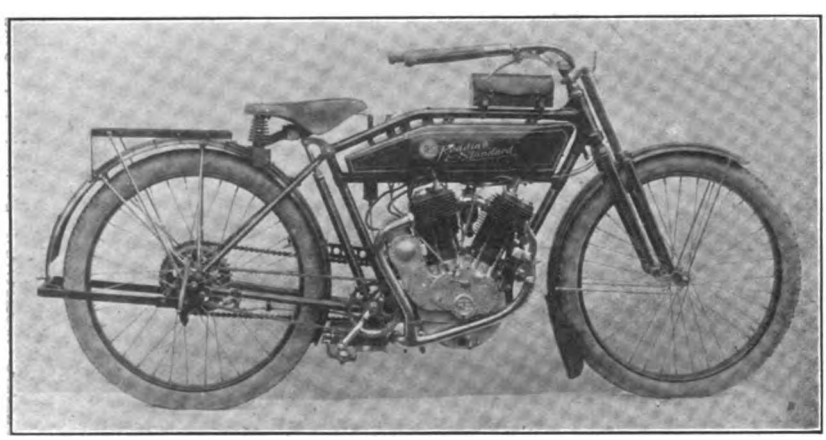
Increased factory facilities, standardization of parts and improvements in manufacturing all make for more economical production, it is maintained, and in consequence the prices have been reduced. The company will manufacture motorcycles exclusively during the coming season.

The most radical change is to be found in the motor on the Tourist, which follows the design of the twin in all its details. Other features will be revealed in a description of the mounts, and since the twin is the leader, it will prove advisable to consider that first.

The motor is of the long stroke type with mechanically operated valves. The valve gear is identical in all R-S mounts. The intake and exhaust cams and the operating gear wheel are made of a single piece of vanadium steel. The gear wheel is of liberal size and substantial cams are milled on each side of it in the proper position, absolutely preventing the possibility of shifting cams or of error in assembling. The cams are undercut around the centres, providing unusually long and substantial shafts and bearings without increasing the depth of the gearcase. Single lift levers transmit the movement from the cams to the valve lift rods, which also are of vanadium steel screwed into the base, and of burnt gases and to prevent any tendency to are provided with felt washers to absorb oil and to prevent leakage.

The cylinders have been redesigned, this applying to the compression space and valve pockets, the object being to secure perfect clearance of burnt gases and to prevent any tendency to overheat. The crankcase compression release, formerly located on the rear of the camcase directly under the magneto, has been changed by releasing the compression through a boss cast integral into which is screwed a specially designed ball check to prevent the loss of oil.

Left Side of the R-S 1913 Tourist Model for Coming Season.



Ignition is by an armored type Bosch magneto, clamped down on the base at the rear of the motor, as in former R-S practise. The carburetor is the latest improved Schebler, with automatic float feed. Control is by R-S patented double system, operated by genuine imported Bowden wire entirely enclosed and decidedly efficient. The compression release on the right grip controls the carburetor and the left the magneto advance.

The clutch has been redesigned, although it is

Digitized by Google

of the cone type, the same as on the 1912 twin. Cork inserts have been added, an arrangement that is held to give better grip, smoother engagement and to increase the efficiency by at least 50 per cent. Two point ball bearings have been substituted for the radial bearings previously used, permitting easy adjustment to take up wear. The clutch spring and operating jaws have been strengthened very materially by larger thrust bearings, and double the amount of bearing has been given the clutch shaft by increasing the thickness of the clutch plate and lengthening the bronze bushing on the front cone.

Brakes always have been made a subject of special attention on R-S models. The twin and the Tourist chain driven mounts are equipped with two sets—one a Corbin V band brake of the usual back pedal type, the other a powerful flat band working on a substantial drum placed on the redesigned and strengthened rear hub. On the Tourist belt machine the second brake is a powerful foot operated member on the rear belt rim.

Right Side of the R-S Twin, Chain Driven Model for 1913.

The new rear motor and eccentric bracket are integral with larger throw to adjust the chain. This eccentric is clamped on each end, doing away with the set screw and thus preventing the possibility of turning. It is very accessible and is simple and easy to adjust. Two oil cups afford proper lubrication to the starting crank.

The gasoline capacity of the twin and Tourist models has been increased to 2.5 gallons. The combination tank is extra strong and fitted with strainers. The oil capacity is three quarts. On the Service model the tank holds two gallons of fuel and two quarts of lubricant.

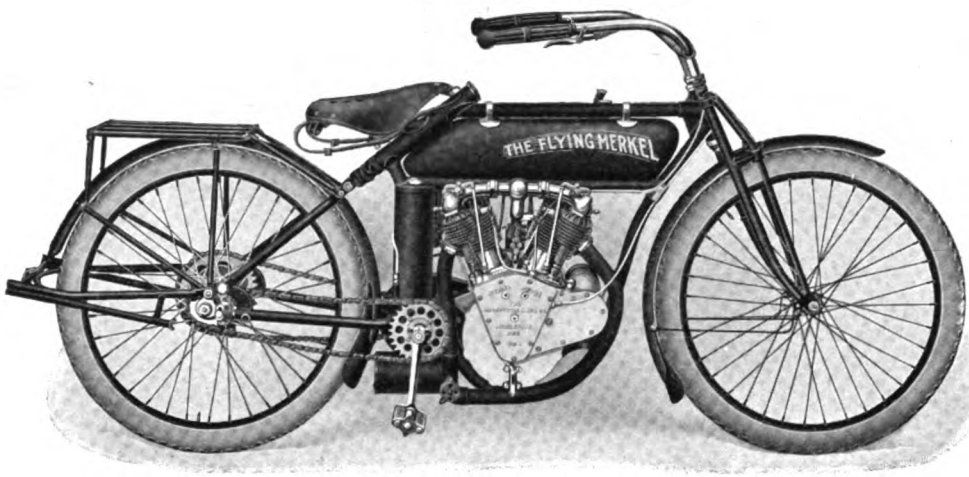
The front forks are of the vertical acting spring cushion type on all models. The latest R-S adjustable shock absorbing cushion seat post also is standard equipment. The frame is of special tubing, reinforced throughout, and is of the camel back design. On the Tourist and twin both front and rear forks are widened for the use of larger tires if desired, and adjustable footrests make for additional comfort.

Wheels are 28 inches, with strong steel rims. Goodyear 28 by 2.5-inch tires are standard. The saddle is a Troxel. Other equipment includes automatic stand with clip, luggage carrier and leather tool box. The last named is fitted with a neat lock and is placed on the top bar of the frame.

Planning Motorcycle Classic.

The officials of the Chicago Motorcycle Club have started a movement to create in this country a motorcycle classic similar to the Tourist Trophy race of British motorcyclists and it is proposed to hold the event July 4, 1913. This leaves seven months of preparation and there seems to be no valid reason why the contest should not materialize. It is planned to hold the event each year over the same course and to have it open to all who desire to enter. The proposed course is the speedway at Elgin, Ill., 30 miles from Chicago, which is 8.33 miles long and 100 riders could easily compete at once. Three races would be held in one, to accommodate the twins, five horsepower machines and four horsepower singles. The big machines will be required to travel 250 miles, while the distance for the five horsepower machines will be 200 miles and for the fours 175 miles. Nothing but strictly stock machines will be allowed to start. Large trophies emblematic of the occasion will be awarded and the race will be held under the F. A. M. rules.

Hendee Will Protect Patents.



The Hendee Manufacturing Company, Springfield, Mass., maker of Indian motorcycles, has issued a warning to the motorcycle trade that patents have been applied for on the new cradle spring fork. The patent attorneys of the concern have also given notice that patents are pending on this fork and that infringement will meet with vigorous prosecution.

Earl in New Position.

SPEED

THE MOST POWERFUL TWIN MADE

Since our 1913 announcement appeared one week ago we have received two or three sacks of mail every day—all inquiries from persons who want to know more about

THE FLYING MERKEL

The Only Self-Starting Two-Speed Motorcycle in the World

The 1913 Flying Merkel embodies every feature that could be desired in a motorcycle, and many exclusive features hitherto believed impossible to apply to a two-wheeled vehicle. The wonderful Self-Starter, Two-Speed Free Engine Hub, Hess-Bright full Ball-Bearing Motor, the Original and **Only** successful Spring Frame, low saddle position, Mechanical Valves and many other features.

Exhaustive tests have proved the 1913 Flying Merkel the most powerful motor made. The twin has climbed hills that no other motorcycle ever before has conquered, while the single can romp up tortuous grades that some big twins have difficulty in surmounting.

The 1913 Flying Merkel universally has been acclaimed the sensation of the motorcycle world. Ask the most successful dealer in your town—he represents the Flying Merkel, or write direct to us for 1913 advance catalog.

Conn., maker of Corbin brakes and hubs, has been elected president of the Universal Machine Screw Company of Hartford, Conn., this company having recently been acquired by the American Hardware Corporation, which also owns the Corbin Screw Corporation and numerous similar plants. The Universal Screw Machine Company will be operated as an independent institution.

Fred T. Kerr, Ontario Emblem Rider, Making Miles on Dirt Track in 1:16.

Likes His Harley-Davidson.

This is the first year that Gordon Koerner of Providence, R. I., has been riding, but he declares it will not be his last. Early in the season he selected the Harley-Davidson, and purchased the machine shown in an accompanying illustration through J. Clarence Loftis of the Elmwood Cyclery in that city, agent for the maker, the Harley-Davidson Motor Company, Milwaukee, Wis. He has been the chief fun maker in the crowd in all the weekly runs, and says that not a little of his good nature is due to the satisfactory results obtained from his mount.

Club Notes Here and There.

A series of smokers will be conducted during the winter by the Akron Motorcycle Club, Akron, O., making it an object for new members to join and to further the interests of the present members.

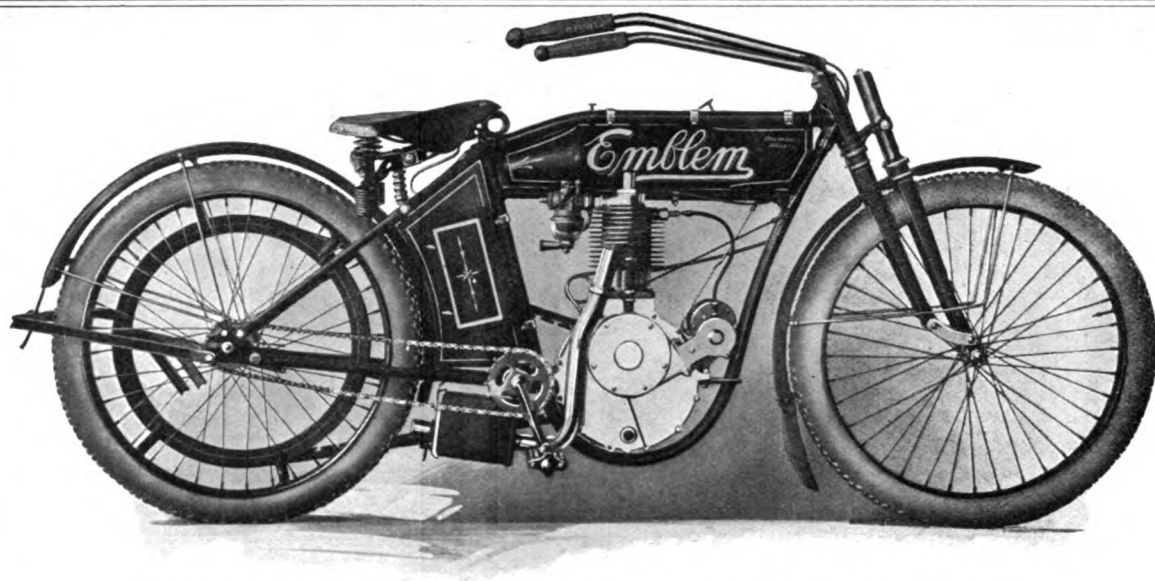
The Invincible Motorcycle Club, Brooklyn, N. Y., has instructed its entertainment committee to make arrangements for a winter programme. Officers have been elected for the coming year as follows: President, M. M. Aiken; vice president, L. N. Vine; recording secretary, C. J. Washburn; treasurer, D. R. Thompson; captain, J. C. Fawcett; board of governors, R. F. Graves, H. E. Stout, J. B. French, F. H. Chase, O. P. Warlick.

The touring season of the Providence Motorcycle Club, Providence, R. I., for 1913 will start April 28, when the annual Herring run will be held to Taunton, Mass.

The National Capitol Motorcycle Club, Washington, D. C., is seeking to hold its winter membership and to that end meetings are held every week, business and entertainment alternating every other week. The entertainments are varied each time so that they never fail to evince interest and attract the members to the clubrooms.

About 40 motorcycle enthusiasts recently met at Motorcycle Exchange, Pittsburg, Penn., and effected the reorganization of the Pittsburg Motorcycle Club. Various social events will be conducted during the winter and next season the club will feature races, club runs and tours. At the organization meeting Samuel J. Martin was elected president. John Ward was chosen vice president and R. J. Black will act as secretary.

The Jamestown Motorcycle Club, Jamestown, N. Y., with a charter membership of 25, was recently organized with the following officers: President, Verne Squier; vice president, Lawrence Lovejoy; secretary, Bertil Johnson; treasurer, Merle Barton. Several committees were chosen and the colors of the club were decided to be orange and black.



The Chicago Motorcycle Club, Chicago, recently elected its officers for the coming year. Three tickets were in the field and balloting was by the Australian system. The results follow:

Gordon Koerner, Providence, R. I., and His Harley-Davidson Mount.

President, R. T. Purdy; vice president, Capt. F. E. Yates; treasurer, A. Willen; secretary, D. Hall; road captain, William S. Covington; first

ANGOLA ERIE COUNTY NEW YORK

lieutenant, Edward Schaddie; second lieutenant, Frank Nelson; sergeant-at-arms, Oscar Persons; contest committee, R. R. Hill, F. I. Huyck, C. H. Lang, J. R. Purdy and T. Monroe; board of directors, R. R. Hill and Marcus Golder.

The Rockford Motorcycle Club, Rockford, Ill., recently opened its new clubrooms with an entertainment, followed by a banquet. Among the guests were John Cameron of the Goodyear Tire & Rubber Company, who gave an interesting talk on tires; William Olson of the Excelsior Cycle Company, and D. R. Hix of Chicago. A loving cup was presented to President Fred Sullivan for his hard and conscientious work during the past year.

The Maryland Motorcycle Club, Baltimore, Md., recently enjoyed a run to a nearby shore, where an oyster roast was enjoyed. Nelson Johnson of the club is practically assured of the diamond medal for the attendance record, as he is so far in the lead it will be impossible to overtake him, especially as only short runs with one point scores are scheduled the rest of the year.

Emblem Agency Expanding.

Ballou & Wright, for many years engaged in the bicycle and motorcycle business at Portland, Ore., will soon open a branch at Seattle, Wash., in the new building being erected at 817 East Pike street. A. H. Jones, who has been branch manager for the United States Tire Company since that company entered Seattle, will be manager of the Ballou & Wright branch. In addition to its extensive supply business, the firm is distributor for the Emblem and Indian motorcycles in the states of Oregon, Idaho and Washington.

Dayton Twin Makes Initial Bow.

An absolutely new motorcycle, which makes its initial appearance for the 1913 season, is the

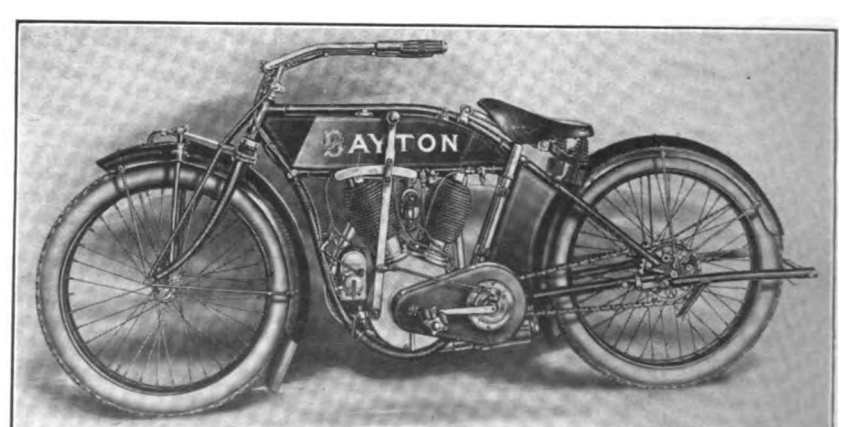
Right Side of Dayton DeLuxe Twin, Produced by Davis Sewing Machine Company, Dayton, O.

Dayton twin, produced by the Davis Sewing Machine Company, Dayton, O. The concern is well known in its former field, having a record of 50 years in the production of superior sewing machines, a shop equipment always maintained in an up-to-date manner, and a modern and complete factory organization. This should be sufficient assurance that the new motorcycle will be fully in keeping with the demands of the riders. The production for the initial season has been fixed at 4000 mounts, and these will be made in twin models only, one of seven horsepower and the other of nine. Transmission is by chain with both.

It is maintained by the maker that there is nothing revolutionary or radical in the design of the Dayton, but rather there is refinement and improvement throughout. All really good features of established motorcycle construction have been retained, and an effort has been made to include additional features which a thorough study of riding conditions has shown the rider actually needs.



The Dayton is designed for power and is said to possess it. It is stated that the seven horsepower motor has developed more than 11, while the nine has indicated the possibility of over 13. The result is ample power for all emergencies. It is pointed out that the Dayton motor delivers sufficient energy at low speed to enable the rider to make any hill without racing, and that there is no danger of stalling in sand or mud.

The seven horsepower unit has bore of 3.25 inches and stroke of 3.67, giving a piston displacement of 60.92, while the nine has bore of 3.5 and stroke of 3.67, the displacement being 70.62. The crankcase is in one piece with a cover, making for a rigid and oil tight construction. The crankshaft also is in one piece, affording strength, rigidity, quietness and long life of bearings. The latter are large annular ball bearings with improved retainers in steel pockets.

The lower ends of the connecting rods are equipped with extra large roller anti-friction crankpin bearings. The load and thrust are evenly distributed over the whole length of these rollers, which are held to present a large amount of projected area. Wear can be adjusted by merely advancing the cone very slightly into the cup or cage, and the connecting rods themselves are provided with take-up nuts for the adjustment of these bearings.

A one-piece camshaft with integral cams for all four valves also makes for quiet running, and the gears which drive this shaft and the magneto are of the spiral type, made from alloy steel scientifically hardened. The camshaft bearings are of exceptional length, reducing wear to a minimum.

The intake and exhaust valves are of nickel steel and of liberal dimensions. In addition, a cast iron seat is electrically welded to the rim section of the exhaust valves, which are directly below the intake members, and both are mechanically operated. The intake mechanism is simple and strong, and the rocker arm is completely enclosed in an oil bath, which assists in securing

Left Side of Dayton DeLuxe Model, Designed for Power and Said to Possess It.

Digitized by Google

quietness in operation. The cylinders may be primed readily by removing a screw with a knurled extension head, on either side of the intake manifold domes.

The double lubrication system comprises a sight feed drip and force feed pump internally contained in the tank. Each drop of oil is caused to pass through the crankpin bearing, and by means of a connection between the cam gear chamber and the flywheel catch ring, all surplus lubricant passes into the crankcase through this bearing. An improved oil sight window is provided in the lower part of the crankcase.

Ignition is by the latest type of armored Bosch magneto, with absolute protection against dust, water or mud. The carburetor is a model H Schebler with one-inch intake. Control is by double grip, designed especially for long wear and extra strength. The gasoline capacity is 2.5 gallons, with a reserve compartment holding one pint. That of the oil tank is two quarts. The combination fuel and oil container is constructed of the best 22-ounce cold rolled copper, and the reserve compartment is at the extreme forward end, the emergency supply being run back into the main tank by raising the front of the machine.

The front fork is of the spring suspension type, and the seat post is equipped with the Dayton shock absorbing spring, making for easy riding qualities. The drop forged seat post cluster forms a part of the frame, which is made of extra large heavy gauge tubing, reinforced with D tubing. The guards are extra strong, deep and wide, and the tire equipment is 28 by three inches, United States tires being fitted as regular, with an option of Diamond or Goodyear. The wheels are of the 28-inch C C type, with extra heavy rim. The front members have 36 spokes and the rear 40. The wheelbase is 57 inches.

A Troxel No. 1 saddle is fitted regularly, but option of a Persons is permitted. An exclusive feature is the use of the Lester motorcycle coast brake, and the Eclipse free engine clutch is another prominent attachment. When desired the engine may be stopped by means of a magneto cut-out and the compression of the motor may be utilized as an auxiliary brake, adding still another factor of safety.

Track Record Reduced.

At the third annual race meet of the Lancaster Motorcycle Club at Lancaster, Penn., Harry C. Becker of Reading, Penn., mounted on a Flying Merkel single, reduced the track record from 1:16 to 1:09, defeating all other machines entered, some of which were special racing machines. The former record was made three years ago, and although numerous attempts have been made to lower it no one was successful until Mr. Becker's performance. His time is considered a record for half-mile tracks.

Attractive Show Window Display Made by Stebbins & Geynet, Merkel Agent in Norwich, Conn.

Devotes Full Time to Motorcycle.

Peter O'Horo has sold his interests in the Ero Manufacturing Company, Chicago, maker of popular specialties, to the other members of the company and will in future devote his time to the affairs of the Excelsior Cycle Company, Chicago, maker of De Luxe motorcycles. The business of both concerns had grown to such an extent that it proved impractical to devote partial time to each, so Mr. O'Horo decided to retain his interest in the Excelsior company.

INDIAN RIDERS

Cold weather is here. Motor turns over hard. Very hard work to get started. A little kerosene or gasoline injected into cylinder head will remedy this at once. A priming cup is needed in top of cylinder head as it takes too much time to take out spark plug each time. Indian riders, send at once for a finely made and finished priming cup to fit top of cylinder head of your Indian. Price, postpaid, $1 each. Money refunded if you are not satisfied.

B. A. SWENSON 298 Blackstone St., Cor. Prairie Ave., Providence, R.I.

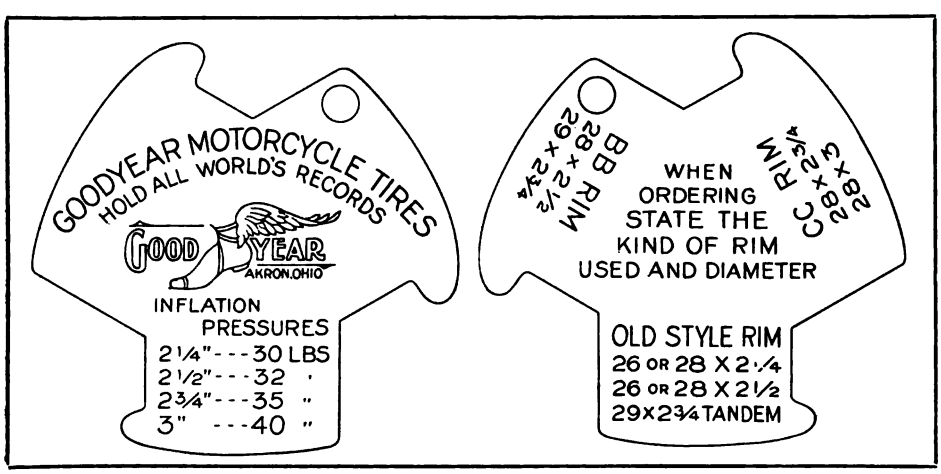
F. A. M. Registration.

The membership of the F. A. M. continues to grow and the report for November shows that there were 330 new members registered. These were recorded in the numerous states as follows: California, 41; Ohio, 40; Illinois, 36; Kansas, 34; New York, 28; Missouri, 27; Indiana, 24; Louisiana, 19; New Jersey, 16; Wisconsin, 16; Texas, eight; Pennsylvania; seven; Montana, five; Washington, five; Philippine Islands, four; Kentucky, four; Florida, three; Massachusetts, three; Michigan, two. Those having one each were Nevada, South Dakeota, North Dakota, Minnesota, Georgia, Connecticut, Cuba, Arizona, Colorado.

Must Build Motordrome Protections.



Chairman Thornley of the competition committee of the F. A. M. has represented to the management of the motordromes at San Francisco and Los Angeles, Cal., that without delay they must put up overhanging protection for the public in order that the races may be conducted safely and no further sanctions for meets will be granted until the instructions are followed out. According to the letter sent by the chairman, the overhanging protection must be a perpendicular boarding of at least 30 inches from the top of the incline. From the top of this must be a strong netting overhanging the track about 30 degrees, the width of this portion being at least two feet. These precautions are the most effective in operation at the present time and they will afford a guarantee of safety from accidents to the public attending race meets.

Progress of Touring Bureau.

The attention of F. A. M. members has been called to the progress attained in the newly established touring bureau, 51 Chambers street, New York City. The bureau is gradually being equipped to answer satisfactorily any inquiry regarding touring from any F. A. M. member in good standing. Secretary-Treasurer Gibson receives many inquiries for touring information, but these requests are all referred to the touring department. Mr. Donahue is slowly obtaining the best road maps of all sections of the United States from three of the best map specialists of the country. There are also being compiled accurate data regarding foreign touring and F. A. M. members intending to go abroad will receive on request excellent information regarding conditions where he intends to tour and advice as to crating his machine, shipping requirements, customs and license regulations governing countries he intends to tour.

New Goodyear Rim Gauge.

The Goodyear Tire & Rubber Company, Akron, O., through S. A. Falor of the motorcycle tire department, is supplying the trade with a new rim gauge upon application. With this gauge, which is shown in reduced form in an accompanying illustration, the dealer can tell in a moment the most suitably sized tire for any given rim. All that is necessary is to insert into the rim the correct gauge length, note the one that fits and read on the proper section of the gauge the exact size to be used. The tire size is printed boldly on the section fitting the rim, and a glance is all that is required.

Rim Gauge for Motorcycle Tires Produced by Goodyear Tire & Rubber Company.

About three years ago a 2.25-inch motorcycle tire was the vogue. Then came the increased tire size to 2.5 inches, but with the same rim. And it was still used with the 2.75 and three-inch tires. The result was that the large tires overlapped and bore over on both sides of the rim. Larger tires were needed with harder and faster riding, and the rims have now been standardized as the "Old Style," "B B" and "C C."

The new rim gauge simplifies the whole matter and ends all confusion. Mr. Falor declares that it is notable that the device was thought out in the Goodyear factory, as it shows the Goodyear spirit—a spirit of willingness which extends throughout the entire organization.

The following concerns have been recently incorporated to deal in motor cars, accessories, etc.:

Miller-Brisben Company, Inc., New York City; $25,000; automobiles; incorporators, John McNeill Brisben, Irving Jaffe, Warren A. Miller.

Stegeman Motor Truck Company of New York, Inc., New York City; $25,000; incorporators, John A. Kent, James C. Smith, John G. Anderson.

S. & M. Company, Taunton, Mass.; $5000; garage; incorporators, Frederick A. Shaw, Chester H. Morse, Rachel Morse.

Stutz Motor Car Company of New Haven, New Haven, Conn.; $10,000; incorporators, John P. H. Chandler, Edward J. Bartlett, Dana B. Jefferson.

A. W. Cox & Co., Inc., Boston; $10,000; operating and maintaining garages; incorporators, N. B. Todd, Charles B. Baldwin, A. W. Cox.

Elgin Motor Company, Elgin, Ill.; $20,000; to manufacture motors; incorporators, Edward J. O'Beirne, E. G. Adamek, Charles G. Adamek.

Torkington Tire Company of America, Wilmington, Del.; $1,300,000; incorporators, I. Fogg, G. D. Hopkins, G. W. Dillman.

Niagara Motors & Manufacturing Company, Dunkirk, N. Y.; $275,000; to manufacture motors and parts; incorporators, Edward J. West, Morris M. Hedden, Daniel W. Frey.

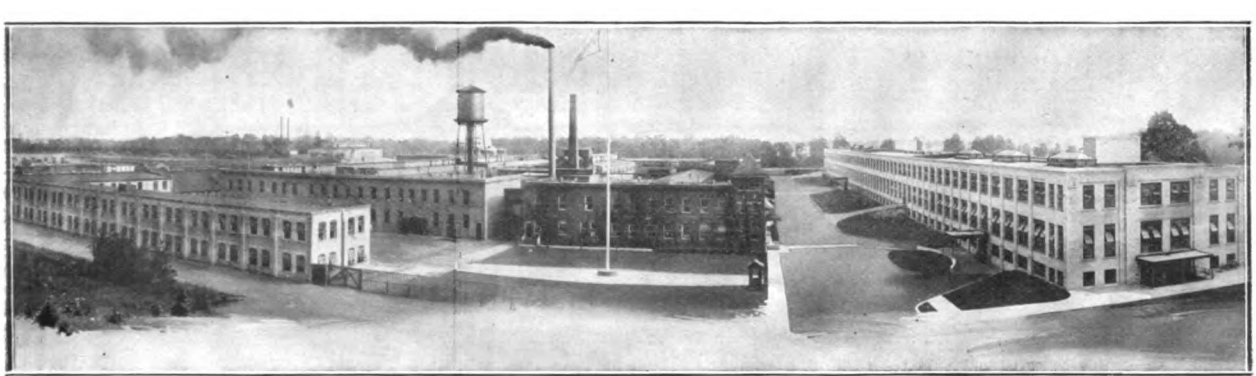
Chandler Engine Valve Company, Chicago; $60,000; incorporators, G. A. Critton, N. B. Dearborn, E. S. Hoskin.

Knight Motor Car Company, San Antonio, Tex.; $10,000; to deal in motor cars; incorporators, H. L. Knight, A. H. Danforth, A. H. Elmore.

Anderson Electric Car Company, Boston; $10,000; to deal in motor cars; incorporators, Albert Weatherby, Frank R. Keith, Alonzo E. Yont.

WITH THE MANUFACTURERS.

The Ultra Motor Car Company, Amesbury, Mass., which is making a new medium priced car, has moved its factory equipment to Taunton, Mass., where it will occupy part of the building in which is located the recently formed Interchangeable Rubber Heel Company, which is manufacturing a new tire, guaranteed for 10,000 miles.



A. Gale Thompson, for 16 years a salesman for the products of the Joseph Dixon Crucible Company, Jersey City, N. J., has been appointed sales manager of the automobile department of the firm, with headquarters at 68 Reade street, New York City.

Henry A. Wagner, formerly with the Buick and Abbott companies, is now connected with the service department of the Garford Company, Elyria, O., maker of Garford pleasure cars and trucks.

The Buffalo Electric Vehicle Company, Buffalo, N. Y., maker of Buffalo electrics, is to manufacture a line of trucks from 1000 pounds to two tons capacity. The company recently acquired the interests of the Babcock Electric Carriage Company and the Clark Motor Company, with all patent rights.

The Empire Automobile Company, Indianapolis, Ind., announces the appointment of the following dealers and distributors for the Empire five-passenger touring car: John F. Orr, Carmi, Ill.; Commercial Motor Sales Company, Cincinnati, O.; Cartercar Iowa Company, Des Moines, Ia.; Ellis Car Company, Greenville, S. C.; H. F. Wagner, Greentown, Ind.; England Bros. Motor Company, Kansas City, Mo.; Greer Robbins Company, Los Angeles, Cal.; McDonald Automobile Company, Memphis, Tenn.; Johnson Automobile Company, St. Louis, Mo.; C. F. Brown Automobile Company, Shreveport, La.; Crist Motor Sales Company, Toledo, O.; Peru Can Zandy Implement Company, Wichita, Kan.; C. J. Reeve, Cleveland, O.; Sherman Bradley, Corning, Ia.; Somerset Automobile Company, Somerset, Penn.; Cumberland Valley Garage, Carlisle, Penn.; Galion Motor Car Company, Galion, O.; Haines Bros., Quincy, O.; W. S. Woodring, LeCarne, O.; Columbus Automobile Company, Columbus, Neb.; W. H. May, Pompton Plains, N. J.; R. W. Taylor, Mokane, Mo.; Silas Lieb, Pender, Neb.; Schoepp & Karch, Mascoutah, Ill.; W. G. Hunt, Brighton, Ill.

The Kissel Motor Car Company, Hartford, Wis., maker of KisselKar pleasure cars and trucks, has established a large service station at 1030 Commonwealth avenue, Boston, with Manager Pruden of the New England branch in charge. The building is of reinforced concrete and is two stories high. The second floor is used for the truck department, the pleasure car salesrooms being on the ground floor. A large turntable is provided for the handling of the large trucks. The rear of the second floor has the repair shop, which is thoroughly

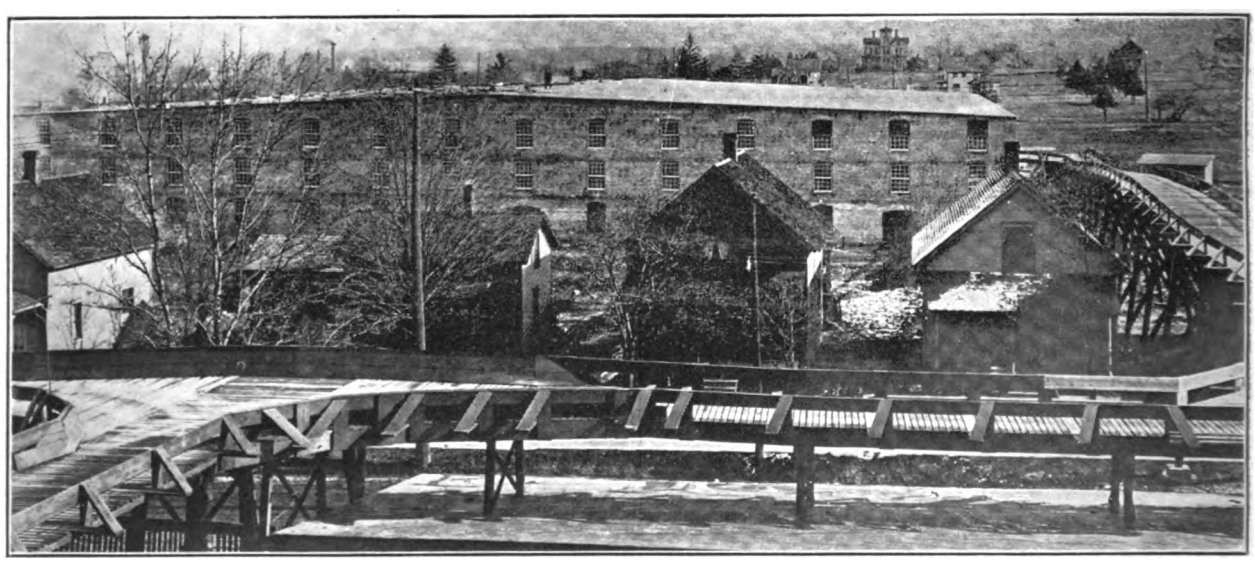
Bird's-Eye View of the Olds Motor Works Plant in Lansing, Mich., Where Oldsmobile Cars Are Produced.

Digitized by Google

equipped, including electrical machines of all modern kinds to facilitate the repair of pleasure and commercial vehicles.

Gerald Fitzgerald, who has for some time been assistant manager of the Chicago branch of the Remy Electric Company, will assume the position of manager of the factory branch to be opened at Minneapolis, Minn. M. C. Kent, also of the Chicago forces, will be assistant manager.

Cyril J. Atkinson, M. E., inventor and patentee of the Atkinson gas producer and a number of special devices pertaining to gas producers, has severed his connection with the Dornfield-Kunert Company of Watertown, Wis. Mr. Atkinson's services and the use of all his patents have been secured by Fairbanks, Morse & Co., Chicago, maker of all kinds of motors, and a number of Mr. Atkinson's valuable patents will be incorporated in the Fairbanks-Morse gas producers at once.



W. Krafve has joined the sales force of the H. J. Koehler Sporting Goods Company, New York City, distributor of the Koehler commercial car. Mr. Krafve for a number of years handled the Cadillac and Buick cars in New England territory and his friends will, no doubt, be interested in learning of his new connection.

The Reo Motor Car Company, Lansing, Mich., maker of Reo cars, has recently completed its new three-story shipping and assembly plant, 252 by 252 feet, providing his long agency experience, was particularly valuable in the special character of work that he did for the General Motors Company.

J. B. Maus, formerly district manager of the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, and William Ellenbeck, Jr., manager of the Brooklyn branch of the same company, who recently resigned, are now associated with the main office of the United States Tire Company, Broadway and 58th street, New York City.

H. G. Salisbury, general manager of the California territory of the Motor Car Manufacturing Company, Indianapolis, Ind., maker of the Pathfinder 40, has announced the appointment of Barry Cool, a well known automobile man of Los Angeles, Cal., as manager of the northern branch.

The Henderson Motor Car Company, Indianapolis, Ind., has appointed the following new agents for Henderson cars: American Motor Sales Company, Toronto, Can.; The Henderson Motor Sales Company, Baltimore, Md.; Howard D. Graves, Hartford, Conn.; Knowles & Collins, New Haven, Conn.; George O. Franklin, Pulaski, Fla.; F. D. Aiken's Sons, Brunswick, Ga.; Cummins Motor Car Company, Harrisburg, Ill.; Ajax Motor Sales Company, Springfield, Ill.; J. I. Johnson, Palmer, Ia.; James N. Kemp Machine Works, Albany, N. Y.; Earl Knickerbocker, Binghamton, N. Y.; H. L. Mann, Portland, Ore.; G. C. Brenner, Mechanicsburg, Penn.; T. H. Sutherland, Washington, Penn.; J. B. Higginson, Providence, R. I.

New Three-Story Shipping and Assembly Plant of Reo Motor Car Company, Lansing, Mich., and Runway Connecting It with Main Factory.

190,512 additional square feet of floor space with a capacity of 1600 cars. The floors are of cement, and the structure is fitted throughout with an effective automatic sprinkling system. A feature in connection with this plant is the special overhead runway leading to the main factory.

H. L. Shepler, general superintendent of the Willys-Overland industries, of Toledo, O., has gone to Europe for two months, during which time he will pay particular attention to the foreign motor car industry, especially as related to the question of proposed production of high-grade cars at low prices which is being agitated in England and Germany at present.

The Globe Seamless Tube Company is seeking a location for a factory in Detroit. The plant when in operation will give employment to a large number of men.

F. W. Kurtz, who has just completed his work with the General Motors Company, Detroit, having been the director of advertising since May, 1911, and having perfected an organization whereby each subsidiary company now has its own efficient advertising department, has returned to Philadelphia, where he has resumed his connection with the well known advertising firm of N. W. Ayer & Son, with which house he had been associated for 12 years previous to his removal to Detroit. Mr. Kurtz's knowledge of advertising, acquired through

The Nicholds Company, Detroit, heretofore engaged in the manufacture of automobile parts, has taken up, in addition, the production of automobile chassis for the trade.

Smalley Daniels, formerly of Boston and now with headquarters in Detroit, who has specialized in metal boxes among other automobile equipment, has become financially interested in a new box factory at Cleveland, O., under the style of G. F. Mitchell & Son., and will act as sales manager. The concern also will produce a line of funnels, measures, mufflers and drip pans.

GARAGE AND DEALER.

The Electric Manufacturing Company, 353-355 Minnesota street, St. Paul, Minn., of which L. J. Shields is manager, has secured the services of A. R. Burr and J. E. Olen, former secretary-treasurer and vice president, respectively, of the C. J. Smith Company, and as a result of this amalgamation the company has increased its capital by $50,000 and has added to its big stock of automobile and motorcycle supplies. A new building on West Sixth street will be built in the near future, the contract having been awarded.

Digitized by Google

F. W. Ramm, proprietor of a garage at St. Petersburg, Fla., which bears his name, has decided to incorporate in order that a larger and more complete establishment can be maintained to care for increasing business. The capital will be $100,000 and many of the leading business men of the South have subscribed for stock.

Dillon Court Garage, at the rear of Dillon Court Hotel, Hartford, Conn., is the latest addition to that city's automobile establishments. Yetter & Morse have the management. The garage is large and modern and in addition to a first class repair department a line of automobile accessories is carried.

Fred Barnum, Waterbury, Conn., has sold his garage at 52 South Main street to Richardson Bros., who will conduct a similar establishment at 70 South Main street. The purchasers state that for the present both plants will be operated.

The Universal Motor Truck Company, Cleveland, O., is a strong addition to the automobile houses of that city. The sales and service departments are located at 2352 Euclid avenue. C. W. Moody is general manager and M. J. O'Connor and J. A. Boyd will have charge of the sales department.

Lamb-Daniel & Co., which has opened offices at 712-713 Union Trust building, Detroit, for the purpose of representing manufacturers of automobile parts and accessories, has started its career with a splendid business. Mr. Daniel was formerly connected with the sales department of the Cartercar Company, maker of Cartercars, and previous to that with the Castle Lamp Company, Battle Creek, Mich. Mr. Lamb was formerly manager of the Franklin Company. Lamb-Daniel & Co. will handle a complete line of automobile accessories.

W. K. Hurd and A. K. McRae of the Florence Auto Company, Florence, Col., have purchased the business of the Sunville Auto Company and the Overland Auto Company of Pueblo, Col., and will in future devote their attention to the sale of Ford cars, made by the Ford Motor Company, Detroit. The firm will be known as the Arkansas Valley Auto Company and will be located at Sixth and Court streets, Pueblo. Mr. McRae will have charge of the business, while Mr. Hurd will look after the interests of the firm at Florence.

Charles Pendleton, Keota, Ia., has purchased the garage formerly owned by Chester Stewart, for $5750. He is building an addition at the rear, in which he will install a completely equipped repair shop which will have lathe, drill press, milling machine and planer. A high pressure boiler will heat the building and also provide heat for the vulcanizing plant.

City Hall Garage Company, Inc., Paterson, N. J., of which Bernard Katz is proprietor, is to have a large addition, doubling its floor space, and costing $4000. The building now covers 25-29 Union street.

C. E. Miller of Cordele, Ga., has purchased the garage of Dr. A. B. McQueen at Tarpon, Fla.

C. W. Maxim, manager of the Middleboro Auto Exchange, Middleboro, Mass., New England distributor for the McFarlan car, announces the appointment of L. H. Roberts as director of wholesale sales. Mr. Roberts formerly held a similar position with the Studebaker Boston branch, and before that was connected with the Marmon and Lozier forces in various sections of the country. This arrangement leaves C. W. Maxim free to devote his entire attention to the service department. E. L. Maxim retains his position as advertising and publicity manager.

The Southwestern Motor Sales Company, Dallas, Tex., has been formed with a capital of $500,000. L. A. Boll is president and associated with him are the following: Vice presidents, C. Charles Jones and Martin A. Steward; secretary, W. L. Marsh, treasurer, N. E. Jones. The firm is located at 1608 Commerce street and will represent the Lozier, Speedwell, Staver and Little automobiles and the Staver and Speedwell trucks. C. R. Jones will have charge of the truck department.

James Morris, who recently withdrew from the management of the Chalmers repair shop of the Union Supply Company, Toledo, O., has entered business for himself at 109-111 Eleventh street. His plant is equipped for all kinds of repair work.

The Michigan-Georgia Motor Company, Atlanta, Ga., has begun business under auspicious circumstances as agent for the Michigan machines, made by the Michigan Motor Car Company, Kalamazoo, Mich. John D. Wells is president and H. C. Tuggle is vice president. R. M. Northcutt has charge of the sales department and has associated with him many salesmen well known in the automobile field.

The Warsaw Auto Company, Warsaw, Ind., has been incorporated by Allae S. Widaman, Walter Stanley and John E. Armstrong. The new company will operate the Stanley & Armstrong garage at Leesburg, Ind., and the Widaman garage at Warsaw and will act as agent for the Studebaker, Hudson and Overland lines.

G. R. Dillon and Max Wolcott have formed a partnership and will conduct a general automobile business at the garage at Tioga avenue and Pine street, Corning, N. Y. Both men are experienced in the automobile trade.

The Michigan Motor Company, Washington, D. C., has been incorporated to handle the product of the Michigan Motor Car Company, Kalamazoo, Mich. The officers of the company are: President, T. Oliver Probey; vice president, J. H. Stuart; secretary and treasurer, George R. Stuart; sales manager, F. C. Sibbald; service department superintendent, E. G. Powell. Salesrooms and a service station have been established at 1230 Wisconsin avenue.

The Dupont Garage Company, Washington, D. C., is a newly organized selling company of which Raymond A. Klock, formerly senior salesman of the United Motor Washington Company, is sales manager. J. E. Connelly, general manager of the Dupont Garage Company, will supervise the business of the new concern. E. W. White, who has been identified with the Hudson interests at Washington, will assist Mr. Klock in the sales department. This branch will be located at 1321 14th street, northwest, and arrangements have been made for prompt and efficient service to Columbia, Hudson and Hupp-Yeats owners at the service station of the Dupont Garage Company, 2020 M street, northwest.

The Petty-Calhoun Company, Macon, Ga., has been dissolved and its garage discontinued. Mr. Petty has retired from the business and R. L. Knight and C. F. Calhoun, the other members of the firm, have merged their interests with the Macon Auto Company, 519 Poplar street.

William J. Miller and R. M. Weaver, who recently purchased the Broad-Oak automobile garage, Columbus, O., have extended the business, securing an additional floor in the building, which has been converted into one of the most completely equipped repair shops in the state. Mr. Miller, former builder of the Frayer-Miller engines, is in personal charge of the repair department.

The Barlow Garage Company, Newark, N. J., recently organized to maintain and repair electric pleasure and commercial vehicles, which at present is operating in the old Lansden factory at 233-235 High street, has leased the building now being erected at 133-135 Washington street. When completed the garage, which is a two-story fireproof structure, will have facilities for charging 60 vehicles daily.

William Pratt, Riverside, Cal., is in charge of a new salesroom and garage at 446-448 Eighth street, in which also will be located the newly acquired agency for Ford cars, made by the Ford Motor Company, Detroit.

Luts & Weaver, Ashland, Ky., has established a new automobile garage on Front avenue. They will handle the Buick cars, made by the Buick Motor Company, Flint, Mich.

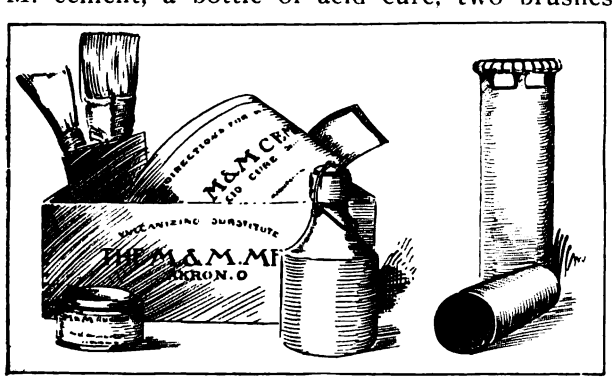
The Adirondack Motor Company, Hudson Falls, N. Y., has purchased land at 188 Main street as a site for a new, modern garage. The company distributes Overland machines and maintains branches at Albany, Troy and Saratoga.

H. A. Storer, Cambridge, Mass., will erect a new brick garage on West street. He has made application to the city for a permit to erect the building.

Van Winkle Bros. & Weister, San Fernando, Cal., has erected a fine new garage. The company is agent for the Studebaker cars, made by the Studebaker Corporation, Detroit.

The Southern Garage has purchased the store of the Central Auto Company on 13th street and the stock will be moved to the garage on Chester avenue, Bakersfield, Cal.

W. S. Sandeman, proprietor of "Sandy's auto garage," 57 Boylston street, Cambridge, Mass., has doubled the floor space of his fireproof building. The garage now has a total floor space of over 7000 square feet. There is a large machine shop, an office and workshop, where a specialty is made of ignition and carburetion repairs.



Digitized by Google

M. & M. QUICK REPAIR TIRE KIT.

Complete Outfit That Materially Aids the Motorist While on the Road.

To patch an inner tube successfully it is essential that the cement be cured properly else the patch will not adhere to the tube, as some motorists who have attempted repairs on the road have discovered by experience. Vulcanization may be secured through the application of heat or by the acid process which is based upon the principle that certain chemicals when applied to rubber cement produce a cure similar to that obtained with heat, and as permanent.

The formula utilized by the M. & M. Manufacturing Company, Akron, O., is based upon the chemical acid cure which makes it possible for the motorist to repair successfully any puncture or blow-out either on the road or in the garage, and a quality of the quick repair kit is its simplicity of operation. The outfit comprises M. & M. cement, a bottle of acid cure, two brushes

The M. & M. Quick Repair Kit and Inner Tube Splicer, Making for Economy of Tire Maintenance.

and emery cloth, these being neatly packed in a small box stored conveniently in the car.

With this outfit augmented by an inner tube splicer, shown in the accompanying illustration, damaged inner tubes may be made as good as new by splicing, the operation being performed easily and quickly. Tubes may be lengthened or shortened to fit different diameter tires, making for economy.

One of the specialties of the company is M. & M. Knead-it, a preparation for filling cuts in casings, which if neglected develop into blisters and ultimately allow moisture to reach the fabric, paving the way for a blow-out. Knead-it is easily applied and makes a permanent repair without vulcanizing. The M. & M. Manufacturing Company makes a specialty of tire sundries, including cementless patches, tube sleeves for splicing, cement, reliners, etc. The company issues an instructive booklet upon tire and inner tube repair and maintenance which will be forwarded free upon request.

FALL RIVER CHAUFFERS ORGANIZE.

Form an Association for Mutual Benefit and Invite Out-of-Town Men to Call.

The professional chauffeurs in Fall River, Mass., have united in the Fall River Chauffeurs' Association, which was organized Oct. 11. Headquarters have been established at room 10, City Savings Bank building, where weekly meetings are held Wednesday evening, and where touring chauffeurs and drivers are invited to call and make themselves at home when in the city. Besides paying a weekly sick benefit, the association maintains an employment bureau where reliable chauffeurs can be procured, and an information bureau, which supplies maps and touring data to visiting motorists as required. Just at present plans are under way for the first annual ball, Jan. 20.

The officers of the association are: President, Patrick Halligan; first vice president, Thomas Daley; second vice president, James E. Shea; treasurer, Frank O'Neil; financial secretary, William Storey; recording secretary, Nelson Fontaine; sergeant-at-arms, James Fraser, Jr.; trustees, Merton S. Smith, Edward Carrier and Emile Fisher.

MAGNETOS IN CARLOAD LOTS.

Remy Electric Company Is Thus Compelled to Fill Orders from Two Customers.

Few persons realize that the volume of business done by one Indiana accessory firm is greater—that it requires more men and a bigger factory—than some well known motor car manufacturing concerns. The Remy Electric Company's plant at Anderson affords several hundred thousand feet of floor space and employs over 1000 men, who work in day and night shifts, in producing ignition, lighting and starting systems.

During October this concern shipped 13,055 magnetos, which is at the rate of 156,660 a year. About 14,000 were shipped in November. The production reaches as high as 875 complete magnetos and coils a day. The instruments are delivered to two firms, the Willys-Overland and Buick, in carload lots.

THE NEW YORK SHOW.

Exhibit of Machine Tools Will Be an Important Added Feature This Year.

A machine tool exhibit will be an added feature at the 13th national automobile show in Madison Square Garden and Grand Central Palace, New York City, Jan. 11-25, this having particular reference to the second portion, or that beginning Jan. 20, when the commercial vehicles will be the centre of attraction. This decision was reached last week after a conference between Secretary Merle L. Downs of the Automobile Board of Trade's show committee, and President Bullard of National Tool Builders' Association.

That this is to be an accessory year is now pretty generally known and appreciated, but it is learned that a large number of makers are reserving new products of this nature for their initial appearance at the show. The list of exhibitors indicates that there will be no less than 530 separate concerns represented, of which 43 makers of pleasure cars and 272 accessory firms will display their wares the first week, and 25 truck manufacturers will exhibit the second week in the Garden. At the Palace, 46 pleasure car makers, 25 motorcycle concerns and more than 100 accessory firms will be seen the first week, and at least 41 truck producers the second. The vehicles will be divided as follows:

Madison Square Garden, First Week.

Alco, Auburn, Buick, Cadillac, Cartercar, Chalmers, Columbia, Cunningham, Stoddard-Dayton, Flanders, Franklin, Garford, Haynes, Hudson, Jackson, Knox, Locomobile, Lozier, Matheson, Maxwell, Mercer, Mitchell, Moline, Moon, National, Marmon, Oakland, Oldsmobile, Packard, Peerless, Pierce-Arrow, Pope-Hartford, Premier, Pullman, Reo, Selden, S. G. V., Stearns, Stevens-Duryea, Warren, White, Overland and Winton.

Madison Square Garden, Second Week.

Alco, Autocar, Buick, Federal, Garford, G. M. C., Gramm, Hewitt, Hupmobile, Kelly-Springfield, KisselKar, Knox, Locomobile, Mack, Packard, Peerless, Pierce-Arrow, Pope-Hartford, Reo, Saurer, Selden, Speedwell, Velie, Walter and White.

Grand Central Palace, First Week.

Abbott, American, Atlas, Bergdoll, Briggs-Detroiter, Buffalo, electric, Church-Field electric, Cole, Firestone-Columbus, Cutting, Davis, Edwards-Knight, Empire, Fiat, Havers, Henderson, Herreshoff, Hupmobile, Stutz, Imperial, Inter-State, Rambler, KisselKar, K-R-I-T, Lenox, Marathon, Marion, Metz, Michigan, Pathfinder, Norwalk, Only Car, Paige, Paterson, Case, R-C-H, Regal, Speedwell, Standard electric, Studebaker, Velie, Westcott and Republic.

Grand Central Palace, Motorcycles, First Week.

Eagle, M-M, Thor, Yale, Emblem, Excelsior, Flanders, Greyhound, Harley-Davidson, Indian, Henderson, Flying Merkel, Minneapolis, New Era, Pierce, Pope, R-S, Schickel and Triumph.

Grand Central Palace, Second Week.

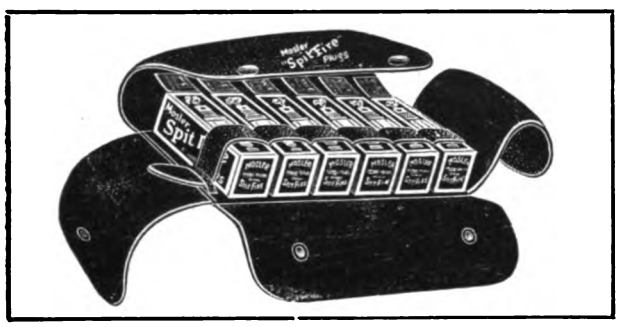
Atlantic, Atterbury, Baker, Bessemer, Blair, Modern, Brown, Buffalo, Chase, Dart, Durant-Dort, G. M. C., General Vehicle, Gramm-Bernstein, Grand Rapids, La France, Koehler, Lansden, Lauth-Juergens, Lippard-Stewart, Mais, Mercury, M. & P., Randolph, Rowe, Sanford, Schacht, Service, A. O. Smith, Standard, Stegeman, Sternberg, International, Stewart, Studebaker, Sullivan, Universal, Ward, Waverley, Webb, Maccarr and Kreb.

NEBRASKA'S GOOD ROADS BILL.

State Automobile Association Prepares Legislation Creating Highway Commission.

At the recent convention of the Nebraska State Automobile Association a bill was prepared for introduction into the legislature, creating a state highway commission, the members of which shall receive no compensation, except their actual expenses. The commission will have power to employ a competent engineer, who will work under its direction, and sufficient clerical assistance.

Among the proposed duties of the commission will be that of investigating and carrying on experimental work in road and bridge building, different methods of construction, kinds of material and the various methods of drainage which will be best adapted to the soil of the separate sections of the state.



It is now assured that Dallas, Tex., will have an automobile show which will rank as the biggest ever attempted in Texas. It is anticipated that it will attract many from Louisiana, Oklahoma and Arkansas. Space has already been reserved by branch houses in Dallas and so favorably has the project been received that J. S. Berger, who is arranging the details, is confident of success.

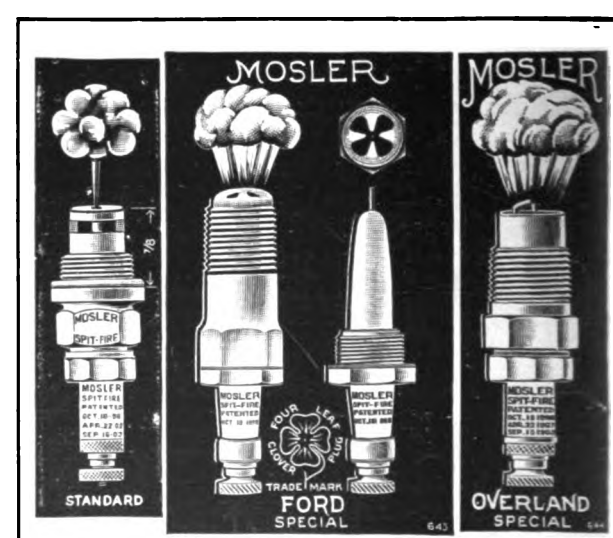
MOSLER'S CHRISTMAS PRESENT.

Spit Fire Spark Plug Maker Also Specializing in Plugs for Particular Motors.

As a Christmas present, the offer extending from Dec. 1 until the close of the New York

Leather Spit Fire Spark Plug Case, Which A. R. Mosler & Co., Offers as a Christmas Gift.

shows, A. R. Mosler & Co., Mt. Vernon, N. Y., is giving with each order for six platinum pointed, .5-inch metric or 7 8-18 platinum pointed Spit Fire spark plugs, a handsome genuine leather Spit Fire spark plug case, like that illustrated herewith. The case not only holds the plugs in their individual cartons, the strap being so arranged that they may be carried in the original packages, but affords the proper protection for the extra members which the careful driver has with him.



Another important announcement is made by this concern in that it is maintained that almost every engine built for 1913 cars embodies some peculiarity or eccentricity, these features changing conditions so that it has been deemed advisable to specialize in plugs for several of the foremost motors now being used. In the future each plug sold will carry a special tag stating for what particular car it has been designed.

The cylinder walls of every motor vary, according to the Mosler concern, thereby making it necessary to furnish plugs of different lengths in order to bring the bases far enough through the wall to make them self-scavenging. One cylinder cap is held to require a longer threaded plug than another. If the plug is set in a recess it is considered advisable to have a deep chamber construction to make the member easily accessible and convenient for ordinary or even special wrenches.

The question of placing the ignition spark in the proper manner at the exact point in the cylinder where it will give the best results has been studied with much care by this company and it is stated that many of the 1913 models of the leading factories will be found equipped with Mosler's special plugs, some of which are shown in an accompanying illustration. Some engineers specify the closed end Spit Fire type with platinum points, while others have chosen the open end plug, either with one or two points, as best suited to their motors. This discriminating policy of the manufacturers has resulted in about 20 new models of the Spit Fire, some of which will be found on the following cars: Alco, Atterbury, Bergdoll, Chalmers, Cunningham, Dorris, Fiat, Hudson, Lippard-Stewart, Locomobile, Paige, Pierce-Arrow, R-C-H and White.

In this connection it will be proper to note that Mr. Mosler has issued the third edition of his spark plug size booklet, which gives the size of plugs used on each American made automobile. This valuable information is for free distribution to those who make request of the company.

At the annual meeting and dinner of the Long Island Automobile Club, held at the club house in Brooklyn, N. Y., Charles Hermann was elected president. Mr. Hermann became a member of the club in 1905 and since that time has been active in the interests of the organization. He served as secretary in 1911 and for the past year has been vice president and chairman of the entertainment committee. Other officers elected

Some of the New Spit Fire Spark Plugs: At Left, Standard Design; in Centre, Ford Special and Detailed Construction; at Right, Overland Special.

were: Vice president, Herbert G. Andrews; treasurer, J. S. Frazee; secretary, F. H. Newcomb; trustees until 1914, C. H. Galt, Edward Ashforth, A. W. Seaman.

What an awful game of chance we sometimes play on the checkerboard of Life!
How narrow is Life's victory over Death at times!
What a contrast is here presented! What an object lesson this scene portrays!

Absolute control and **perfect safety** on the one hand; on the other an "unruly balky" machine, whose seemingly greatest ambition was to bring its occupants face to face with disaster.

Picture for yourself the story:

Two cars traveling the same country road—a rainstorm overtakes them. Reaching a treacherous, slippery curve—

ONE CAR with scarcely any noticeable slackening of speed rounds the curve and **passes on in perfect safety.**

THE OTHER at the critical moment, **skids,** and in a flash, plants itself in front of the on-rushing trolley.

A mass of wreckage, "nerve-shattered" passengers and a lasting memory of what might have been if the trolley car had not been stopped.

One Car was skid-proofed with Weed anti-skid Chains. **The Other** was not. Take the lesson home.

Weed Chains

Absolutely Prevent Skidding

Are you still taking your life in your hands by refusing to take the necessary precaution against the dangers of skidding? Are you still unwisely depending on "rubber alone" for the safety of yourself, the occupants of your car and other road users?

Make safety yours—take no chances. Fully equip your own car with Weed Chains today and **insist,** for your own protection, that other drivers do the same.

Weed Chains cannot injure tires because "they creep;" are put on in a minute without the use of a jack or other tools. Use them on all four tires.

More Speed and Power With Less Gasoline.

The M. & M. Economizer will increase your speed 20% with less gasoline and less carbon. Saves from 40 to 50% of gasoline, and is the only known carburetor adjuster on the market. It is attached to the intake pipe, and requires but a ¼" pipe tap.

Price complete f. o. b. Philadelphia, $3.50. This includes Friction foot pedal. When sent by mail add 17c extra for postage.

BEWARE OF INFRINGEMENTS.
Money Refunded if Unsatisfactory.

Our motorcycle size is made for a ¼" pipe tap. It can also be used on automobiles for speeding and priming.

Send for our 1913 *catalogue, which gives full particulars.*

Price of our motorcycle attachment **$1.25 Prepaid**

A NEW VALUE

TO THE PURCHASING POWER OF FIFTY CENTS—A

"BLACK EAGLE" SPARK PLUG.

EFFICIENCY AND QUALITY WITHOUT EXTRAVAGANCE.

From all viewpoints the **"BLACK EAGLE"** Spark Plug represents the greatest advance in spark plug design and construction in recent years, and has given a new value to the purchasing power of fifty cents.

The base of the **"BLACK EAGLE"** Spark Plug provides double electrodes so positioned that they present a round surface to the action of the spark, absolutely eliminating pitting of the electrodes which indefinitely prolongs their life, and produces a uniform spark at all times.

When you have discovered that the price you pay for a spark plug has little to do with its service value, you will save 100% to 400% on this item of expense. Try a genuine

"BLACK EAGLE"

The 50c Spark Plug Without an Apology. TRY THEM NOW.

Don't wait until you are 10 miles from a Garage and find you need them.

Most jobbers and dealers sell **"BLACK EAGLE"** Spark Plugs. All can secure them; if you are unable to have your wants supplied we will forward them free of transportation expense upon receipt of price.

"INVADER" GEAR OIL

"Puts Noisy Gears to Sleep"

INVADER GEAR OIL is a heavy, dark fluid lubricant, designed for the lubrication of sliding gear transmissions and differential gears. It can also be used for front gears where a heavy lubricant is required, if the case is tight and separate from the crank case.

This oil possesses peculiar properties which make it invaluable as a lubricant for gears. It contains no foreign matters, such as ground cork, sawdust, etc., but is 100% oil. It is stronger and more serviceable than any other lubricant made. Being free from water and chemicals, it will not foam in the gear case when running or allow the bearings to rust when idle.

Invader Gear Oil being a fluid lubricant it is only necessary to fill the case sufficiently to allow the gears to dip. It is not necessary to pack the case full, as is customary when grease is used. It faces the gears with a coating which is practically indestructible, thereby preventing wear and reducing *noise* and friction to a minimum. A trial will convince the most skeptical that "**Invader**" Gear Oil is the only practical and economical gear lubricant.

Sold in 10 lb. square cans, lithographed; 25 and 50 lb. wooden jacketed cans, special top; barrels and half-barrels

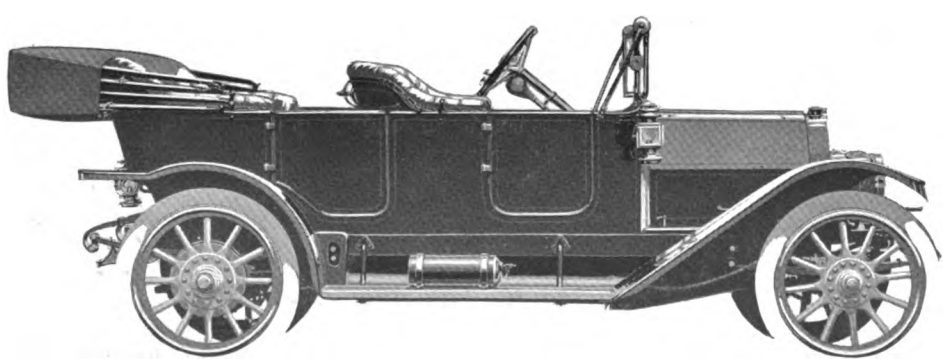
$985 Overland $985

Completely Equipped

Self-Starter	Remy Magneto
30 Horse Power	Warner Speedometer
5-Passenger Touring Car	Mohair Top and Boot
110-Inch Wheel Base	Clear Vision Wind Shield
Timken Bearings	Prest-O-Lite Tank
Center Control	

High-priced feature No. 2



When an auto wheel hits a rut the frame must bend. Most popular priced makers try to hold the motor and transmission rigid by a *number* of arms. Overland motors are suspended at but three points. This method absolutely prevents disalignment. Otherwise, crank or gear cases bend and throw the engine bearings out. Disalignment prevents proper lubrication. It works general havoc with motor and transmission.

Experiment for yourself with three and four legged stools.

This is just one of the high-priced features in the Overland at $985. A catalogue for the asking tells you of the many others. Please address Dept. 52.

The Willys-Overland Company

Toledo, Ohio

When Writing Advertisers, Please Mention The Automobile Journal.

THE 8-DAY HIGH GRADE "CHELSEA" AUTO CLOCK

"SPECIAL"

"OFFSET"

"ROUND"

"LIMOUSINE"

Primarily intended for use inside the bodies of large enclosed cars, and for such use its case can be given a variety of fine finishes. It also makes an attractive clock for use on dashboards. Only made in 2¾-inch size.

The Justly CELEBRATED 8-Day, High-Grade "CHELSEA" AUTO CLOCK (*Trade-mark*)

NOW and for YEARS the RECOGNIZED STANDARD of EFFICIENCY

Clocks built with a view to stand the jars and jolts and rough riding of Automobiles. Reputation the highest. Used by parties demanding the BEST.

☞ ALL SIZES STATED ARE THE APPROXIMATE DIAMETERS OF THE DIALS.

All are 8-day High-Grade. All are in DUPLEX (patent applied for) polished cast brass cases, the most thoroughly waterproof case on the market. The "SPECIAL" clocks show dial on an angle; its inner cased clock, when removed from the outer (locked) case, is excellent for use on mantels, bureaus, etc., when touring; its outer case is screwed to dashboard by hidden screws. The "SPECIAL" clocks are in large demand from dealers for owners of finest cars.

The MOTOR CLOCK has the same clock movement which for years we have supplied for the hard use on Locomotives, Steam Fire Engines, etc.; its dial is of same appearance as the Auto Clock dial, but the Auto Clock movement has a somewhat finer train.

The 3⅛ MOTOR "OFFSET" is likely to prove a quick, ready seller. Very attractive.

Ask for our new Auto Clock Circular and Price List, dated Oct. 1, 1911, illustrating and pricing the above and three new models, C, D and E.

PRICE LIST (Per Clock)

		"Round"	"Offset"	"Special"	"Limousine"
"CHELSEA"	2¾-in. Auto Clock.....	$26 00	$28.00	$36.00	$28.50
	3½-in. Auto Clock.....	28 00	30.00	45.00	Only made in
	3⅛-in. Motor Clock.....	24.00	26.00	41.00	2¾-inch size

If wanted fitted with outside (patent applied for) stem-winding and stem-setting device—the best of its kind—Add $3.00 to above Price Lists. (Such device we do not apply to the "Motor" Clocks or "Special" Auto Clocks.)

For Use on AUTOMOBILES and MOTOR BOATS

You want the Best? Ask your DEALER for the "CHELSEA"

On Sale by Leading Jobbers and Dealers

An Insurance Policy AGAINST ACCIDENTS

TRADE MARK Raybestos REG. U.S. PAT. OFF.

"THE ORIGINAL AND BEST RAYBESTOS BRAKE LINING"

90% of Automobile Accidents Are Due to Faulty Brakes

The efficiency of even the BEST brakes is nullified by low quality brake lining

RAYBESTOS—the best lining—increases the efficiency of any brake.

It grips and *holds*. It *stops* the car. It wears longest and makes the car safe—it offers insurance against accident.

RAYBESTOS is made of the highest quality long-fibre asbestos woven with copper wire. Specially treated. Heat-proof. Woven evenly throughout. Gives a wall of strength to the brakes.

Insist upon getting RAYBESTOS. Avoid "cheap" imitations. We stamp the name "RAYBESTOS" in every foot of the lining. This is your guarantee that you are buying the best lining the industry produces. Ask your dealer.

The Royal Equipment Company

422 Housatonic Ave. Bridgeport, Conn.

We also make Duplex and Raymond Brakes and Gyrex, the Mixer.

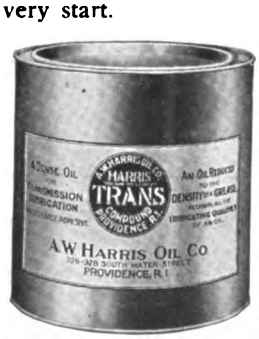
A LITTLE GOES A LONG WAY

AND EVERY DROP COUNTS

MORE POWER, GREATER EFFICIENCY, LESS EXPENSE

HARRIS OILS give you maximum engine power. They add to the efficiency of every motor. They give real lubrication at less expense than any other lubricant on the market. This is not a mere advertising claim. The statement is easily verified. Ask any of the thousands of motorists who use

HARRIS



TRADE MARK REG. U.S. PAT. OFF.

OILS

They are quality lubricants—without doubt the best. Every analysis, every known test proves this fact.

The A. W. Harris Oil Co. PAYS A PREMIUM to secure the highest grade of Pennsylvania crude stock.

Therefore, HARRIS OILS are made right—made honestly from the very start.

Over a quarter of a century in the manufacture of cylinder lubricants goes into HARRIS OILS.

The soot-deposit ingredients are eliminated to the greatest possible extent. A great army of HARRIS OIL users will testify that they have less trouble, less expense, and that they get more mileage per gallon and added power than with any other known lubricant.

A. W. HARRIS OIL COMPANY

326 S. Water St., PROVIDENCE, R. I. 143 No. Wabash Ave., CHICAGO, ILL.

Automobile Journal Show Numbers

NEW YORK: January 10th and 25th

CHICAGO: January 25th, February 10th

BOSTON: March 8th, March 25th

These shows are for the benefit of the owners and the enthusiasts who are considering purchasing. Ninety per cent. of the circulation of the AUTOMOBILE JOURNAL reaches the hands of readers that are within a few hours' ride of New York City, and this clientele is composed almost exclusively of owners.

Because the AUTOMOBILE JOURNAL is an exclusive automobile owners' magazine, because it has a distribution concentrated in this field, because it will reach the buyers who will attend these displays, it has a value to the advertiser that cannot be equalled by any other motoring paper.

To make the advertising sections of the magazine as distinct and as productive to our patrons as is possible, and to make them doubly attractive to the readers, all page advertisements will be printed on a fine grade colored coated paper, and at no additional charge over regular rates.

For advertisements in colors, which will give distinct insert effect on this stock, a nominal charge of $10 per color over regular rates will be charged. (Standard colors, red and black.)

No reservation for copy that is to appear in colored sections can be accepted after Jan. 4. Reservations orders will be given positions in the order of receipts.

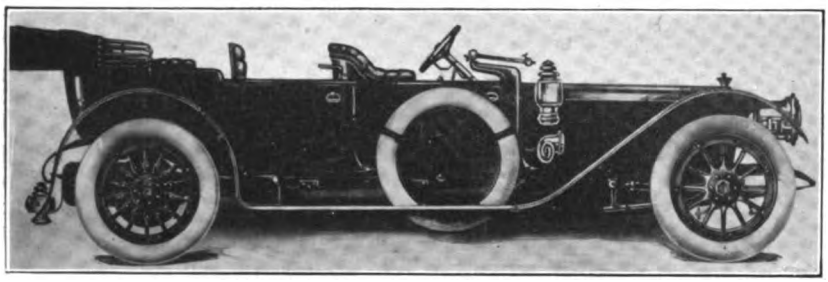
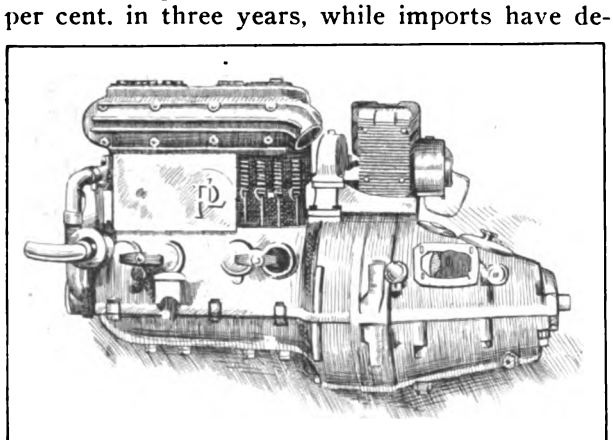
1913 Importers' Salon January Second Tenth

Hotel Astor New York City

BECAUSE the 1913 salon of the Importers' Automobile Alliance in the grand ball room of the Hotel Astor in New York City, Jan. 2-10, will inaugurate the American motor car show season for the new year, it will prove of decided interest. It will be distinctive in that none but machines of foreign design and manufacture will be on display.



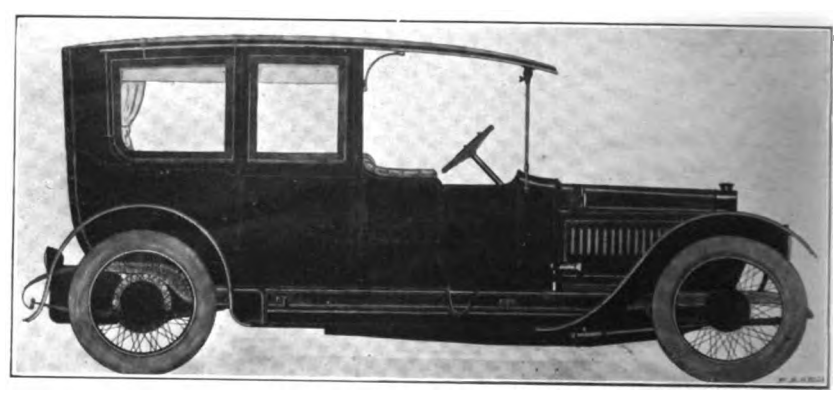
The influence which has been exerted by European engineers upon the industry in the United States dates from its very inception. This influence has been reflected alike in the development of the pres-



Digitized by Google

Twenty Horsepower Panhard Chassis, Fitted with New Torpedo Body.

ent day car and in the business of the American manufacturer. Within the past three years the record of imports and exports has shown a marked advance in the number and value of machines shipped abroad and a slight decrease in the importations. This situation has had the effect of more energetic endeavor on the part of the foreign producers to secure and retain custom in this country. There can be little doubt that the forthcoming salon will have for its principal object the stimulation of business in this particular field.



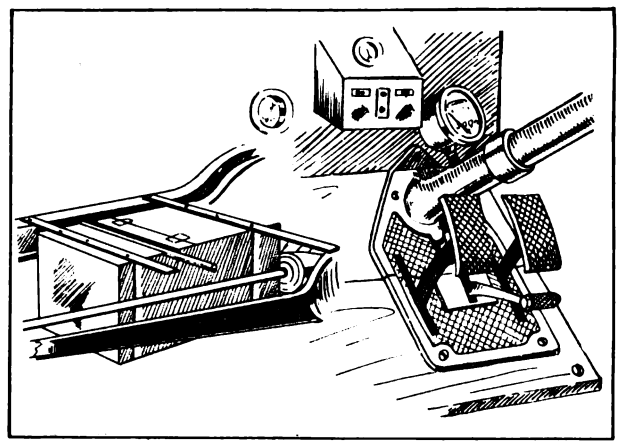
Considering the matter of imports and exports in more detail: It appears that for the first 10 months of 1912, the only period for which governmental records are now available, automobiles and parts to the value of $1,814,846 were imported, as against $1,924,273 during the same period in 1911, and $2,364,248 in 1910. On the other hand the exports for the same periods were valued as follows: 1910, $11,191,638; 1911, $15,344,677; 1912, $23,772,221. These figures show an increase in exportation value of a little over 112 per cent. in three years, while imports have decreased approximately 23 per cent. in the same time.

Panhard Unit Motor and Gearbox, with Dynamo Mounted on Top of Crankcase.

Five nations will be represented in the 1913 salon—France, Germany, Italy, Belgium and Austria. During the first 10 months of the year, in each instance, cars in number and value were shipped to America as follows: France—1910, 479, $897,950; 1911, 262, $567,665; 1912, 384, $914,639. Germany—1910, 103, $259,352; 1911, 129, $280,385; 1912, 45, $105,131. Italy—1910, 153, $280,388; 1911, 100, $159,188; 1912, 80, $129,551. The figures from Belgium and Austria mentioned are not available, being listed under the heading of "other countries" in the report of the Department of Commerce and Labor.

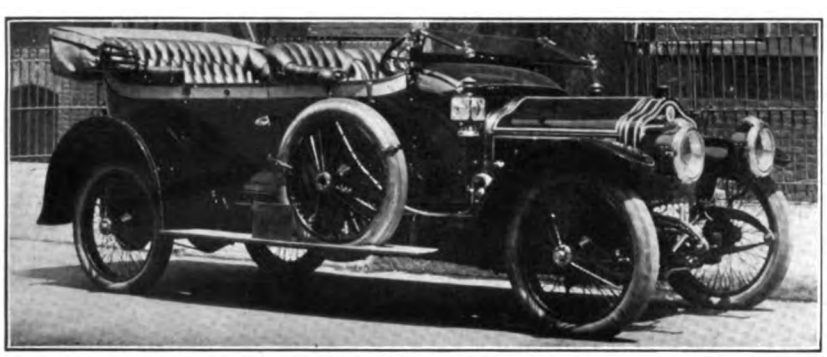
Perhaps additional information will be obtained from a consideration of the average value of these cars. Those imported from France in 1910 had an average valuation of $1875; in 1911, $2167, and in 1912, $2408. From Germany, the figures were: 1910, $2518; 1911, $2174; 1912, $2341. From Italy, they were: 1910, $1832; 1911, $1592; 1912, $1620.

Thirty Horsepower Six-Passenger De Dion-Bouton Landaulet Limousine.



The export side of the ledger shows the following facts with respect to these three countries: France—1910, 207 cars, valued at $637,734, and averaging $3080; 1911, 366, $413,030, $1128; 1912, 585, $439,313, $751. Germany—1910, 102, $413,030, $2913; 1911, 95, $112,126, $1179; 1912, 392, $316,201, $807. Italy—1910, 106, $347,652, $3279; 1911, 167, $192,339, $1152; 1912, 254, $224,436, $884.

Thus it would appear that while the average value of cars sold in America by foreign producers has remained practically the same, the cars of American manufacture sold abroad have de-

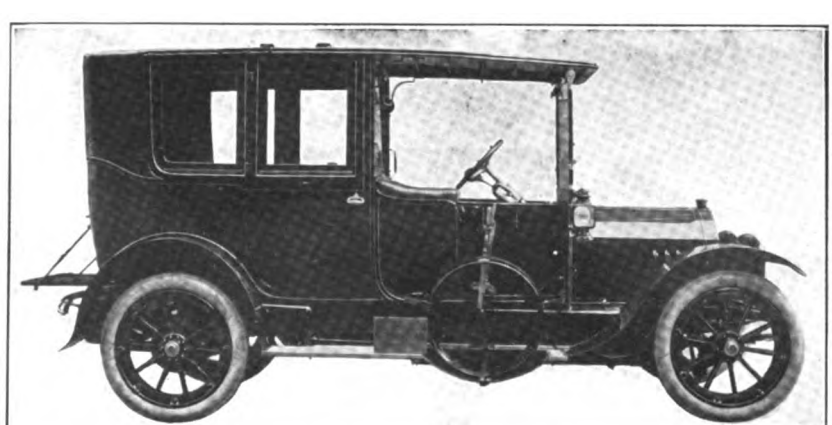


Digitized by Google

creased materially in value, so that the balance of business done weighs even more largely in favor of the United States than the first figures quoted would seem to indicate. It is not surprising, in the face of these facts, that European manufacturers should be anxious to bring the merits of their productions to the attention of the American public.

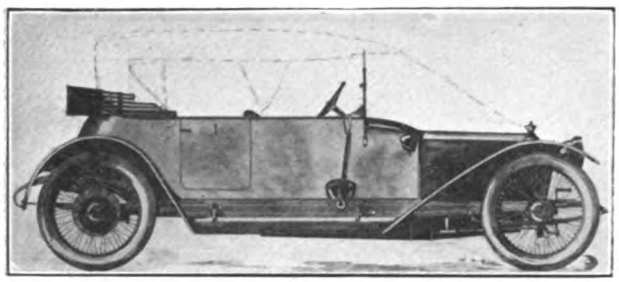
The number of exhibitors will not be large, when compared with the list of those who will make display at the Madison Square Garden and Grand Central Palace, immediately following the close of the salon. Those who will exhibit cars are: De Dion-Bouton American Agency, De Dion-Bouton; Mercedes Distributing & Importing Company, Mercedes; Panhard & Levassor Selling Branch, Panhard; Metallurgique Motor Company, Metallurgique; Renault Freres Selling Branch, Renault; Minerva Motors Company, Minerva; Isotta-Fraschini Motor Company, Isotta-Fraschini; Adams-Lancia Auto Company, Lancia; Healy & Co., Austro-Daimler.

Lancia Features: At Left, Tool Box Within Frame; at Right, Steering Column Bracket and Control Pedals.



Minerva-Knight Chassis, Equipped as Five-Passenger Touring Car.

The De Dion-Bouton line, made in France, includes four chassis rated at 12, 14, 18 and 26 horsepower. The last named continues the eight-cylinder motor of last year, but with a slight increase in the bore. The cylinders are arranged in a V, and the Bosch magneto is placed between the two sets of four and over the flywheel. Pressure for the gasoline is obtained from a plunger pump driven off the magneto shaft, and for starting purposes a small auxiliary tank is fitted, the supply in which is replenished from the main tank. The inlet pipes are separate and the exhaust pipes are formed into a casting faced and bolted to the cylinder casting. Final drive is by an overhead worm. Electric lighting is by the C. A. V. system described in full elsewhere in this issue.

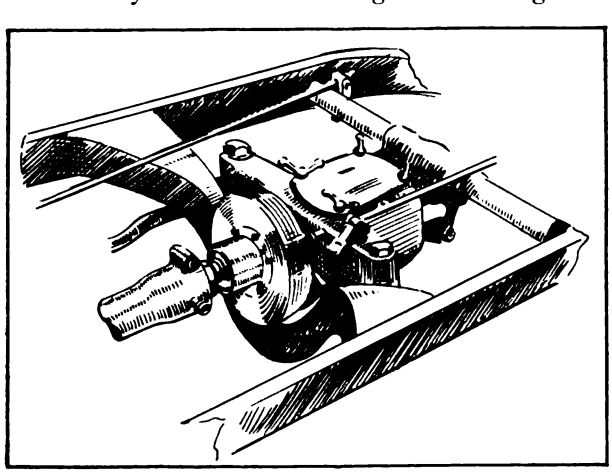


In the smallest model the timing gear is now driven by inverted tooth chains. The sleeve between the engine and gearbox is made of aluminum, exceedingly light and lined with steel, driving through bronze squares working in steel grooves in the liner. In the gearbox, which is very compact, the shafts are placed one above the other, and over-lubrication is held to be impossible because of the position of the oiler. Another feature is the underswept cross member over which the gearbox is located.

The Mercedes is a German representative and also is produced in four chassis models, rated at 15-20, 25-30, 35-40 and 45-50. The largest car

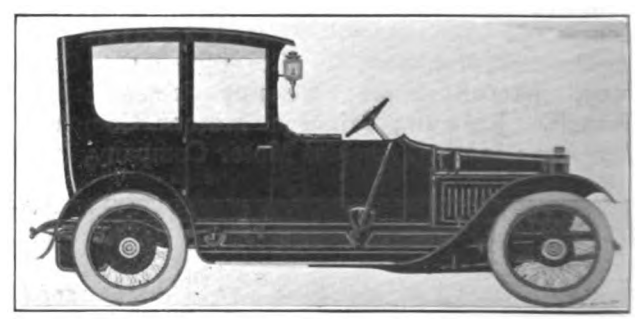
Mercedes Landaulet Limousine with Patent Leather Doors and No Cowl.

Digitized by Google



Holbrook Torpedo Body on Panhard Chassis.

presents some new features, among which may be mentioned the double bevel drive in the rear axle, in which the differential is placed on the driving bevel pinion shaft. The timing gear is placed between the cylinder pairs. An extra circular air slide has been introduced on the carburetor. The valve caps and the cap on the fuel tank have been so designed as to conform with that on the ordinary gasoline tin sold abroad, and may be loosened by a tire lever or other similar tool.



The chief constructional feature is the propeller shaft casing with its diagonal struts, the front centres of which coincide with the universal joint. An oil pipe is led to the universal joint casing, so that lubricant can be forced to it by the engine and the supply may be regulated from the dash. In addition, the double cross members at the back of the gearbox, in which the channels meet at the centre and are splayed out towards each of the longitudinals, is held to make for a decidedly stiff frame.

The Panhard is another French car. This is presented in three models, rated at 12, 15 and 25 horsepower, the last named being fitted with a four-cylinder Knight engine. The other motors are four-cylinder block castings. The Knight engined chassis is practically without change, with the exception of the introduction of a ring fed oil bath at the front end of the universal joint on the propeller shaft.

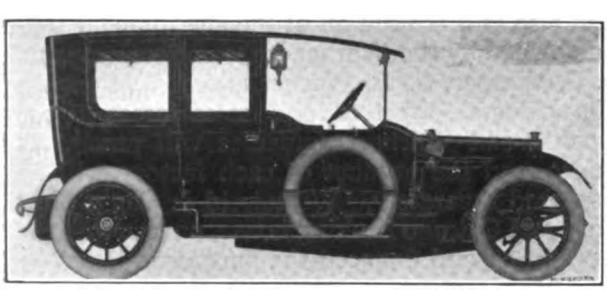
Compact Gearbox and Underswept Cross Member on De Dion-Bouton.

The 12 horsepower chassis is a new design. The engine is with poppet valves totally enclosed, and extra large covers are provided so that it is possible to remove any pair of valves by displacing but one cap. The motor and gearbox are carried together in a very compact unit system, which is attached to the frame by a three point suspension. On top of the crankcase at the rear of the cylinders is a chain driven shaft which may be connected up to a dynamo for supplying

Holbrook Town Coupe on Minerva-Knight.

electric lighting. The rear axle is suspended on semi-elliptic springs shackled at both ends, and the propeller shaft is encased in a tubular torque member which is provided at its forward end with a strong fork attached to a cross member of the frame coincident with the universal joint. Triangulated bracing tubes run from the spring pads to the centre of this torque tube. The universal joint also is of interest, in that it apparently consists of two plates between which a thick rubber disc is bolted.

The Metallurgique is from Belgium. Four models are produced, these being rated at 10-12, 20-30, 20-40 and 26-50 horsepower. All have four-cylinder motors. The 20-40 unit has cylinders cast in pairs, and the valves are all on one side, wholly enclosed. These are operated by a silent chain driven camshaft, at the end of which is a positive vane pump, which delivers oil under high pressure to all working parts. In the main the construction does not differ materially from previous practise. Detachable wire wheels are fitted as standard. Brakes are all of large size, and all are of the internal expanding type, located on the countershaft and rear wheel hubs.

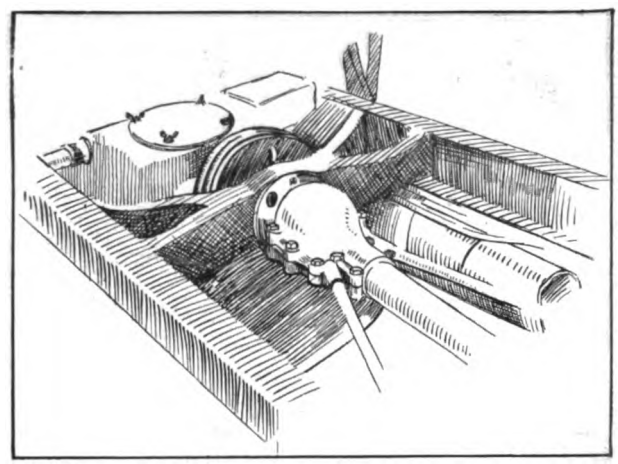


The Renault, still another French car, will be presented in three models, 12-18, 35-45 and 40-60. The two first have four-cylinder motors, and the largest six, cast in triplet. The camshaft

Digitized by Google

is gear driven, all valves being on one side, and enclosed by removable covers. The magneto lies across the engine and is driven from the camshaft. An unusual feature is the clutchshaft entirely enclosed in an aluminum casting projecting forward from the gearbox. The universal joint at the front of the propeller shaft also is enclosed in an aluminum casting, and this with the gearbox and differential may be filled with lubricant through large snap lid filler caps. Renault new detachable wire wheels are fitted as standard.

The Minerva is a Knight engined car from Belgium. All four of its models, 14, 18, 26 and 38 horsepower, are thus fitted. The smallest car is equipped with an overhead worm driven rear axle, but all the others have discarded the worm. Bosch single ignition is employed on the 14 horsepower model, but the dual type is used on the others, and the automatic advance of last year has been replaced by a control lever on the steering column. Dunlop wire wheels are standard equipment.



Two models of the Isotta-Fraschini are produced in Italy, these being the 12-15 and the 27-80. The larger motor is a particularly interesting unit, with the four cylinders cast en bloc, the overhead valves and their mechanism being completely enclosed in a dust and oil proof case,

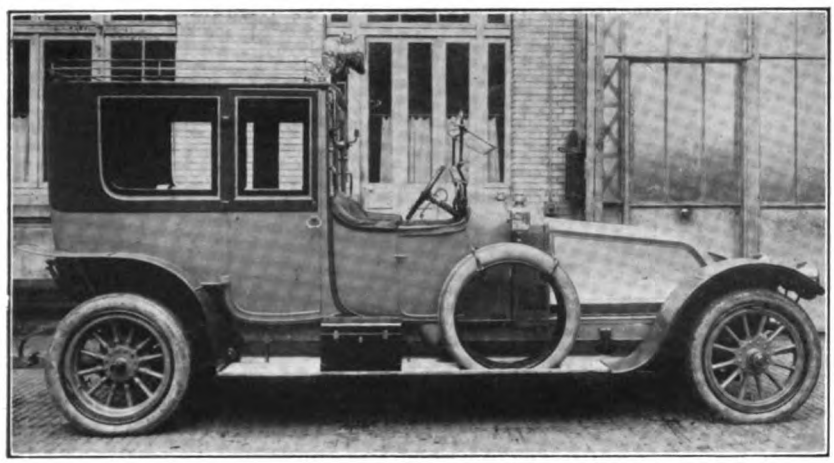
Holbrook Landaulet Limousine on Mercedes.

which is easily detachable. The water pump and magneto are on separate sides of the motor, but are driven by a common transverse shaft. On the larger motor the exhaust manifold has separate leads from each cylinder and resembles the intake manifold in every particular. Outlet pipes for the water circulation system are taken from either side of the engine.

A special feature of the transmission is that both the layshaft and main shaft are provided with bevels. By this means the high is direct, while the indirect gears transmit the power through a single train. On the chain driven models, the chain is protected by water proof casings mounted on the radius rods, making for silent operation.

Spherical Head of Propeller Shaft Casing on Mercedes 1913 Chassis.

The Lancia is another Italian product and is provided in two models, these being rated at 20 and 30 horsepower. The motors are four-cylinder units, cast en bloc. Provision is made for driving a dynamo from a V shaped belt pulley in the rear of the gearbox brake drum. Two special features of Lancia construction are presented in accompanying sketches.



Four models of the Austro-Daimler, which as the name implies is produced in Austria, are presented, these being rated at 16-18, 16-25, 20-30 and 27-80. The largest car has a four-cylinder motor with cylinders cast separately. Two magnetos are set at an angle across the face of the engine and are driven off the vertical shaft running to the overhead camshaft, which is carried in an aluminum case over the top of the motor.

While it is true that foreign chassis are more generally sold in this country without body equipment, an American builder being commissioned to produce an appropriate design upon special order, many of the cars in the salon will have arrived directly from the Olympia show in London, and the Paris Salon. These will present the attractive coachwork of such well known con-

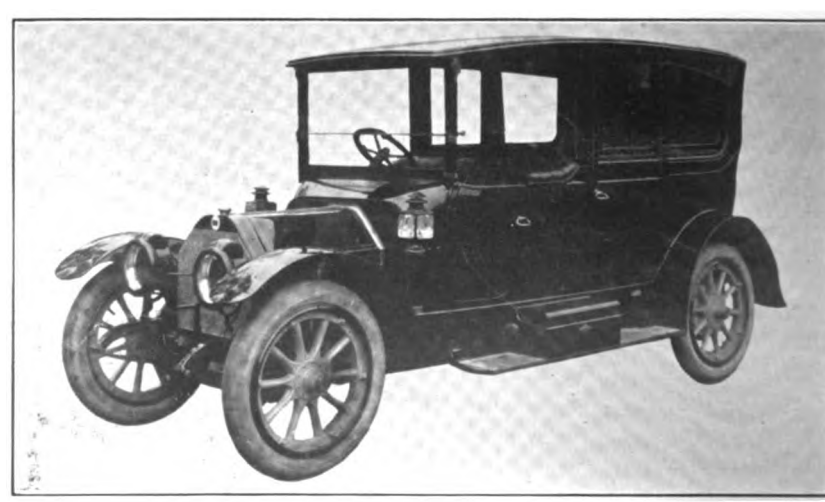
Holbrook Limousine with Carved Oak Interior.

Digitized by Google

Renault Chassis Equipped with Novel Type of Enclosed Body.

structors as Kellner and Mulhbacher of Paris, Van den Plas of Brussels and others.

For instance, one of the Kellner limousines will be shown on a Renault chassis, this being of the torpedo design with double plate glass frameless windows. The interior is in inlaid mahogany, upholstered with new French light cloth. Another Renault will be fitted with a Mulhbacher three-quarter coupe body, seating four forward and one reverse. This will be painted a Vanderbilt brown with black moldings, and will be upholstered in special French Vanderbilt brown cloth.



In addition, several bodies will be presented by American constructors, notably Holbrook & Co. and Lock & Co., of New York City, and Quimby & Co., Newark, N. J. These three firms will make displays of their own, aside from the bodies fitted to cars at the stands of other exhibitors. Several illustrations herewith indicate the latest ideas in body design from the shops of these constructors.

The illustration on the opening page is that of a sporting limousine built for Henry Ford by Holbrook & Co. The driver's seat is an armchair and particularly comfortable. Next to it is a combination seat, facing forward or backward as desired. The interior has no division, and the rear seat is fitted with a disappearing arm rest, which when in use makes two individual seats with arms.

In the six-passenger landaulet limousine shown on a 50 horsepower Mercedes chassis, special attention is called to the low and graceful lines of the body. This type of landaulet, owing to the new method of folding, is held to have very little overhang at the rear and to have an added advantage of as large a quarter light window as those in a limousine. The interior of this car is of inlaid mahogany.

The salon will be opened formally the evening of Jan. 2, when the members of the Importers' Automobile Alliance will be the hosts at a banquet given to a number of prominent people in New York City and elsewhere, including the ambassadors of the five nations represented by cars in the display.

The Stewart-Warner Speedometer Corporation was organized Dec. 19, under the laws of Virginia with a capital of $1,000,000, taking over the entire stock of the Stewart & Clark Manufacturing Company, Chicago, and the Warner Instrument Company, Beloit, Wis. The new concern also will acquire all of the speedometer patents owned by the Warner Instrument Company, A. P. Warner, C. H. Warner and J. K. Stewart. The officers, directors and sales forces of the Stewart and Warner companies will remain as before, and the product of each factory will be marketed separately. Whiteweld & Co., a New York and Chicago banking house, underwrote the proposition and financed the purchase.

An Interesting Limousine Body Fitted to Lancia Chassis.

FEATURES REVEALED AT PARIS SALON.

WHAT is claimed to be the largest exhibition of motor vehicles ever assembled under one roof came to a close in the Grand Palais, Paris, France, Dec. 22. Complete details concerning the 1912 Paris Salon have not as yet reached this side, but although there were 565 separate stands as compared with the 353 of the recent Olympia show in London, England, it is not known how many additional makers made display. It is certain that America was better represented, the following cars being shown: Buick, Case, Century electric, Detroit electric, Flanders (known as the Studebaker here), Ford, Hupmobile, Mitchell, Oakland, Overland, R-C-H and Reo. Other American products were: Vacuum oils, Goodrich tires, Rushmore lamps, Klaxon horns, Oildag, Bowser tanks, and the silent chains for cam and magneto shafts, and elsewhere when at all practicable; single high-tension magneto with fixed advance on smaller models and variable advance on the larger; slight interest in self-starters; increasing popularity of electric lighting; some question as to the advisability of utilizing worm drive, and a continued experimentation with non-poppet valve motors.

In this last connection it is noted that the number of Continental concerns producing Knight engined models has increased by the addition of the Mors, Gregoire, Aries, Rossel and Clement-Bayard. Licenses also have been secured by the N. A. G. in Germany, Johann Puch in Austria, and Martini and Sigma in Switzerland.

Other motors of the non-poppet valve type are being revealed, among which may be mentioned the Peugeot and the Delahaye. Of course, the Darracq is continuing its Darracq-Henroid rotary distributor model; the Rolland Pilain, its single sleeve type; Piccard-Pictet still has its license for the Argyll; Itala has its rotary distributor; Schneider has a ring type applied to one model only; C. I. D., a rotating ring model, and C. L. C., a rotary sleeve design.

Interior of the Grand Palais, Paris, France, During the Progress of the Recent 13th Automobile Salon.

goods manufactured by T. Pilter, Toledo, O., and Potter & Johnston Machine Company, Pawtucket, R. I.

The Grand Palais affords 260,000 square feet of floor space, and as early as July every inch of this had been taken. Two hundred firms who were crowded out made application for an overflow section, but this request was not granted. As a result an independent organization opened a show of this character, Dec. 14, which will be continued until after the first of the year.

From cabled advices it would appear that the features of the Grand Palais exposition might be listed as follows: Increased tendency toward block castings, including the motor and transmission assembly; more compact gearboxes; use of

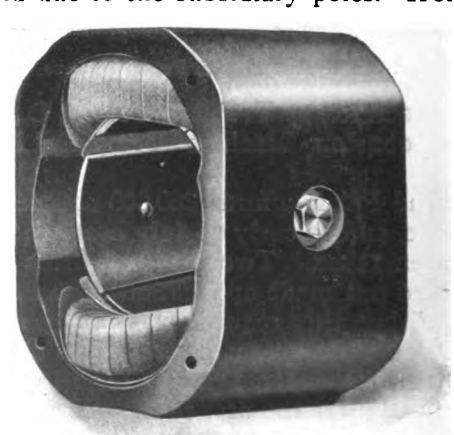
THE C. A. V. ELECTRIC LIGHTING SYSTEM.

Features of a Leading Foreign Equipment Which Differs Radically from American Practise---Cut-Outs and Regulators Are Eliminated, a Free Wheel Device Being Incorporated Instead--Its Construction and Operation.

ALTHOUGH the subject of lighting the motor car by electricity as disclosed by the various American systems has been treated fully in these columns, The Automobile Journal, through the courtesy of C. A. Vandervell & Co., electrical engineer of London, England, is able to present to its readers one of the leading European lighting systems. It will be of particular interest in that it differs radically from conventional American practise and because it is standard equipment on at least one make of car to be exhibited at the Importers' Salon, New York City, next month.

C. A. V. Variable Speed Dynamo, Having but One Moving Part and Utilizing an Ingenious Free Wheel Device Instead of Cut-Outs or Electric Regulation.



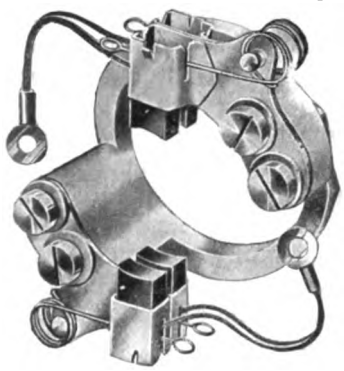
It is conceded that the most important factor in the utilization of a dynamo for motor car lighting is the device for compensating the variable speed of the motor, because the pressure or voltage varies with the speed of the armature. Briefly speaking the automatic controls may be defined as: Mechanical, such as a centrifugal governor or a slipping clutch; electro-mechanical, or pure electrical, counter electromotive force being introduced into the field circuits.

With the C. A. V. system, manufactured by C. A. Vandervell & Co., Warple Way, Acton Vale, London, England, which concern advocated electricity for lighting automobiles as early as 1900, and placed its variable speed dynamo in the market in 1904, cut-outs and regulators are eliminated. The output of the dynamo is held at a proper value by an ingenious use of magnetic actions and reactions which occur between the armature and the field magnets, and it is maintained that the output is kept absolutely constant at all speeds of the car.

In the C. A. V. dynamo there are two ordinary poles and two subsidiary poles. The latter are excited by the windings which are supplied with current from the working mains. The magnetic flux excited by these windings passes, when not distorted, diametrically through the armature from one subsidiary pole to the other subsidiary member and, dividing right and left, finds return paths through the frame of the dynamo.

The two ordinary poles have no winding upon them of any kind. Magnetism is excited in them by the reaction of the armature, not that of the whole armature, however, but the reaction due to the currents generated in certain short circuited coils; namely, the coils which are for the time short circuited by the brushes that are collecting the current at the commutator.

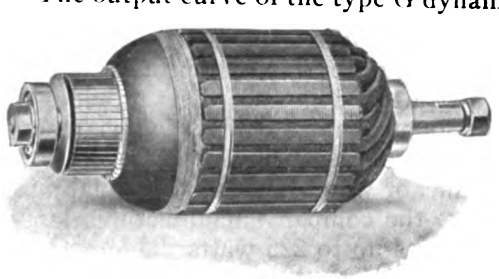
The operation of the dynamo is as follows: The brushes being set in the usual neutral position with respect to the ordinary poles, the coils which they short circuit in the act of commutation are those which for the time being are not in any neutral magnetic zone, as would be true of an ordinary dynamo, but are in the active zone where they are cutting the magnetic lines of the field due to the subsidiary poles. Hence, during the period of short circuit, they will be the seat of short circuit currents. These currents cross-magnetize the armature and tend to set up a magnetic flux at right angles to the flux of the subsidiary poles, and this cross-magnetizing effect



Magnet and Field Coils of C. A. V. Dynamo.

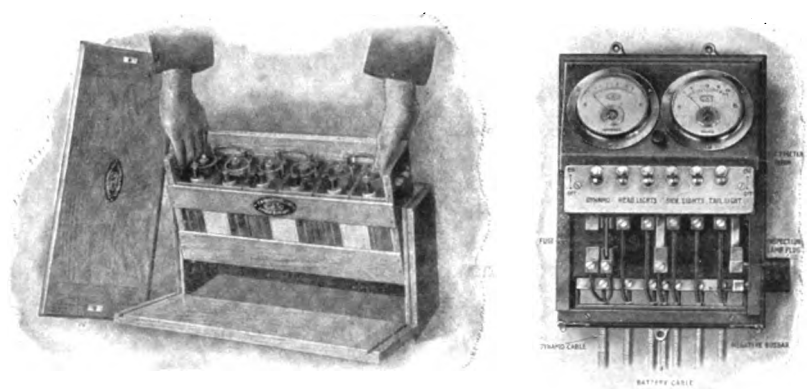
Digitized by Google

is held to be greatly augmented by the presence of unwound ordinary poles.



The result is that the previously existing flux is distorted, and instead of traversing the armature diametrically from one subsidiary pole to the other, now turns aside, passing only quadrantally through the armature, and breaking up into two quadrantal paths, each of which includes only one quadrant of the frame. This change from the directly transverse flux to the quadrantal flux is accomplished gradually as the speed of revolution begins to increase.

C. A. V. Brush Gear.

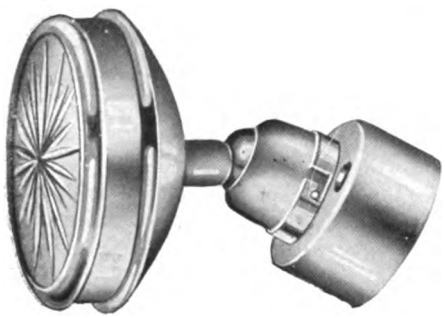


But at this point another action begins, for in addition to such short circuited currents, which are confined to a few coils, all of the windings of the armature are now generating the working current which the brushes are collecting and sending to the battery or lamps. This working current in the windings of the whole armature exercises a magnetizing reaction which tends to directly oppose the magnetism of the subsidiary poles, and thus reduce the initial flux. Since these demagnetizing reactions increase with the speed, they will counteract the tendency of the generated electromotive force to rise as the speed increases, so that the output remains constant.

The output curve of the type G dynamo is presented in an accompanying illustration, and it will be noted that the generator begins to charge the battery at 500 revolutions a minute; that at 600 revolutions five amperes is developed, and that the maximum output of 10 amperes is reached at 1150, this being held constant at speeds as high as 4000 a minute. This design of dynamo is for service on large cars and runs at about 1.5 times engine speed.

Showing Armature and Commutator of C. A. V. Dynamo.

The company manufactures six types, D and D 8 being intended for small cars, and having an output of six amperes at 550 and 600 revolutions a minute, respectively. They attain the maximum output at 1500 revolutions. Type E is suitable for the average touring car, commences to charge the battery at 500 revolutions a minute and is designed to operate at double or 1.5 engine speeds, the latter ratio being for high speed motors. The maximum output is six amperes, attained at 1500 revolutions a minute. Type E S begins charging the battery at 400 revolutions, has an output of seven amperes and attains its maximum at 1150 revolutions. This is designed for cars where a lower "cutting-in" speed is a convenience and when the size of the driving pulley must be limited. Type F develops 6.5 amperes, commences to charge at 290 revolutions a minute and attains its maximum at 800 revolutions. It is for cars where the installation requires a direct drive. Type H is for public service vehicles, where a reversible dynamo is sometimes essential, and a cut-out is employed instead of the free wheel device. It commences charging at 650 revolutions a minute and the maximum current is 15 amperes at all speeds above 1400 revolutions.

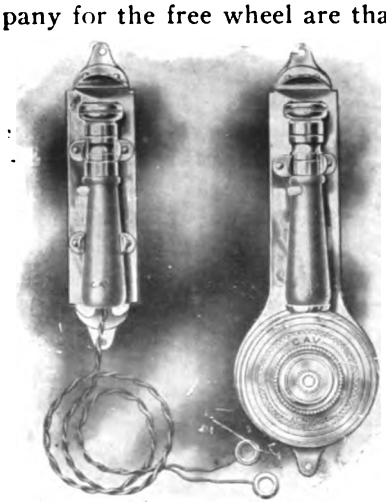


Showing 12-Volt Battery with Inner Crate Removable from Top or Front and Switchboard with Front Displaced to Show Connections, Etc.

The dimensions of the different types will be of interest. Those of D and D 8 are 8.5 inches long, including the extension of the armature shaft, 6.125 high and 5.25 wide. Types E, E S and F are 9.625 inches long, 6.125 high and 5.25 wide. Type G is 10 inches long, 6.75 high and 5.875 wide. Suitable dynamo brackets are provided according to the requirement of installation.

The C. A. V. dynamo differs principally in

Digitized by Google



that no automatic cut-out is incorporated for disconnecting or cutting in the generator when the output of the latter is below that of the cells or at a proper charging value. A free wheel device is utilized, the company maintaining that electrical cut-outs are too delicate to withstand vibration, and that as the C. A. V. dynamo begins to charge at a very low speed, they are not necessary.

Swivelling, Adjustable Interior Lamp.

The free wheel is incorporated between the armature spindle and the pulley, so that when the motor is stopped, or run too slowly for the dynamo to charge the battery, the armature can revolve freely or "motorize," thus overrunning the driving pulley. It is held that owing to the design of the machine, only an exceptionally small amount of current is taken from the battery, and that the free wheel device makes it impossible for an excessive current to be discharged from the cells through the dynamo. Because of the extremely low speed at which the dynamo generates, the free wheel only comes into action when the engine is actually stopped.

Some of the advantages claimed by the company for the free wheel are that there are no extra contacts to get out of order and that the dynamo charges immediately as the voltage rises above that of the battery. With a cut-out the dynamo voltage rises considerably before it cuts in, and relies on a reverse current and a spring to cut out. It is also held that allowing the dynamo to take current from the battery at any time is not wasteful, and that with the free wheel device the consumption of current is infinitesmal and occurs only for a few moments occasionally, whereas an ordinary cut-out is taking current through its shunt and series coils all of the time.

Spring Drum Controlled Cigar Lighters Keep Cord Out of Sight.

A switch is provided for disconnecting the dynamo from the cells when the motor is inoperative and should it accidentally be left on, the buzzing of the free wheel is sufficiently audible to attract the driver's attention. The maker holds that while the switch is manually operated, this has a decided value in that the generator may be cut out when the cells are fully charged. A voltmeter and ammeter mounted upon the switchboard enable the operator to note the conditions of the cells and the operation of the system. Should the driver forget to switch off the dynamo when leaving the car it is stated that no harm would result as it would require 22 hours to exhaust the battery.

Inspection Lamp, Interior Corner Light and One-Way Interior Switch.

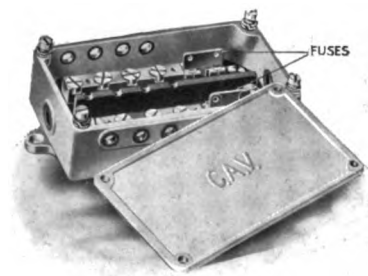
The maximum current developed is less than the lamp load, but it is held that there is ample margin. The average set of lamps, including two head, two side and a tail light, consumes about 6.5 amperes. Taking the output of the battery for example, 44 hours, it would supply the lamps for several hours without the dynamo, which in average running, generates at least five amperes, or six on a straightaway run. This provides for about 20 hours of lighting with all lamps in service. For machines which are operated but little in the daytime, or which have an abnormal number of lamps, the company manufactures larger sizes of dynamos up to 225 watts.

Another reason advanced by the company is that if a 12-volt battery were being charged, its voltage would rise in a very short time to 13.5, or 12.5 per cent. With metal filament lamps this increase in voltage means a 50 per cent. increase in light; that is to say, a lamp which at 12 volts

Digitized by Google

gives 32 candlepower rises to 48. It is pointed out that if the lamp is working at its correct efficiency at the beginning, this brings it to a temperature very near the melting point of tungsten and invites breakage. Twelve-volt batteries are utilized with all dynamos except types D and D S, which employ six-volt members. The capacities range from 33 ampere-hours for the smallest to 110, being 33, 44, 55, 66 and 110.

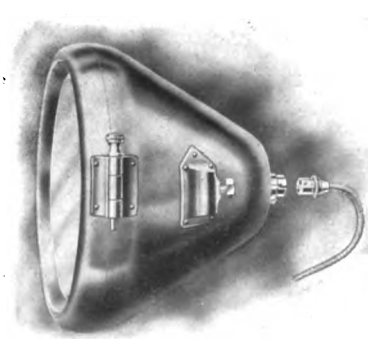
As will be noted by an accompanying illustration the 12-volt members are carried in an inner crate, removable from the top or front, and the design of the case makes for accessibility. The cases are of plain teak for painting to match the finish of the car or with polished surfaces. Celluloid jars are standard, although the company recommends flexible ebonite for service in tropical countries. The running board of the machine is recommended as the point for installation.



C. A. V. Illuminated Mirror.

In the matter of the dynamo location a position under the hood is favored, the drive being taken from the camshaft as shown in an accompanying illustration. Some machines, however, do not permit of this method and the majority utilize the clutch shaft as depicted elsewhere. In some cases the cardan shaft is employed, but this is not recommended, owing to the vertical movement experienced when the car is traversing rough roads.

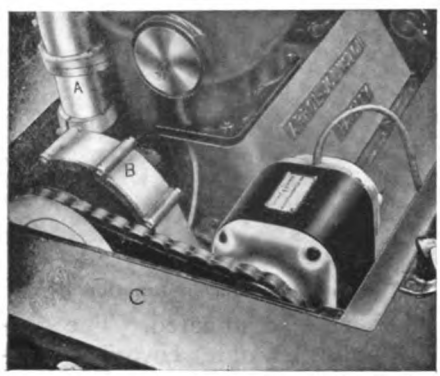
Drive is by a special V belt which comprises a combination of leather and steel links, the latter being placed between the leather members. Half-links are provided for adjusting the tension and an extra member is supplied with each equipment. The transmission members are V pulleys and a large number are constructed to meet the requirements of installation and to obtain the proper driving ratios. Some are designed for clamping to a flat fan pulley, while others are fitted over the shafts. Split pulleys are utilized for clutch shaft drives, a design facilitating attachment, obviating as it does the removal of the shaft.



Qualities emphasized of the C. A. V. equipment are the wiring and method of installation. A patented flexible armored cable is employed, being attached by special clips, and a special form of insulation is used in which rubber is eliminated. The conductors are protected by an outer covering of armor, consisting of a single wire of special section wound spirally instead of braided. It is held by the maker that it has no tendency to unwind, even if cut, and that a drop of solder will retain it permanently in position. It was designed with an object to eliminating soldered joints and its advantage is shown in the accompanying wiring diagram. An aluminum junction box is fitted only when interior lights and electric horn are included in the equipment.

C. A. V. Chassis Junction Box.

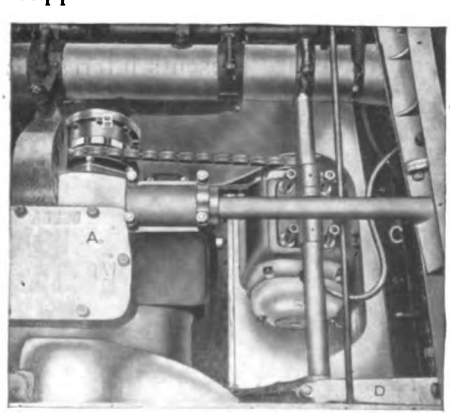
The bulbs utilized with the C. A. V. system are specially manufactured and being designed for the C. A. V. lamps great efficiency is claimed. The candlepower of the headlights varies from 12 on small cars to 48 on large machines, the latter equipment being for service where a very powerful headlight is desired. Tail lights are equipped with one candlepower bulbs, while from three to nine candlepower members are used in the side lamps, according to individual taste. Cases are provided for carrying spare bulbs and four sizes are made.



The C. A. V switchboard presents interesting features and the control of the lamps differs from conventional American practise in that separate switches are provided for the right and left headlights and side lamps. Single members are used for the dynamo and tail light and in one type of board a mechanical charge indicator is utilized in place of the ammeter, also a

C. A. V. Cone Headlight.

Digitized by Google



switch arm on the outside for the lamps. The design also includes a half-output switch and a dynamo emergency member located inside the board.

Showing Dynamo Driven from Camshaft, an Installation Making for Accessibility.

One of the qualities of the board, many features of which are patented, is the accessibility of every conductor and terminal, these being visible by raising the hinged front. A fuse of the spring clip pattern is placed in the dynamo field circuit to guard against any possible damage to the generator in the event of it being run accidentally when the battery is disconnected. A spare fuse is placed within each board for emergency.

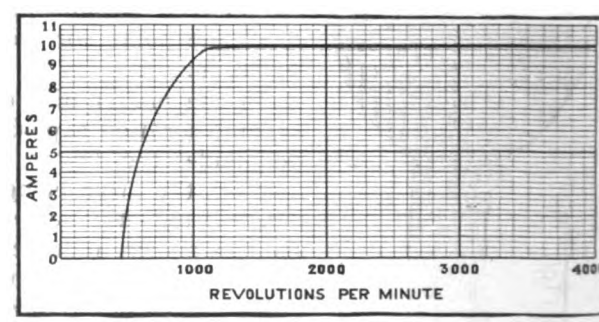
The C. A. V. switches are noticeable for their compactness and neat design, especially those utilized for interior work. Those fitted to the switchboard are of the tumbler pattern, as are several other types, and some idea of their compactness may be ascertained when it is known that one is but 1.25 inches in diameter and one inch deep. The C. A. V. patented switch is simple and is equipped with a device for locking the lever in either position. All interior switches are supplied finished in colors to match the interior fittings.

Drive May Be Taken from Clutchshaft, the Dynamo Being Supported by a Bracket.

The lamp equipment is manufactured in the company's special factory and the headlight design is the result of experimentation extending over a period of several years. The reflecting qualities are such that the entire road is illuminated and each design is equipped with a focussing device of simple construction. The reflectors are made from a high grade alloy coated with pure silver, and burnished by a special process. It is held that the optically true surface will last for years if polished only with the cloths supplied. Glass reflectors are fitted if desired.

It is interesting to note that attention is paid to the elimination of the dazzling effect and the certificate of performance under the open competition conducted by the Royal Automobile Club of Great Britain showed that the C. A. V. lamps were free from dazzling at a distance of nine feet from the light. By this is meant that an observer facing the car nine feet away could distinguish objects placed six feet to the side of the machine and six feet beyond at an eye level of four feet, six inches.

The candlepower of the naked light was 33, consuming 22.3 watts at a pressure of 12.4 volts. The diameter of the front aperture of the lamp was 7.875 inches and the height from the ground was 2.8 inches. The range at which the lamp



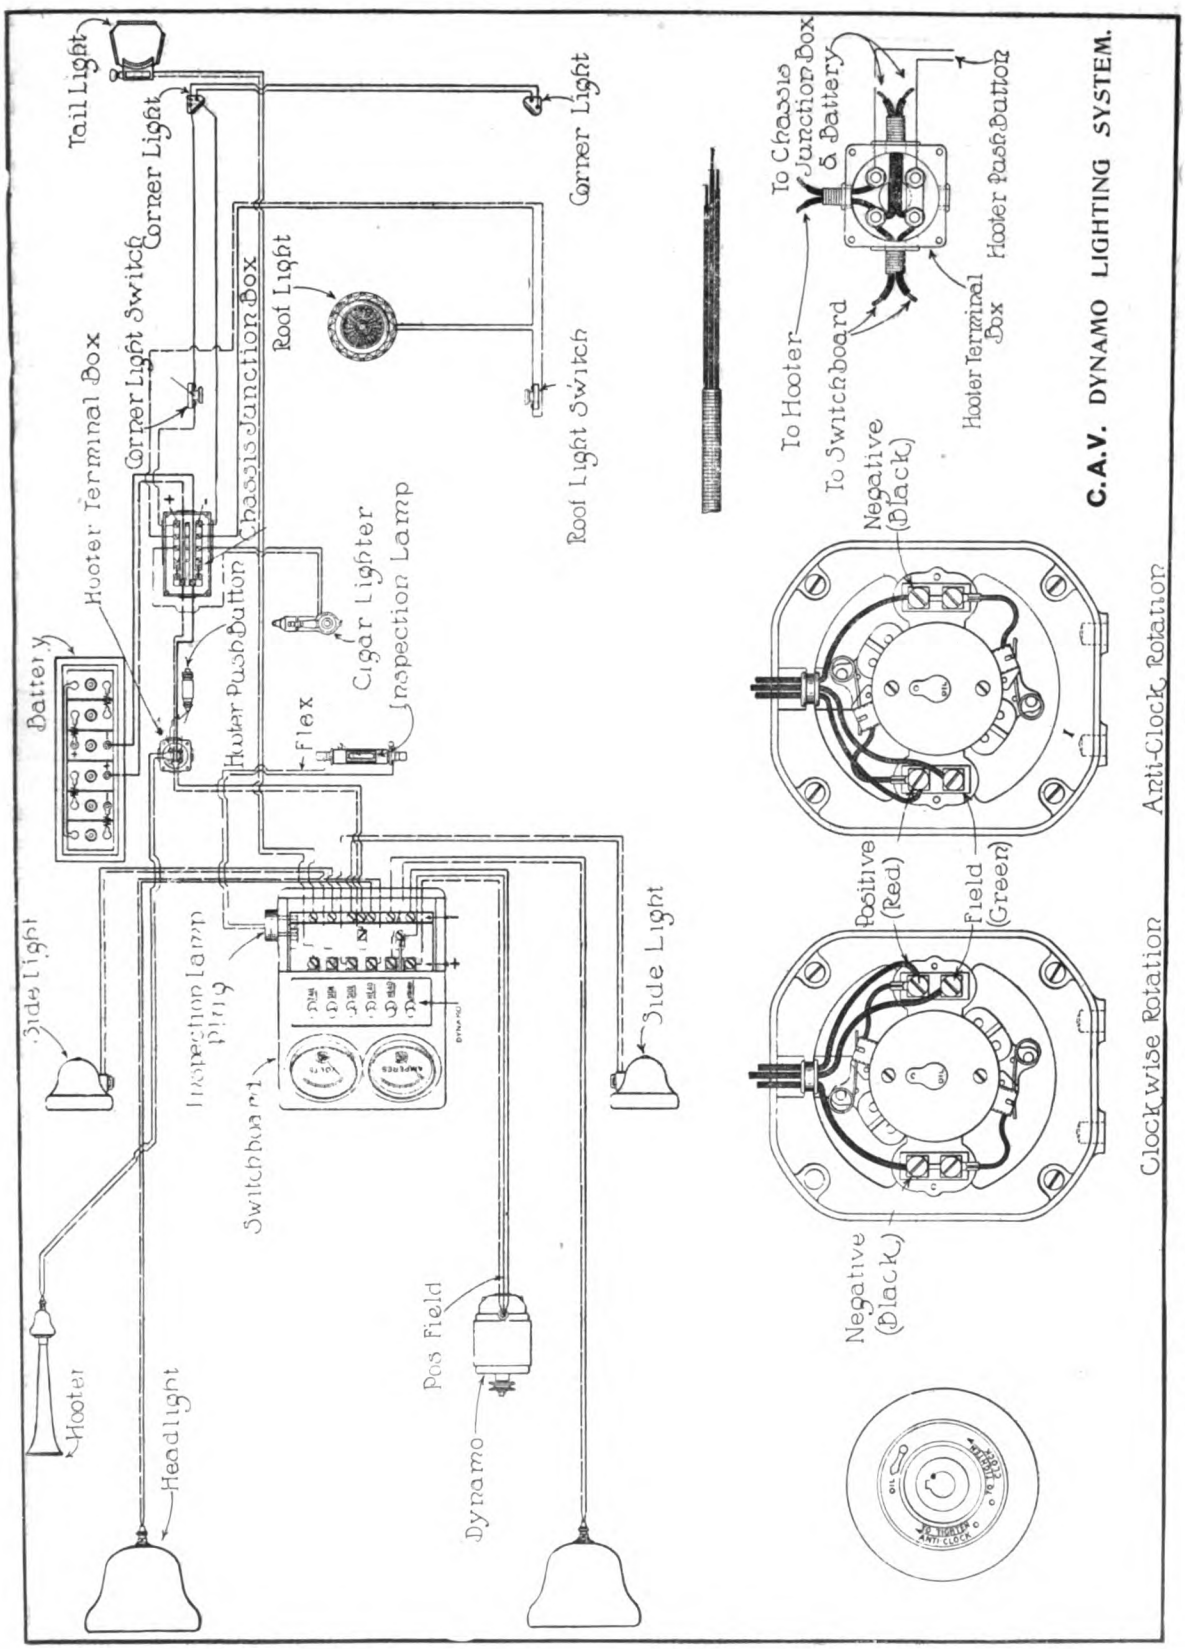


Chart Showing Output of Dynamo for Charging 12-Volt Battery.

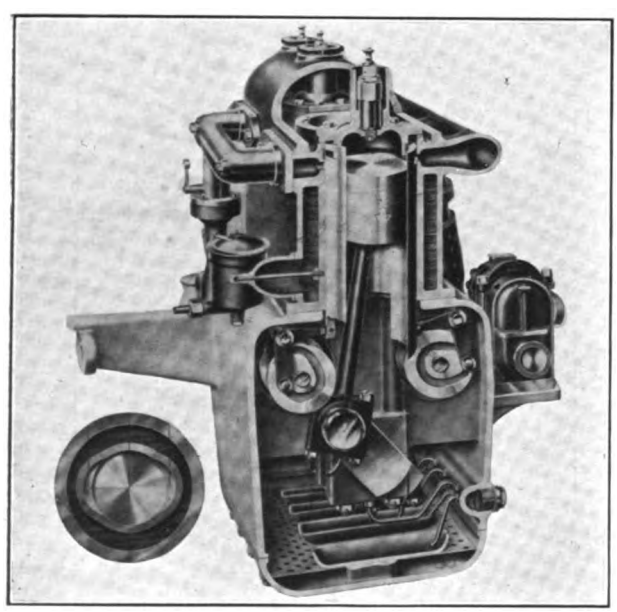
gave a certain standard illumination (one-tenth of a candle-foot), measuring down a line along which the beam of light was centred, was 160.5 feet. The width of the beam, measured at half the above distance, was 80.25 feet. At a level of three feet it was 20 feet, three inches, and at the eye level, four feet, six inches, it was 20 feet, 10 inches.

The C. A. V. lamps are rich in design, especially the interior members, some of which are depicted in accompanying illustrations. Among those not shown and deserving special mention are the dashboard inspection lights, these being adjustable to position and fitted with revolving shutters. Another type is for attachment to the steering column, is provided with a universal joint and may be removed easily and utilized as an inspection lamp if desired. The tail lamp is equipped with a spot light throwing a beam to one side and enabling the driver to note if the bulb is working properly. The finish of the lamps

Digitized by Google

Wiring Plan of C. A. V. Lighting System, Showing Connections When Operated Clockwise and Anti-Clockwise.

Digitized by Google



is in keeping with the high grade material and workmanship.

The C. A. V. lighting system is fitted to the cars of royalty, including those of the King of England, the Emperor of Japan, the Czar of Russia, King of Spain and several other notable personages. It is stated that over 10,000 lighting oufits were in service at the first of November.

DETROIT ENGINEERS TEST M. A. G. I. C. MOTOR.

AT A RECENT meeting of the Detroit section of the Society of Automobile Engineers, Lewis Brown, assisted by George Ratcliffe, read an interesting paper upon a new motor designed by Martin Fischer of Zurich, Switzerland. The engine in question is known as the M. A. G. I. C., a composite of the initial letters in the name of the company which controls the rights in this country, the Motor and Gear Improvement Company, 250 West 54th street, New York City. Lewis B. Brown is president and Dwight Partridge, treasurer.

The motor is conventional in that it is a four-

Sectional View of M. A. G. I. C. Motor Utilizing Slides Operated by Box Cams.

cylinder, four-cycle unit with the cylinders cast en bloc. The bore is 3.3125 inches and the stroke 4.75. A thermo-syphon cooling system is employed; ignition is by a high-tension magneto, and lubrication is by a combination splash and force feed.

Interesting features of the construction, which differ from conventional practise, are the sleeve valve mechanism and the small clearance volume. By reference to the vertical sectional illustration it will be seen that the cylinders have semi-spherical shaped heads with cylindrical extensions passing through the water jacket into which the spark plugs are fitted. This provides efficient means of introducing the flame in the centre of the combustion chamber as well as makes for convenience in attaching the water jacket cover.

The cylinder is provided with two crescent shaped sleeves or slide members, forming a part of the cylinder wall, and each occupies about 69 degrees of the circumference. These slide members are mounted on opposite sides of the cylinder, one for the exhaust and the other for the intake. They are constructed of cast iron and extend the entire length of the cylinder and about two inches below.

At the bottom of each slide is a slot for engagement with the actuating mechanism, this comprising a form of box cams, the shafts of which are rotated by silent chains from the crankshaft. As will be noted by the illustration the movement is imparted by suitable bell cranks, and one of the qualities claimed of the construction is silent action. It also is pointed out that the movement of the cams is positive in both directions, that a dwell is obtained after the closing of the ports and that the slides are at rest during the compression and firing strokes.

The ports are located at the top of the slides, being rectangular in shape, and are of the same size as those with which they register in the cylinder walls. The travel of the slides is one inch for the complete cycle, while the height of the ports is .375 inch, giving a lap of .125 inch. In the illustration the exhaust port is registering with that of the cylinder wall while the intake is closed.

The cylinder heads are removable, having the conventional flange construction for bolting to the cylinder. In addition to the cylindrical extensions referred to, there are also extensions which project downward into the cylinders, these acting as "bull rings" or guides for the valve slides and being intended to hold the latter on their seats. Cored passages connect the cylinder ports to flanged openings to which the inlet and exhaust manifolds are attached.

It is stated that the motor has been tested out on the road and has completed an actual mile-

Digitized by Google

age of over 11,000. It also has undergone exacting dynamometer tests, data having been obtained through Howard Coffin and his associates in the experimental laboratories of the Hudson Motor Car Company, Detroit. It is claimed that after 11,000 miles of service no wear had taken place on either slide of the valve mechanism.

In his paper Mr. Brown said: "Perhaps the most interesting fact is that the clearance is about 18 per cent. of the total cylinder volume, giving a compression which is higher than in general practise. It would seem that this high compression would cause spontaneous combustion, and while we have certain reasons of our own to account for the fact that this does not take place, it is hoped that a discussion on this point will either confirm our reasoning or evolve others. It is relevant to state that during the several months the engine was under our observation there was no instance of spontaneous combustion or of overheating. Another feature which must have a marked effect on the thermal efficiency is the small surfaces exposed to the combustion temperature. It will be noticed that with the exception of the bull ring, every bit of metal is in proximity to the cooling water.

"Reference to the brake horsepower curve shows that the power increases steadily up to 2000 revolutions a minute and that it is in direct proportion to the speed up to 1500 revolutions a minute. You are familiar with the characteristics of brake horsepower curves of the poppet valve type and will perhaps be interested in comparing these with the curve of the Fischer motor. Comparison with the M. E. P. curve will also be interesting and it will be noted that the peak in the curve shown is reached at 1400 revolutions a minute and that it is in excess of 105 pounds throughout the entire range of speed."

The same paper was read by Mr. Brown at the Indianapolis section of the S. A. E., and the discussion following the meeting at Detroit will be continued in March.

ROCHESTER'S AUTOMOBILE SHOW.

Three Buildings Will Be at the Disposal of the Local Dealers This Year.

Seventy-eight thousand square feet of floor space in three buildings at Exposition park will be placed at the disposal of the dealers in Rochester, N. Y., for their annual show, Jan. 27-Feb. 1. Entrance will be through building No. 3, and the visitors will be compelled to walk the entire length of the accessory hall before reaching the automobile display, so that the accessory men will be assured of a splendid attendance.

Last year's decorative scheme was conceded to be one of the best in the country, but this will be exceeded this year. The event is under the management of the executive committee of the Rochester Automobile Dealers' Association, as follows: President F. W. Peck, Vice President C. E. Hartson, Treasurer F. R. Luescher, Secretary George J. Bauer, H. P. Gould, A. V. Hart, A. M. Zimbrich, A. R. McKenney, C. E. Sager, H. G. Strong, Robert Thomson, Arthur McNall and Paul LeHardy.

HUDSON SAVES HIS LIFE.

Long Tour in Open Air Brings Renewed Health to New York Man.

F. W. Potter, well known manufacturer of shoe materials, who was given up by physicians a year ago, has just returned to his home at New York City in robust, vigorous health as the result of a double transcontinental motor trip covering 15,000 miles in a two-seated Hudson roadster, made by the Hudson Motor Car Company, Detroit. Mr. Potter's health was broken down by overwork and believing that doctors were right he started out to have as much pleasure as possible in the remaining time he thought he had to live.

He was agreeably surprised to find that his continued life in the open air tended to build him up and he continued to improve until his return home. The Hudson car made the long journey without difficulty and finished in excellent condition.

NEW R-C-H MANAGER.

Reported That P. R. Janney Will Soon Succeed J. F. Hartz in This Position.

According to report, Payton R. Janney will become general manager of the R-C-H Corporation Jan. 1, succeeding J. F. Hartz, who has been treasurer and acting general manager of the concern for the past two months. Mr. Hartz will continue as treasurer of the firm.

Mr. Janney formerly was general manager of the Peninsular Motor Company, Saginaw, Mich., maker of the Marquette cars. He is well versed in automobile conditions, both in the production and sales departments.

ALLIANCE OF ELECTRICAL CONCERNS.

Western Electric Company Becomes United with Pittsfield Spark Coil Company.

An alliance between the Western Electric Company, New York City, and the Pittsfield Spark Coil Company, Dalton, Mass., about which rumors have been in circulation for some time, has been confirmed by both firms. It has been expected that since the enormous increase in the use of electrical apparatus with gasoline automobiles one of the big electrical companies would take up this branch of the business. The Western Electrical Company is one of the biggest companies in the United States, doing $70,000,000 business a year, and the new alliance places it back of a line of ignition devices having a reputation for high quality such as the Pittsfield products have always enjoyed. The large engineering force of the Western company will work in conjunction with the Pittsfield engineers in developing new apparatus.

Under the arrangement between the two companies the entire line of Pittsfield products including magnetos, spark coils, spark plugs, timers and switches are now to be marketed exclusively by the Western Electric Company, under the name of Western Electric-Pittsfield. For a time the Pittsfield company will continue to market some magnetos direct. The sales efforts of the Western Electric Company will be directed largely towards manufacturers and supply houses. Ample stocks will be carried at each of the 28 Western Electric distributing houses located at shipping centres throughout the country. This brings the Western Electric-Pittsfield products within over-night shipment of every automobile manufacturer, dealer and owner. It is understood that beginning Jan. 1 a sales campaign will be launched covering the entire line of devices which has been materially extended to take care of the allied business.

UTAH DEALERS COMBINE.

Unite in Effort to Solve Second Hand Car and Other Problems.

The Utah Automobile Trades Association is the name of a new association of automobile, tire and accessory dealers which has been organized at Salt Lake City to protect its members from some of the evils which have grown up in the trade. The new body has opened an office at 251 State street, Salt Lake City, with a manager in charge. The question of credits will be handled through a credit bureau within constant telephonic communication with its members.

The second hand car situation, which is attracting attention throughout the country, will also be handled by dealers in this manner. When an offer is made on a second hand car by any member of the association this offer is immediately telephoned to the central office. Such information is confidential, but in case the person wishing to dispose of his car goes to another dealer, such dealer can find out by telephone just how much has been offered on this particular car, although the name of his competitor is not given. In this manner dealers are at all times protected from persons who go from one to another, getting them to bid against each other by inflating the price which has been offered.

Other important problems will also be handled in a manner of benefit to the members.

Digitized by Google

The new association is composed of all the large concerns in the state and nearly all the smaller ones as well.

ENTERS ADVERTISING FIELD.

Gleeson Murphy Leaves General Motors Company Under Particularly Favorable Auspices.

Gleeson Murphy, who for the last two years has been assistant to President Neal of General Motors Company, has opened a branch at Detroit for the H. K. McCann Company of New York, one of the strongest and best known advertising agencies in the United States. Mr. Murphy, who is a student of big organizations, leaves the General Motors Company with the asset of having materially assisted in the reorganization of that company and his present purpose is to establish a complete advertising agency in Detroit, backed by the best experts in the merchandising line.

The McCann company is composed of general advertising experts of national reputation, including H. K. McCann, former advertising manager of the Standard Oil Company; Herbert W. Casson, well known writer, orator and efficiency expert; Thomas Nast, president of Nast Art School; Gerald B. Wadsworth, author of "Principles and Practises of Advertising;" R. M. St. Hill, A. E. Foot and H. Atwood.

Mr. Murphy, besides having the advice of these men, will be assisted by a local corps of experienced writers and artists. He begins his new enterprise with a high degree of fitness for his work, his experience in handling large sales problems being a strong asset. The offices of the company will be located in the Boyer building, Detroit.

LOCATES IN WASHINGTON.

South Dakota Concern Will Manufacture and Operate Trucks in District of Columbia.

The American Motor Traffic Company, incorporated under the laws of South Dakota, was formally organized at Washington, D. C., Dec. 18, where it will occupy the fourth floor of the new Citizens' Bank building at 1421 G street. The directors of the company are: President, E. S. Alvord, president of the Littlefield & Alvord Express Company; first vice president and acting manager, S. J. MacFarren, manager of the Engineer Searching Company; second vice president, W. J. Moore, president of the Moore Company; secretary, A. L. Kley of New York City; directors, the above and J. C. Muncaster of Washington and J. C. Menocher of Pittsburg.

The company will specialize in heavy duty commercial motor vehicles of the pivoted spindle, multi-wheel drive and steer type, with flexible load suspension and balance, also in liquid fuel combustion engines and vehicle accessories. Many other claims for improvement in vehicle construction are controlled by the company under patents granted to MacFarren, Thomas and others, and further protected by special trade marks. The concern is empowered to operate, as well as manufacture, motor vehicles for all uses and proposes to establish freight, express and passenger services in response to demand, through its exclusive state agencies or auxiliary companies.

NEEDS MORE ROOM.

Myers Becomes Swinehart's General Manager and Concern Will Build New Plant.

Clifford B. Myers has been chosen general manager of the Swinehart Tire & Rubber Company, Akron, O., maker of Swinehart tires, to succeed W. W. Wuchter, president of the company, who has for some time acted as general manager. The change is an initial move towards enlarging the plant and expanding the business generally.

According to the present plans it is probable that in the near future the company will build a much larger factory than it now occupies. The site has not been selected, but as the present plant is in the heart of the city with no vacant space in proximity, property probably will be purchased in the suburbs and eventually the old building will be sold.

ADDS ANOTHER NEW PLANT.

Willard Storage Battery Company Now Has Four Separate and Distinct Factories.

The Willard Storage Battery Company, Cleveland, O., maker of LBA batteries, recently purchased property adjoining its plant No. 1, affording 50,000 feet of additional manufacturing space. Since that time the company also has acquired the plant adjoining this, a building of brick and steel construction with 32,500 feet of floor space.

This will furnish the Willard Storage Battery

Digitized by Google

Company with four separate and distinct plants, all conveniently located close together, but not connected. Three are individually equipped for the manufacture of storage batteries and the most recent purchase is intended for future expansion. It will be used for storage purposes only, for the present, or until such time as the rapidly increasing business warrants other plans.

WITH STEINBOCK CONCERN.

Gormully Resigns as General Purchasing Agent of United States Motor Company.

A. R. Gormully, for four years purchasing agent for the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., and since its formation general purchasing agent for the United States Motor Company, has resigned to become treasurer of the Steinbock Engineering Company, New York City, maker of engines for automobiles, motor boats, aeroplanes, etc. He expects to reconnect more directly with the motor car industry in the near future, however.

A. R. Gormully, Treasurer, Steinbock Engineering Company.

Mr. Gormully was born and educated in London, England, and came to Boston in May, 1892. He began active business life with the Gormully & Jeffrey Manufacturing Company, Chicago, as an office boy, and arose to become manager of the export department before leaving this concern in 1900. The next two years were spent with the Electric Vehicle Company in its first plant in New York City as superintendent's assistant. From 1902 to 1904 he was assistant manager of the Erie Basin Works, maker of general machinery, and in 1905 he went with the Vehicle Equipment Company, Long Island City, as purchasing agent. His connection with the Maxwell and United States Motor companies followed.

TWO LEAVE ABBOTT COMPANY.

Report That Spitzley and Bush Have Resigned Causes Much Surprise.

B. C. Spitzley, assistant general manager, and W. T. Bush, general sales manager of the Abbott Motor Company, maker of Abbott-Detroit cars, have been reported as having resigned their positions. No reasons were given for the action and neither man would make any comment upon the matter, while the officials of the Abbott company were equally as reticent.

It was stated that nothing would be given out by the company until a later date. Both men have been connected with the concern for a long time and the report came as a distinct surprise to the trade. Mr. Spitzley recently returned from a business trip of two months through the West, at which time he reported trade conditions as exceptionally good.

TO BUILD NEW FACTORY.

Guide Motor Lamp Company Has Outgrown Its Present Quarters in Cleveland.

As an evidence of the permanent popularity of electric lighting for automobiles it is only necessary to point to the steady increase in business which has been enjoyed by the makers of such equipment during the past year. The Guide Motor Lamp Company, Cleveland, O., is another concern which has outgrown its present factory and facilities for production.

This company is erecting and will soon move into a strictly modern factory building occupying the entire block between 114th and 115th streets, on Madison avenue in that city. It will afford 14,000 square feet of floor space and will be equipped with the latest improved machinery for the manufacture of Guide electric lamps.

RECEIVER IS APPOINTED.

Creditors for the Flanders Manufacturing Company Consent to This Plan.

Owing to the refusal of certain creditors to act with the committee which assumed charge of the affairs of the Flanders Manufacturing Company, Pontiac, Mich., maker of Flanders electrics, etc., a few weeks ago, the Detroit Trust Company was named as receiver by Judge Tuttle of the United States district court, bond be-

Digitized by Google

ing fixed at $50,000. The dissatisfied creditors attempted to have the firm declared bankrupt, but the directors prevailed upon them to consent to the receivership.

It was pointed out that the assets of the company were greatly excess of the liabilities and that the difficulties were merely through a lack of ready working capital. A statement has been sent out by the creditors' committee that the company will be operated until such time as an inventory can be made, when it will be definitely decided whether to liquidate or continue operations. The business will be continued if the refinancing and production plans are agreeable to the receivers, it is stated.

UNITED STATES MOTOR COMPANY.

Plans for Reorganization Expected to Be Carried Through with Success.

While definite details regarding the reorganization of the United States Motor Company must await the court's action with respect to the sale of the present company's holdings, which has been set for Jan. 8, it is understood that there is every indication that the plans will meet with success.

A number of stockholders, the total reaching nearly 50,000 shares, are said to have failed to accept the proposition to subscribe $24 a share in the reorganization scheme, but it is announced in New York that the underwriting firm of Hallgarten & Co. is prepared to pay any assessments not met by stockholders.

In the meantime preparations are under way to remove the headquarters of the company from New York to Detroit, although it is not expected that this will take place until after the sale has been confirmed. Several department heads are said to have resigned, and there is every indication that steps are being taken to insure an early return to business activity, as soon as legal proceedings have reached a point where a definite policy can be decided upon.

The Brush and Sampson plants are understood to be idle, except for the production of spare parts. The Stoddard-Dayton factory has completed its schedule and the Columbia organization is said to be finishing the last of its work. The Maxwell's chief plant at Tarrytown, N. Y., is still active, but the factories in Newcastle, Ind., and Providence, R. I., are not being worked. The machinery and material at the latter plant are being shipped to Newcastle, where it is expected to arrive about Jan. 1.

INCREASING CAPITAL STOCK.

Croxton Motor Car Company Finds It Necessary to Double Its Output.

The Croxton Motor Car Company, Washington, Penn., maker of the Croxton line, was organized Oct. 23 with authorized capital of $300,000. Of this amount $180,000 was paid in, leaving a balance of $120,000 in the treasury. A few days ago the company closed a contract with a Chicago house for more cars than it was originally intended to build. This, with the contracts already closed, made necessary an additional capital of $100,000, making a total of $400,000.

The capacity of the new plant, which is an all steel structure, with concrete floors, 500 by 120 feet, is rated at 1000 cars, but it is the desire of the stockholders to increase this at once to a capacity of 2000 machines. It is expected that 200 men will be at work by the first of the year, and that deliveries will begin about Feb. 15.

The officers of the company are: President, J. P. Stoltz; vice president, B. D. Arthur; secretary, G. W. Dudderar; treasurer, J. B. Allison. Mr. Arthur, who formerly was western sales manager of the Ohio Motor Car Company, Cincinnati, O., has been made sales manager of the Croxton concern.

ENTERS ACCESSORY FIELD.

Motometer Company Organized in New York to Produce Novel Heat Indicating Device.

The Motometer Company, Inc., 1784 Broadway, New York City, recently organized, is one of the latest entrants in the automobile accessory manufacturing field. George Townsend, 2d., formerly an amateur racing driver well known in automobile circles, is president and treasurer and Harrison Boyce is secretary. The company will market a new device invented and patented by Mr. Boyce and known as the motometer. It is an instrument which by an ingeniously arranged dial tells the driver at all times the exact heat of his motor and warns instantly when overheating is about to take place.

Mr. Townsend, together with Caleb Bragg, organized the first Yale hill climb at New Haven, Conn., some years ago and together they became well known amateur drivers, racing at numerous meets. Townsend ceased racing prior to Bragg's turning professional. Mr. Boyce has a reputation as an inventor of marked ability. He invented the first demountable rim upon which a patent

Digitized by Google

was granted in this country. It was used on the Locomobile racer in the 1905 Vanderbilt Cup race. He conceived a leather non-skid tire and formed the Healy Leather Tire Company and later he invented the Sireno horn and has been connected with the company manufacturing it for some time.

RESIGNS FROM REMY COMPANY.

Deupree Becomes Associated with Sourbier in Indianapolis Real Estate Firm.

H. G. Deupree, for the past two years assistant sales and advertising manager of the Remy Electric Company, Anderson, Ind., maker of Remy magnetos, has resigned to become vice president and active executive of the Sourbier-Emrick Reality Company in Indianapolis. The president of this concern is E. G. Sourbier, another well known automobile man.

Mr. Deupree has been associated with a number of motor car and accessory companies since graduating from a newspaper desk. He joined the Remy company at the same time F. E. Moskovics became sales manager. It is understood that he will remain with this concern until the first of the year, and may be retained in an advisory capacity for some weeks.

Mr. Sourbier was one of the organizers of the Marion Motor Car Company, Indianapolis, and was associated with J. N. Willys in the development of the Willys-Overland Company. Later he was connected with the Ideal Motor Car Company, which he helped Henry Campbell and Harry Stutz to organize. He is now regarded as one of the most successful real estate men in the Hoosier state.

VAUGHAN COMPANY INCORPORATED.

Expected to Take Over Kingston Plant for Production of Vaughan Cars.

The Vaughan Motor Car Company has been incorporated in New York State and is expected to take over the plant and equipment of the Woods Manufacturing Company, Kingston, N. Y., and to continue the manufacture of the Vaughan cars. The capital of the new concern is $1,000,000. It is proposed to manufacture 500 machines in 1913.

The new company will have $300,000 of cumulative preferred stock and $700,000 of common stock. Thus far no announcement of the personnel of the company has been made, or of the definite plans of the concern beyond the brief statement above outlined. The news of its formation is all the information offered to the public at this time.

TO SUPPLY DETROIT'S LEATHER.

Organization of Company Expected to Affect Local Market in Material Degree.

With the knowledge that Detroit automobile manufacturers use annually $7,500,000 worth of leather, most of which comes from eastern tanneries, Walter S. Gurd of the Hammond building, E. S. Barbour and R. B. Gillespie of the Michigan Stove Company, and Edwin Armitage, an expert tanner, have organized the Armitage Leather Company, with a capital of $35,000 and have opened a plant at 87 West Congress street, Detroit.

The company has already filled its first order and hopes to so increase its business as to warrant the construction of a tannery and the organization of a $250,000 corporation within a year. Mr. Armitage is said to have discovered a secret process of treating leather which it is believed will revolutionize the industry and produce a better material. Mr. Gurd hopes the company can manufacture all the leather Detroit concerns use and at the coming Detroit show, Jan. 27-Feb. 1, some of the company's work will be exhibited in gray, navy blue, black and fancy colors, and suitable for various purposes.

MORE CAPITAL FOR BAILEY.

Rapidly Increasing Business Makes Necessary Provision for Enlarged Production Facilities.

So rapidly has the business of the S. R. Bailey Company, Inc., Amesbury, Mass., maker of Bailey electric vehicles, grown that to increase the production facilities of the concern it is understood that $100,000 worth of preferred stock has been issued. The company plans to gradually increase its scope and the factory will later be enlarged considerably.

The firm has been successful beyond expectations and many orders for its runabout have been received from electric light companies in various cities. It is planned to increase the working force of the plant as fast as the business warrants. It would appear that no definite plans have been formulated as yet.

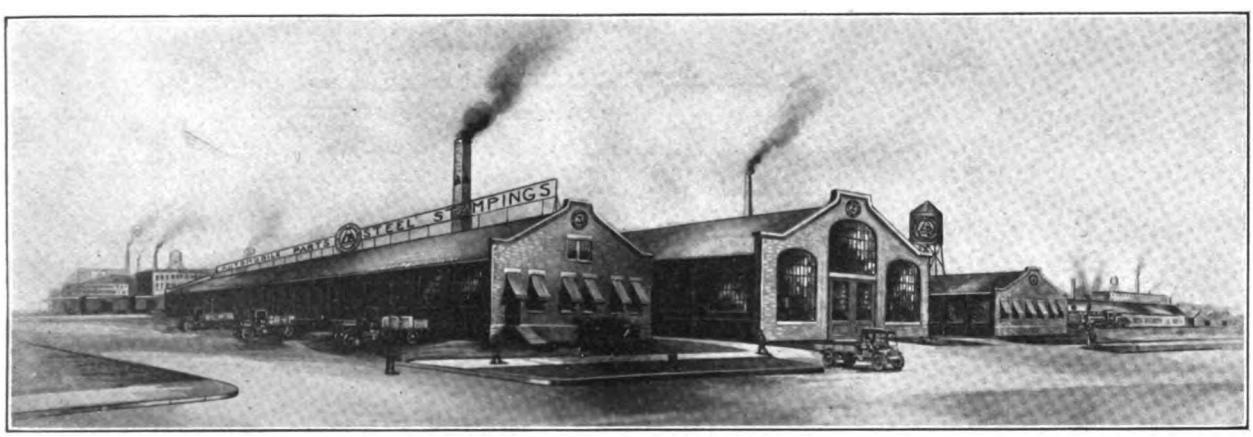
NEW ACCESSORY CONCERN.



Davies-Bach Manufacturing Company Will Locate Plant in Alliance, O.

The Davies-Bach Manufacturing Company, Cleveland, O., has been incorporated under the laws of Ohio and will locate its factories in Alliance. The concern has acquired 17 acres of land on the main line of the Pennsylvania railroad and three buildings already have been erected. Its own list of patented specialties, including radiators, airless tires, horns, etc., will be produced.

The manufacturing end of the business will be in charge of Supt. John Hughes, who for the past four years has been superintendent of the Kinsey Manufacturing Company, Toledo, O. He will be remembered as having been identified prominently with the Hydraulic Pressed Steel Company and Parrish & Bingham, both of Cleveland.

The officers of the company are: President, C. H. Davies, a western capitalist and an experienced automobile man; vice president and secretary-treasurer, J. J. Schmitt, formerly chief auditor of the Packard Motor Car Company, Detroit; directors, George R. Nash, prominently connected with the People's State Bank of Detroit; C. F. Bach, of the Michigan Sugar Company, Sebewaing, Mich., and W. F. Schmitt, also of Sebewaing.

An accompanying illustration gives a splendid idea of the present plant. Factories 1 and 3 are 52 by 206 feet and No. 2 is 63 by 206 feet. These are of the class A construction and were erected by the McClintic-Marshall Construction Company of Pittsburg, Penn. Plans for other buildings already are under way.

General View of the Davies-Bach Manufacturing Company's New Plant at Alliance, O.

RESPONSIBLE FOR COLBY SALES.

F. P. Steinhauer Leaves Abbott Motor Company to Becomes General Sales Manager.

F. P. Steinhauer, for the past two years district sales manager of the Abbott-Detroit cars, made by the Abbott Motor Car Company, Detroit, covering the states of Iowa, Nebraska and part of Illinois, has resigned his position to become general sales manager of the Colby Motor Company, Mason City, Ia., maker of Colby cars. The appointment took effect Dec. 2.

Although not yet 30 years of age, Mr. Steinhauer has attained an enviable reputation and is conceded to be one of the most successful automobile salesmen in the Middle West. He is a man of large ideas and works with an enthusiasm that has invariably brought him big results. Prior to joining the sales force of the Buck Auto Company of Davenport, Ia., a number of years ago, Mr. Steinhauer was a public school teacher. Several other companies also engaged his services before he joined the Abbott Motor Company, and his experience in the retail selling field has been of particular value in this connection.

JOINS REO TRUCK FORCE.

R. E. Paris, Formerly of Olds Motor Works, to Aid in Marketing New Model.

Rupert E. Paris has joined the executive staff of the Reo Motor Truck Company, Lansing, Mich., maker of Reo trucks, as the result of negotiations which have been carried on quietly for some time. Until recently Mr. Paris was sales manager and assistant treasurer of the Olds Motor Works, having gone to Lansing when the

Digitized by Google

Oldsmobile was taken over by the General Motors Company.

His addition to the Reo company is for the purpose of strengthening the managerial staff of the organization to keep pace with the wonderful growth of the business, which was founded only two years ago. The concern has added to its line a truck of two tons capacity and the new vehicle, which has been particularly well received, will be exhibited at the principal motor car shows the coming season.

WARREN SECURES MORE CAPITAL.

Plans Inaugurated to Care for Increased Business During the Coming Year.

At a recent meeting of the stockholders and others interested in the Warren Motor Car Company, Detroit, Mich., maker of Warren cars, steps were taken to increase the working capital of the organization. Plans also were inaugurated looking toward a largely increased business during the 1913 season.

The following board of directors was elected: F. H. Lewis, Jackson and Detroit; S. G. Jenks, Port Huron; H. H. Bassett, Flint; J. V. Mowe, Akron, O.; G. John, New York City; C. R. Wilson, C. Haines Wilson and Homer Warren. The last three are Detroit men and have been connected with the Warren company for some time past.

TONE HEADS NEW COMPANY.

Another Car to Locate in the Middle West, Probably at Indianapolis.

Although not yet ready to make a public announcement, it is understood that another Indiana motor car manufacturing concern is about ready to enter the field with a medium priced machine which will bear the name of Tone. The company is to be known as the Tone Car Corporation and will be headed by Fred I. Tone of Indianapolis. It is expected that the factory will be located in that city.

Mr. Tone became connected with the automobile industry in 1896, starting with the Locomobile Company of America, now at Bridgeport, Conn. Later he was engineer with the Marion company in Indianapolis. In 1905 he was instrumental in creating a radical departure from conventional lines by producing the American underslung design. For the past two years he has been general engineer for the Willys-Overland Company, Toledo, O.

It is understood that the Tone Corporation will built but one style of chassis, with a choice of standard bodies, including roadster, touring, coupe and light delivery. The complete car will be constructed in the factory of the company.

ADDS THREE BUILDINGS.

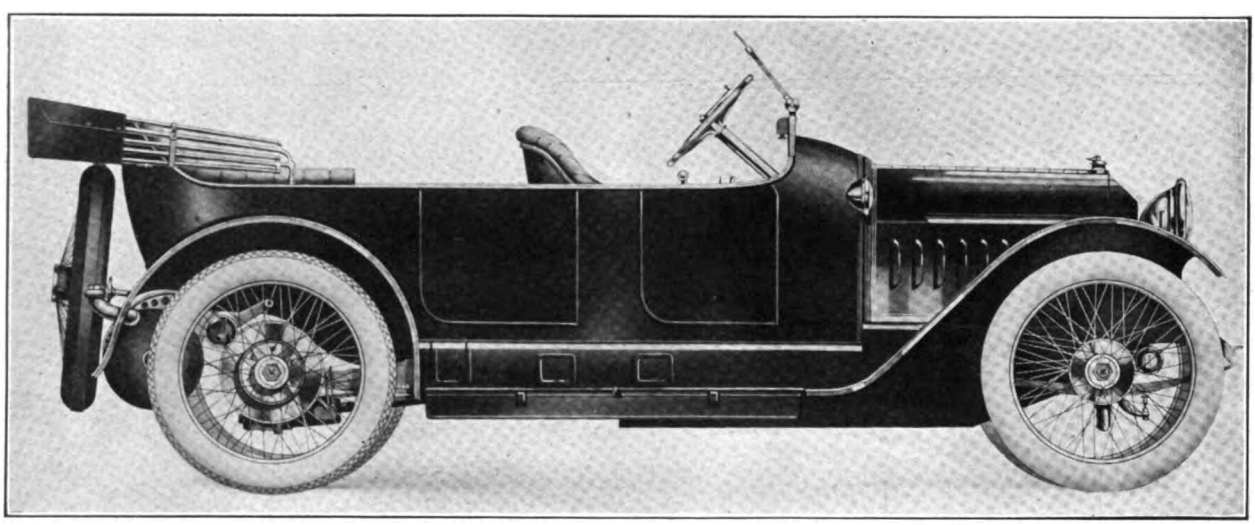
Increase in Packard Plant Makes Possible Production Throughout the Entire Year.

Aiming at production all the year round, the Packard Motor Car Company, Detroit, maker of Packard cars, has added three new buildings, providing an additional acre of floor space. The policy of the Packard company is to bring out two models annually, the big six in the spring and the little six in the autumn, although the production of each is to continue through a whole year.

This will bring something new from the plant each half year. This year the Packard 48 made its debut about June and the 38 in November. The latter will appear in every type but the seven-passenger touring car, which is only fitted to the 48. Both models are sixes and the production will be about equal in number.

MOTOR PLOWS IN CALIFORNIA.

Union Tool Company Erecting Factory for Production of Industrial Vehicles.



Ground has been broken for the erection of a factory to cost $100,000 to be built by the Union Tool Company at Torrance, Cal., near Los Angeles. The new plant will lie directly east of the Union Tool Company's $1,000,000 institution and between it and the $100,000 plant of the Pacific Metal Products Company, and will be used for the construction of traction plows and motor trucks. The building will occupy a space 82 wide by 240 feet long and it will be two stories in height.

The traction plow, which will be constructed on the lower floor, will be of 80 horsepower and will be capable of throwing four furrows at one time. The wheels will be six feet in height and the engine is placed directly over the forward axle. The construction of the new machine is really an innovation in the automobile business as far as the West is concerned and is planned for export trade, as well as for use in the southwest. the Sacramento and the San Joaquin valleys.

Digitized by Google

NEW EDWARDS-KNIGHT IS WORM DRIVEN.

ALTHOUGH announcement of the Edwards-Knight car was made some time ago by the Edwards Motor Car Company of New York City, of which C. G. Stoddard is president and H. J. Edwards, vice president and general manager, complete details of the new model were not made public until recently. The new chassis, which is known as model 25, will appeal to the discriminating motorist as in it are incorporated American and English characteristics indorsed by sound engineering practise. Features of the design are: Double dropped frame, Lanchester type rear suspension, worm drive, wire wheels, Knight motor, electric lighting and motor starter. The equipment is very complete. Six types of bodies are listed, a five-passenger touring, four-passenger roadster, seven-passenger limousine, two-passenger speedster, two-passenger roadster and seven-passenger landaulet. The last three named are built to order, the other styles being standard.

The Edwards-Knight Five-Passenger Touring Car, Features of Which Include Knight Motor, Worm Drive and Novel Rear Spring Construction.

The new motor has all of the 1913 improvements that the European licensees have incorporated in the Knight type, including long stroke, inner and outer sleeves the same thickness, and change of timing to give a maximum opening of the ports on both the intake and exhaust strokes. The twin-cylinder castings and cast iron sleeves and pistons are imported.

Knight Motor.

The motor is a water-cooled, four-cycle unit of the I type, having a four-inch bore and 5.5-inch stroke, and is catalogued at 25 horsepower. The rating is 25.6 by the S. A. E. formula, and it is maintained that it will develop considerable in excess of that. The piston displacement is 276.5 cubic inches. The water jackets are cast integral and are ample in size to provide efficient cooling under all conditions of service.

The crankshaft is a drop forging of chrome nickel steel, 2.25 inches in diameter, carefully ground to size, and rotates in five bearings having a total length of 14.375 inches. They are retained in the upper section of the crankcase and the shaft rotates in bronze members lined with .03125 inch of babbitt.

The connecting rods are tubular forgings of round section, drilled out to reduce weight and the wall is increased in thickness at the point subject to the greatest stresses. The pistons are of cast iron, carefully ground, and have concave heads. They are provided with three eccentric rings above the wristpin, which is of steel, hardened and ground, and key retained. Each piston has three oil grooves, two above and one below the wristpin.

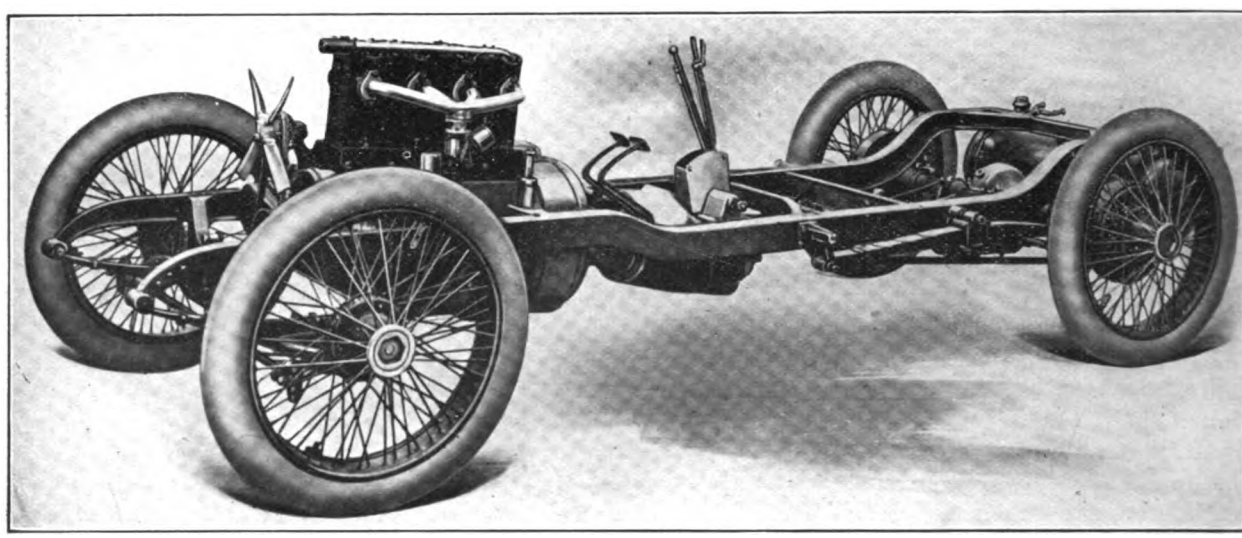
The eccentric shaft is of a high grade steel, ground to size and rotates in plain bearings. Silent, non-adjustable chains are utilized to drive it and the lay shafts. The drive to the eccentric runs on pulleys with 6.76-inch centres and that to the magneto with 8.8225-inch centres. Both are broad and of six pitch.

The crankcase is in two sections, both of aluminum, the lower serving as the oil reservoir. It is divided on the centre line of the crankshaft.

Digitized by Google

The intake ports are located on the left hand side of the motor with exhaust at the right, and each has a circumferential length on the sleeves of 3.5 inches. The intakes are .472 inch high and exhaust .7 inch, or in other words, the intake port is equivalent to 1.645 square inches opening and the exhaust to 2.45 square inches. The intake opens 15 degrees late and closes 36 degrees late, and the exhaust opens 55 degrees early and closes five degrees late.

English Carburetor.



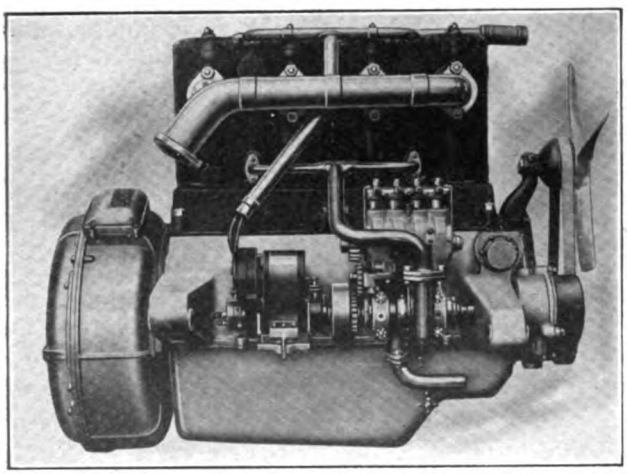
Carburetion is by an S. U. vaporizer, water jacketed. This is located on the left of the motor and the intake manifold is provided with individual leads from the main member, which is compact and well designed. The carburetor is an English production, the rights of manufacturing having been secured by the Edwards company. A feature of the vaporizer is that the area of air surrounding the nozzle is automatically varied by the suction of the piston acting upon a bellows which in turn controls a piston. The latter obstructs the air passage and at high motor speeds the piston is drawn out of this passage, increasing its area and lessening the suction on the fuel in the nozzle. The governing bellows is contained within the cylindrical part of the housing, which it will be noted is mounted at an angle. The vertical chamber contains the float. Air pressure for the feed is through a plunger pump driven from the eccentric shaft.

Lubrication.

Lubrication is by a force feed system, the lubricant being pumped from the reservoir by an automatic plunger pump located in the crankcase and actuated by the eccentric shaft, being forced to the pressure reservoir, whence it is distributed by leads to the bearings and all important motor parts. The pressure varies with the throttle opening, assuring efficient lubrication without smoking or carbon. The oil is filtered by a screen in the oil fillers and a perforated baffle plate. The capacity is 2.5 gallons.

Dual ignition is provided by a Simms magneto which is located on the right of the motor and is driven by enclosed silent chain through the pump shaft. One set of plugs, located in the centre of the cylinder, is utilized, and the second ignition system is through a distributor on the magneto, current being supplied from a storage battery. The coil, switch and vibrator units are located on the dash.

The centrifugal water pump is placed at the right and is driven by shaft actuated by silent chain. The water manifolds are of brass, nicely finished, the intake being on the lower right hand side of the motor with the outlet on the top at the left. The radiator is of the honeycomb type, located over the front axle. Cooling is assisted by a four-bladed, cast aluminum fan, rotating in ball bearings and driven by belt from the crankshaft. It is adjustable by an eccentric in a bracket.



The Edwards-Knight Chassis, Showing Dropped Frame, Unit Clutch and Transmission and Lanchester Springs.

Unit Clutch and Gearset.

The clutch and gearset are combined, the former being of the dry disc type, steel on Raybestos, and contained within a separate compartment. It is supported in front on a double race of Timken rollers and at the rear by a single race. The gears are of a high-grade nickel steel, as are

Digitized by Google

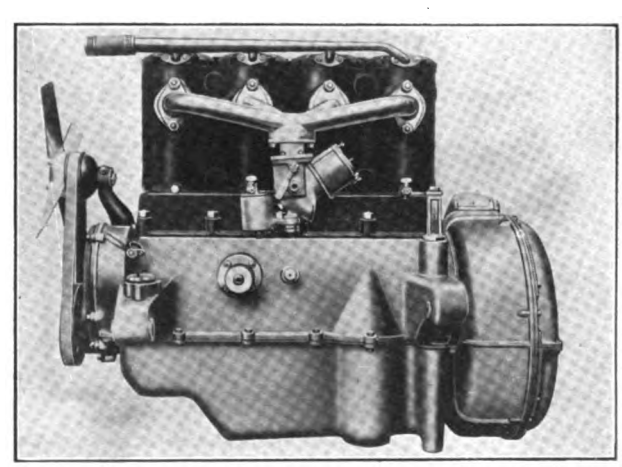
the shafts, and Timken bearings of the short series type are employed. There are four forward speeds with direct on third, and the usual reverse.

Exhaust Side of the Edwards-Knight, Showing Enclosed Dynamo-Motor Starter and Location of Power Tire Pump.

The gearbox is flexibly mounted upon two frame cross members, in front through a trunnion and through two points at the rear—a form of three point suspension.

Both the motor and gearbox are so mounted as to decline slightly to the rear, so that with the car loaded a straight line drive is provided through the shaft, which is 1.375 inches in diameter and of a high grade steel. The driving shaft and worm shaft are also in a straight line. Universal joints are utilized at either end of the shaft, but the construction of the torque and two distance rods is such that they operate in unison, eliminating all sliding movement in the universal joints. The angles in the front and rear members are the same at all times; that is, the angle between the gearshaft and the drive shaft in the front joint equals that between the drive shaft and the worm shaft in the rear joint, neutralizing the acceleration and retarding action taking place during each revolution in a universal joint.

The radius rods are connected to the side members of the frame and have ball and socket supports. The torque rod is a tapered tubing, doubly and flexibly supported in front. The ball end stud is carried in a cross member of the frame and the other end on the torque tube. The vertical tube containing them has four coil springs, one above and the other below, so that a universal action is secured.

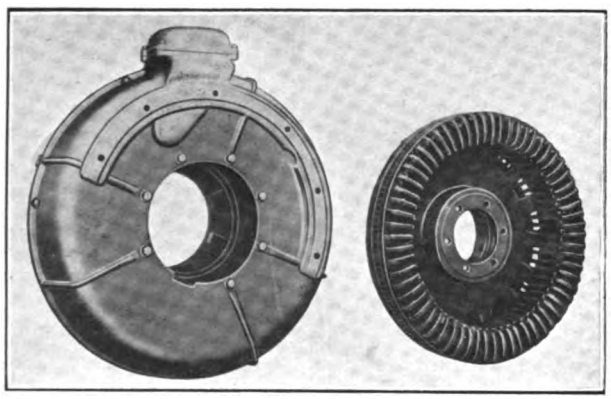


Full Floating Axle.

The worm driven rear axle is of the full floating type with a malleable iron differential housing and the straight type worm is mounted underneath the bronze worm wheel. The axle housing is a standard type of Timken stamping and the diameter of the axle shafts is 1.25 inches. The worm shaft is carried fore and aft on special, non-adjustable Timken rollers. The worm and worm wheel with differential are mounted in a steel casting hung on the underside of the axle stamping. There is a four to one reduction between the worm and the wheel. An inspection plate is provided.

The frame is of pressed steel, .1875 inch thick with 4.0625 inches channel and section of 3.25 inches. It is of the double drop type, making for a low centre of gravity, and five liberal cross members are employed. Semi-elliptic springs are fitted in front, these being 38.5 inches long and 2.25 wide, and the spring hangers are of malleable iron. The rear springs are of the Lanchester type, being inverted semi-elliptics supported in their centre to the frame through a trunnion. They are shackled at their front to the frame and a shackle roller arrangement is utilized at the rear, compensating for backward and forward movements. The springs are 54 inches long by 2.5 wide. Self-lubricating bolts are employed, also grease cups.

Steering Mechanism.



The front axle is a drop forging of the I beam section type and the draglink is a tube located in front. Tubing is also utilized for the tiebar. The steering gear is located at the left and is a Gemmer, of the worm and worm wheel type. The angle of the steering column is 42 degrees. The wheel diameter is 18 inches and the wheel rim is

Intake Side of Edwards-Knight Motor, Illustrating Peculiar Construction English S. U. Carburetor.

of hard rubber with an aluminum core. The spider is also of aluminum. The gas and spark levers are mounted on the wheel and provision is

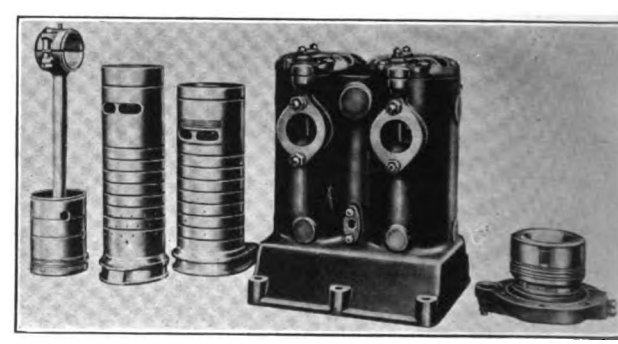
Digitized by Google

The United States Lighting Dynamo and Motor Starter: At Right, Armature Which Replaces Flywheel; at Left, the Housing.

also made for the lubrication of the column.

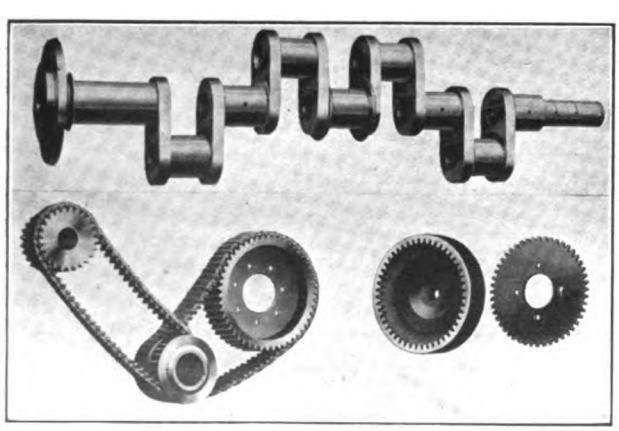
Left hand drive and centre control are employed with clutch pedal at the left and service brake pedal at the right. An accelerator is located on the toeboard. Two sets of brakes are fitted, the service being of the external contracting type and the emergency, internal expanding on the rear wheels. The wheel brake drums are 14 inches in diameter with two-inch face and both sets are lined with Raybestos. The wheelbase is 120 inches and tread 56.

Wire Wheels.



Detachable wire wheels are fitted as standard, although option of wood is given. Quick detachable tires, 36 by 4.5 inches are employed both front and rear. The gasoline tank has a capacity of 28 gallons and a reserve member is housed within the larger container. Feed to the carburetor is by pressure, the tank being placed at the rear end of the frame. A gauge is also standard equipment, being located in the tank.

The electric lighting equipment and motor starter is made by the United States Light & Heating Company, New York City, and these are incorporated in the flywheel of the motor. The armature is bolted directly to the engine shaft flange in place of the flywheel and rotates with the motor shaft. The field is bolted to the crankcase concentric with the engine shaft and it is obvious that the construction eliminates gears, chains, sprockets, etc.



When utilized as a motor starter, current is supplied by a storage battery of ample capacity. The control lever is located conveniently on the dash. Upon the motor starting, the starter becomes a generator, recharging the battery and supplying the necessary current for lighting the lamps. The generator-motor starter is enclosed in a housing and one of the qualities emphasized of it is maximum efficiency with minimum attention.

The equipment is very complete. The top is a Golde, mohair, a feature of which is that it may be operated by one person, and a dust cover is also included. The windshield is a one-piece special design and the dash is equipped with a ventilating device. The Stewart speedometer is driven off the propeller shaft and two signalling horns are fitted, an electric and a bulb. The lamps are five in number, all electric. Robe and foot rails are provided, also a full set of tools, jack and tire repair kit. Connecticut shock absorbers are utilized, and a power tire pump is mounted between the water pump and magneto. When wood wheels are specified, demountable rims are fitted with one extra member. One extra wire wheel is standard. All trimmings are nickel plated and the lamp equipment for the limousine includes dome and complete interior accessories.

The body designs are particularly striking with straight line effects and the fenders are well proportioned. The finish is high grade and throughout the appointments are in every respect in keeping with the rich design.

Sleeves, Piston, Connecting Rod and Cylinders of the New Edwards-Knight Car.

Illustrating the Hollow Crankshaft and Arrangement of Silent Chain Drive for Eccentric and Magneto Shafts.

MANY CITIES PLAN FOR SHOW SEASON.

National Circuit Will Receive Direct Aid from Car Manufacturers--Three Important Displays in Canada--Large Dealers' Exhibitions in Other Centres.

WHILE there is no change in the plan heretofore carried out by the manufacturers of cars, under which the shows at New York and Chicago are the only ones in which the makers display directly, the so-called minor show circuit of previous years has been raised to the dignity of a national show circuit. Under this arrangement the sales manager of the different concerns will co-operate with the management of such shows as have received the sanction of the National Association of Automobile Manufacturers in this connection.

The cities included in this circuit and the dates upon which the shows will be held are: Cleveland, O., Jan. 4-11; Philadelphia, Jan. 20-25; Detroit, Jan. 27-Feb. 1; Minneapolis, Minn., Feb. 10-15; Kansas City, Feb. 17-22; St. Louis, Mo., Feb. 24-March 1; Pittsburg, Penn., March 3-8; Boston, March 8-15; Buffalo, N. Y., March 17-22; Indianapolis, Ind., March 24-29.

This is by no means a complete list of the displays which will be held throughout the country, as may be gathered from a perusal of the coming events column in this issue, and some of these exhibitions will be of large proportions. In many cities separate shows will be held for the display of mechanical transports.

CLEVELAND PLANS COMPLETE.

An Acre and a Half of Floor Space Available in the New Wigmore Building.

To Cleveland belongs the honor of holding the first show of all, its opening date being a full week ahead of the New York displays. Manager Fred H. Caley has secured the new Wigmore building, on East 13th street, near Euclid avenue, which will be utilized as a garage at the conclusion of the exhibition. It affords practically 1.5 acres of floor space, or just about three times as much as the Central armory, where previous displays have been held.

Officially the exhibition will be designated the sixth annual show of the Cleveland Automobile Club, and the committee in charge is composed of H. M. Adams as chairman, Fred C. Wood as secretary and C. M. Brockway as treasurer. The centre of the building will be devoted to pleasure cars and trucks and the motorcycles and accessories will be distributed along the sides. Some new ideas in decoration and lighting effects are promised. The complete list of makes to which space has been allotted is as follows:

Detroit electric, Overland, Baker electric, Broc electric, Buick, Cadillac, Studebaker, Chalmers, Ford, Franklin, Hudson, Marmon, Cartercar, Jackson, Paige-Detroit, Rambler, Cutting, Lozier, Rauch & Lang electric, Reo, R-C-H, Stearns, Pierce-Arrow, Garford, White, Winton, Flanders, Imperial, Stutz, Case, Standard electric, Michigan, Little Giant truck, Republic, American, Marion, Sandusky truck, Stevens-Duryea, Saurer truck, Mack truck, Apperson, Hupp-Yeats electric, Premier and Mercer.

EVERYTHING READY AT MONTREAL.

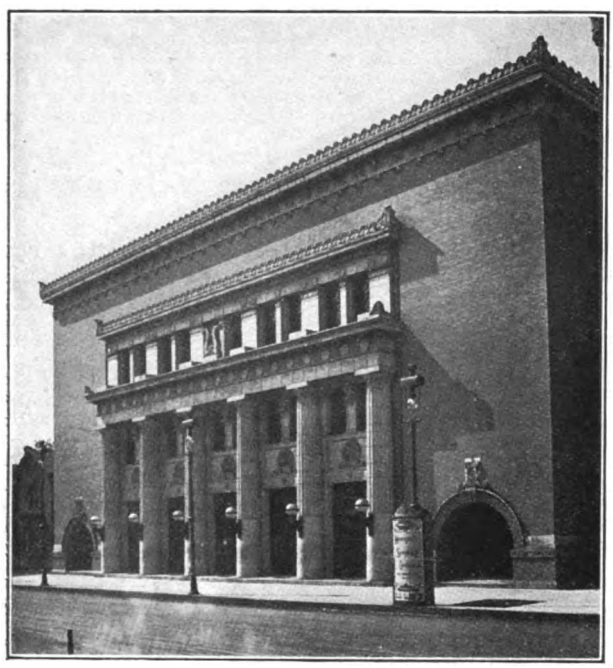
Curtiss Flying Boat to Occupy Prominent Place in Decorative Scheme.

The Montreal motor show will open in the drill hall and 65th armories, Montreal, Quebec, Jan. 4, for one week. As in the past the display is under the management of E. M. Wilcox, 123 Bay street, Toronto, Ont. The event will be opened formally by Sir Lomer Gouin, lieutenant-governor of Quebec.

With an addition of 30,000 square feet of floor space over previous years, the number of exhibits is much larger than heretofore. All of the cars manufactured in Canada will be represented, as well as most of those produced in the States. Others will be shown by British and French makers.

A special feature of the decorative scheme will be a Curtiss flying boat, a duplicate of the one now being built for the German navy and those in use by the United States government.

CANADA'S LARGEST SHOW.



American and British Manufacturers Will Compete in Separate Sections.

The annual Toronto automobile show, which will be held in the Government and Transportation building, Feb. 20-March 1, will be the largest event of this character ever held in the Dominion. The exhibition will be under the management of E. M. Wilcox, 123 Bay street, who has had charge of previous displays in Toronto

Digitized by Google

and Montreal, and will be national in its scope. Opportunity will be afforded for a full comparison between American and British productions.

The building contains approximately 100,000 square feet of floor space, which is about double the accommodations heretofore provided in the armories. As a result of plans now under way, it is anticipated that the Society of Motor Manufacturers & Traders in Great Britain will send some 40 exhibits to be housed together in a British section. Inasmuch as a large number of American makers always have been represented at this display, it would appear that the Toronto

National Guard Armory, Where Minneapolis' National Circuit Show Will Be Held.

show would rank well toward the largest in the Western Hemisphere.

Still another feature of the exhibition will be the special section devoted entirely to motorcycles, making the first Canadian national motorcycle show.

MINNEAPOLIS ON THE CIRCUIT.

National Guard Armory and Annex Will Be Utilized for Big Northwest Display.

In becoming a member of the national show circuit, Minneapolis, Minn., secures the first show to be held in the Northwest, Feb. 8-15, and expects to have an exhibit of automobiles and accessories almost as complete as those held in New York and Chicago. During a recent visit to Detroit, Manager Walter Wilmot was assured that many splendid cars which are being prepared for the New York show would be shipped from that city to Detroit, then to Chicago and thence to Minneapolis.

This display will be of decided importance to the Northwest in the opinion of manufacturers and will bring together thousands of dealers and agents in the section. The exhibition will be held in the National Guard armory, to which an annex will be constructed, giving to the Minneapolis Automobile Trade Association, under whose direction it will be staged, an addition of approximately 18,000 square feet, or over 40,000 square feet in all.

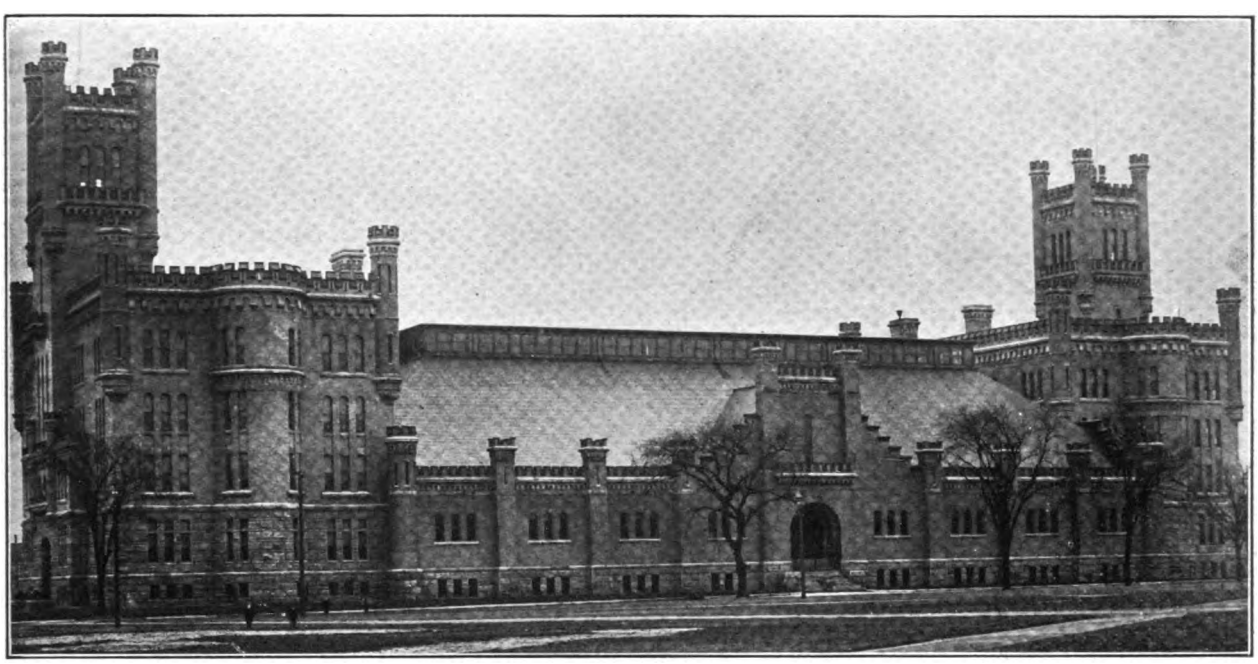
EXHIBITORS AT HARTFORD.

Demand for Show Space in Connecticut's Capital Indicates Representative List.

While not a member of the national circuit, Hartford, Conn., is a city of decided importance in the show field, as is indicated by the fact that the new state armory affords some 50,000 square feet of floor space. Chairman F. W. Dart of the show committee of the Hartford Automobile Dealers' Association reports that already 40,000 square feet has been allotted. The exhibition will be held Feb. 8-15. Among those who will make display are the following:

Pleasure Cars—Capitol City Auto Company, Mitchell; Electric Auto Station, ———; Carl H. Page Company, Chalmers; Fred T. Reid, National; Palace Auto Service Company, Hudson, Studebaker, Waverley electric; Stevens-Duryea Company, Stevens-Duryea; L. H. Elmer, Ford; E. H. Harris, Overland; Arthur E. Parsons, Detroit electric; S. A. Miner, Pierce-Arrow; Columbia Motor Car Company, Columbia; New England Garage Company, Cutting; Stutz Motor Car Agency, Stutz; Skinner Bros., Stearns-Knight; Brown, Thomson & Co., Cadillac, Rauch & Lang electric; S. A. Foster, Rambler, Regal; Buick Garage Company, Buick, Locomobile, Little; Packard Motor Car Company, Packard; Russell R. Taber, Réo; Eldred Clark, Paige; Pope Manufacturing Company, Pope-Hartford; R. M. Spencer, KisselKar; R. D. & C. O. Britton Company, Maxwell, Flanders electric.

Commercial Vehicles—S. A. Foster, White; Brown, Thomson Company, ———; S. A. Miner, Pierce-Arrow; Packard Motor Car Company, Packard; Russell P. Taber, Reo; Eldred Clark, Paige; Pope Manufacturing Company, Pope-Hartford; Palace Auto Service Company, Waverley electric; R. M. Spencer, KisselKar; Hartford Electric Light Company, G. V. electric; R. D. & C. O. Britton Company, Federal.



Sundries—Finch & Hayes, motorcycles; Post & Lester Company, accessories; Perry Motor Supply Company, accessories; W. M. Apperson, J. M. Shock absorber; Chas. E. Miller, general accessories; Universal Auto Repair Company, parts; C. A. Carroll Company, clothing, etc.; G. W. Fuller, trunks; H. B. Munchow, shock absorbers; Richardson Tire Company, tires; Todd Rubber Company, tires.

Digitized by Google

SECOND ANNUAL IN PROVIDENCE.

Decorative Scheme to Exceed Splendid Results Obtained Last Year.

The first annual display of the Rhode Island Automobile Dealers' Association in the state armory, Providence, R. I., last winter, was a fitting revival of the exhibitions which marked the early days of the industry in New England. Under the able management of A. S. Lee, who has been secured for this position again this season, nearly every dealer in the city and vicinity was represented. The decorations were of such character as to cause unusually favorable comment.

State Armory, Providence, R. I., Scene of the Second Annual Display of the Rhode Island Automobile Dealers' Association.

The contract for decorating the building for the coming show, Jan. 25-Feb. 1, has been placed with the same people, H. Ladd Walford and G. Frederick Bohl, and it is announced that the scheme will far surpass that of 1912. The main idea will be that of a Japanese imperial garden, over which will be stretched azure cloth to form a sky, and from which will gleam thousands of electric lights. Several thousand flowers are to be imported from the native soil in Japan for the occasion.

Provision will be made for 150 exhibitors. The main drill shed will afford 20,000 square feet, and in addition the basement and certain anterooms will be available for this purpose. There is every reason to believe that the event will be one of the most important in New England, outside of Boston.

BROOKLYN DEALERS BUSY.

Plans Nearing Completion for Third Annual Display in 23rd Regiment Armory.

The Brooklyn Motor Vehicle Dealers' Association has decided upon the week of Feb. 22-March 1 as the date for the third annual display in the 23rd Regiment armory. The show committee, of which Herbert L. Carpenter, the recently elected president of the association, is chairman, has selected Harry A. Cochrane as manager. Mr. Cochrane is president of the National Printing & Advertising Exposition, and has had considerable experience in promoting industrial exhibitions throughout the country.

Despite the fact that Brooklyn is so close to the national exhibitions in Madison Square Garden and Grand Central Palace, it has been demonstrated during the past two years that the show held in that city has been productive of much business. The Brooklyn show has come to be recognized as a buyer's display, and already almost twice as many dealers have made application for space as were accommodated last year. The armory has 60,000 square feet of floor space,

Digitized by Google

and present indications are that it all will be taken long before the opening date.

PLANS IN OTHER CITIES.

First Display in St. John, N. B.—Two Shows in Kansas City—General Items.

The first automobile show to be held in the maritime provinces of Canada will be that of the New Brunswick Automobile Association in the drill hall at St. John, Feb. 8-15, under the management of E. M. Wilcox. The conditions in this section are very active and a great deal of interest is being taken in motor cars. Applications for space already have been received from dealers in Boston, some of whom enjoy quite a little business in St. John and New Brunswick.

The annual Cincinnati automobile show will be held in Music Hall, Feb. 24-March 1. The members of the committee in charge are in daily conference, utilizing to advantage their knowledge of technical detail to the end of serving the public with the best that can be obtained. The decorations this year will be on a scale of grandeur that will transform Music Hall into a garden of warmth and beauty. The committee is composed of the following: H. S. Leyman, chairman; E. A. Kruse, secretary; R. C. Crowthers, W. G. Welbon, F. H. Miller, H. O. Brunton, J. W. Tarbill.

The Milwaukee Motor Show Association, a new corporation, will hold the fifth annual motor show in the Auditorium at Milwaukee, Wis., Jan. 11-17. Blank applications for space have been issued.

Two distinct shows will be held at Kansas City, Mo., this year, dates for the pleasure car exhibit being Feb. 17-22. The commercial cars will be shown Feb. 24-27. The first will be the largest ever given under the direction of the Kansas City Motor Car Dealers' Association and the commercial vehicle display will be the pioneer exclusive truck show ever held in that city and vicinity.

The Tri-City Auto Dealers' Association held a meeting recently at Davenport, Ia., and set the dates for the annual automobile show as Feb. 19-22. The annual meeting was held also at that time, the following officers being elected: President, G. F. Burmeister, Davenport; vice president, Emil Buck, Davenport; secretary, Webb Mason, Davenport; directors, G. F. Burmeister, Emil Buck, Webb Mason, W. C. Totten, Rock Island; Fred R. Young, Moline.

COMING EVENTS.

January.

Jan. 2-10—Importers' Salon, New York City.
Jan. 4-11—Show, Montreal, Can.
Jan. 4-11—Show, Cleveland, O.
Jan 11-17—Show, Milwaukee, Wis.
Jan. 11-18—Show, Madison Square Garden, New York City.
Jan. 11-18—Show, Grand Central Palace, New York City.
Jan. 20-25—Commercial car shows, New York.
Jan. 20-25—Show, Philadelphia, Penn.
Jan. 22-25—Show, Geneva, N. Y.
Jan. 23-Feb. 1—Show, St. John, N. B.
Jan. 25-Feb. 1—Show, Providence, R. I.
Jan. 27-Feb. 1—Show, Detroit, Mich.
Jan. 27-Feb. 1—Show, Scranton, Penn.
Jan. 30-Feb. 1—Show, Canadaigua, N. Y.

February.

Feb. 1- 8—Pleasure car show, Chicago, Ill.
Feb. 3- 8—Show, Washington, D. C.
Feb. 8-15—Show, Hartford, Conn.
Feb. 10-15—Show, Minneapolis, Minn.
Feb. 10-15—Commercial car show, Chicago, Ill.
Feb. 11-15—Show, Ottawa, Can.
Feb. 15-22—Show, Richmond, Va.
Feb. 15-22—Show, Newark, N. J.
Feb. 17-22—Pleasure car show, Kansas City, Mo.
Feb. 19-22—Show, Davenport, Ia.
Feb. 20-March 1—Show, Toronto, Can.
Feb. 24-27—Commercial car show, Kansas City.
Feb. 22-March 1—Show, Brooklyn, N. Y.
Feb. 24-March 1—Show, Omaha, Neb.
Feb. 24-March 1—Show, Cincinnati, O.
Feb. 24-March 1—Show, St. Louis, Mo.

March.

March 1- 8—Show, Pittsburg, Penn.
March 8-15—Pleasure car show, Boston, Mass.
March 17-22—Show, Buffalo, N. Y.
March 19-26—Commercial car show, Boston.
March 24-29—Show, Indianapolis, Ind.

Calgary and Edmonton, the two principal cities of the province of Alberta, Can., are 220 miles apart, but that fact tells nothing of the difficulty of making the trip in an automobile. When H. H. Kerr of Calgary recently arrived in Edmonton, he states that more than 700 pounds of mud were scraped and washed from the wheels and axles. Mr. Kerr had four heavy men with him, but his machine, a 40 horsepower KisselKar, made by the Kissel Motor Car Company, Hartford, Wis., made the journey with no trouble of any kind.

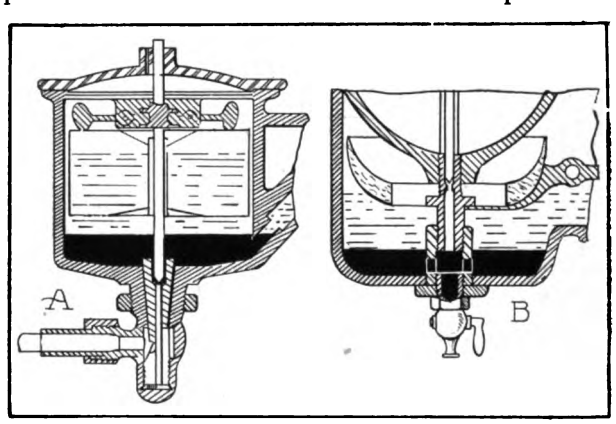
TIRES AND WINTER DRIVING.

Tires require considerable care during the winter owing to their being subjected to moisture. They should be examined from time to time for cuts and if any be discovered they should be vulcanized. With the highways covered more or less with snow and ice, the treads of the shoes retain moisture due to friction. The water penetrates to the fabric when a cut exists in the tread and the tire blows out, much to the wonderment of the operator.

As many endeavor to make the tires used in the summer go through the winter, and usually the tread is pretty well worn, it follows that the rubber is easily cut. With the numerous tire preparations and moderate priced vulcanizers, easily operated by the owner, there is no reason why repairs cannot be effected at little expense.

ICE IN CARBURETOR.



Water begins to congeal at 32 degrees Fahrenheit. At lower temperatures it freezes much more quickly and the time taken to solidify the fluid depends upon the mass, etc.

Because gasoline will not freeze, the motorist does not give the necessary attention to the care of the fuel system during the winter months. When water collects in the carburetor in warm weather it is a simple matter to remedy the trouble by opening the drain cock and removing the fluid, but this may not be so easy in the winter.

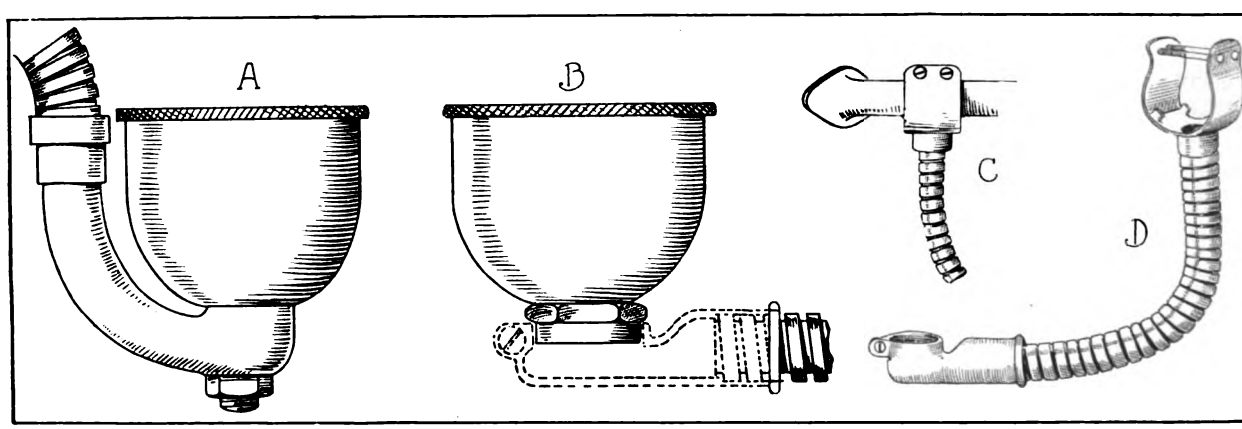
An instance was noted recently of a driver who had left his car exposed to the cold for several hours and his attempts to start the motor were unsuccessful, although the cylinders were primed repeatedly. An examination of the vaporizer resulted in the discovery of ice which had choked the fuel passages leading to the spraying nozzle. It was necessary to remove and clean the carburetor before the engine could be started.

That the fuel should be strained carefully and the filter opened frequently in cold weather is demonstrated by the accompanying illustration, which depicts the float chambers of two carburetors, showing how ice could form and prevent the passage of the fuel. The dark lines represent ice and at A it will be seen that it blocks the orifice leading to the spraying chamber. The fuel existing above the ice in the passage would not be sufficient to obtain more than a few explosions.

At B is depicted another design and here the gasoline flows into the spraying nozzle passage through two small openings. It would only require sufficient water to cover these apertures

Showing the Importance of Keeping Fuel Free from Water: A, Illustrating Formation of Ice in Float Chamber, Stopping Passage to Spraying Chamber; B, Depicting Level of Congealed Mass Above Apertures to Nozzle.

and a freezing before the supply of fuel would be shut off. By opening the drain cock of the carburetor and filter and allowing a small quantity of fuel to flow, formation of ice will be prevented.



It is an excellent idea when the lighting system is acetylene and a generator is employed to remove the tubing and displace any water that may have accumulated as the fluid may freeze in cold weather.

ADVANTAGES OF HOT AIR IN CARBURETION.

Carburetion is an important factor with the gasoline automobile, and motorists are continually experiencing more and more difficulty in obtaining a mixture making for easy starting and successful operation. When it is considered that the function of the carburetor is to blend certain proportions of vapor and air, and to maintain the proper values at varying motor speeds, it may be said truthfully that the manufacturer has made considerable progress towards perfecting the vaporizer. With motor fuel becoming heavier and heavier, the problem of carburetion is receiving greater attention from motorists than formerly when a more volatile fluid was utilized.

During the past year the fitting of carburetors with chambers for utilizing heated water or hot air to facilitate vaporization has become more noticeable, and many car makers also are employing a flexible tubing for conveying the heated air of the exhaust pipe to the air inlet of the vaporizer.

Utilizing Heated Air Makes for More Efficient Carburetion in Cold Weather: A, Application of Col-Mac Hot Air Pipe to Schebler Vaporizer Having Elbow Bend; B, Showing Clamp for Attachment to Another Design; C, Method of Attaching to Exhaust Pipe; D, Flexible Tubing, Hood and Clamp.

To understand the function of the heated air and its proper application it should be borne in mind that the air drawn into the carburetor by the suction of the piston, passes over the spraying nozzle and the vapor is mixed with it, creating what is termed the mixture. The more perfect the mixture the quicker it burns and the more complete is the combustion. Rapid evaporization of the fuel is desirable and it is important that the mixture reach the combustion chamber without the value being changed.

It is held by one maker that air should be taken as free from atmospheric moisture as possible. He maintains that dried air will absorb moisture, that of the vapor, much more quickly and more perfect carburetion is obtained as a result. It is held that air should be taken into the cylinders as nearly as possible to atmospheric pressure and that expanded air is not desirable. Taking in dried, warmed air results in a slight expansion, but not to a harmful degree as the cold of the vacuum in the mixing chamber absorbs the heat and contracts the air quickly to less than its original volume.

Using heated air from the exhaust is not new, but considerable improvement has been made in its application. The adoption of flexible metal tubing makes for compactness and ease of installation. This is noticeable in the Col-Mac, manufactured by the Breeze Carburetor Company, Newark, N. J., various applications of which are shown in accompanying illustrations. It comprises a hood for attachment to the exhaust pipe, a suitable length of flexible tubing and means for securing the pipe to the main air port of the carburetor.

The size of the tubing conducting the heated air is important and while flexible piping could be attached by anyone familiar with it, the desired results might not be secured. The Breeze company conducted a series of tests before marketing its product, the experimentations including all types of motors and carburetors, and by giving the make of vaporizer, size, model and year of the car, the proper size is assured the purchaser.

The hood device is easily attached, being equipped with threaded bolts, which when removed permit of slipping the hood over the exhaust pipe. The hood is kept away from the exhaust member by upset brass pieces. This space

Digitized by Google

permits the drawing in of primary air which is heated before it passes to the air intake of the carburetor. It is held that greater suction is possible because of the tubing.

Where there are two air intakes, an auxiliary and a main, and the latter contains the gasoline jet, the hot air pipe is attached to the main air permanently by a suitable fitting. Where the main and auxiliary air are taken through one port a larger tubing is required, for example, with the Schebler shown at A. On the 1.25-inch model D, and where the main and auxiliary air ports are combined, tubing of 1.25-inch size is utilized.

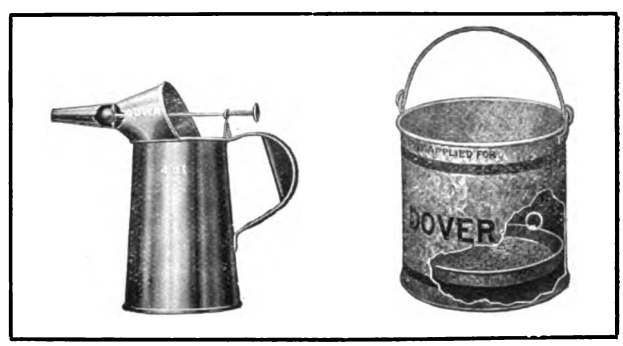
A quality of the hot air intake device, in addition to making for successful carburetion, is that the entrance of dust or dirt is prevented. Some early designs of cars do not include a pan or undershield, the absence of which exposes the carburetor to foreign elements, allowing raw air to be drawn in and affecting vaporization. It is held that starting is aided in that a greater suction of air is made possible by the use of the tubing and that after the first few explosions hot air is drawn over the spraying nozzle.

GARAGE AND TOOL EQUIPMENT.

DOVER SOAP ECONOMIZER.

A device that will appeal to owners caring for their own cars is the new Dover soap economizer brought out by the Dover Stamping & Manufacturing Company, Cambridge, Mass. It is made in two sizes, that for the owner being 10.5 inches high and 10 in diameter, holding about 13 quarts. The garage size is 12 by 12.5 inches and holds 25 quarts.

As will be noted by the accompanying illustration, which depicts a section of the wall cut away to show the construction, a perforated disc or pan member, having a concave surface uppermost, is placed within the vessel. It is provided with convenient ring for removal and replacement.



To utilize the soap economizer it is filled one-quarter or one-third full of soap and the disc member replaced with the concave surface uppermost. The pail is then filled with water. Its advantages are: Economy of soap, keeps the sponge clean as well as saves wear and tear upon it; and the soap is always ready for use, saving time.

The device is constructed of heavy steel, galvanized, and every seam, edge and crevice is coated, making them absolutely tight and rust proof. The soap economizer was invented by a practical garage man and has been adopted by a number of leading garages.

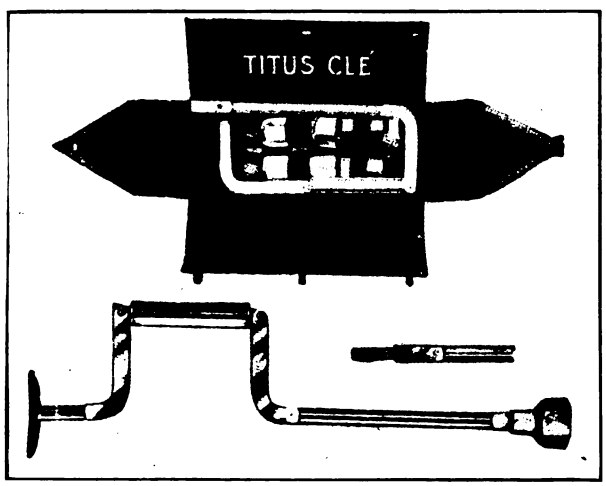
DOVER MEASURE-FUNNEL.

Many cars have the oil tank or reservoir so located that the measure must be tipped so that the lubricant will run out before the filler hole of the tank can be reached. Under these conditions when the reservoir is filled the spout of the measure must be withdrawn and cannot be canted quick enough or back far enough to prevent the continuance of the flow of oil until the same has been raised above the level of that in the tank. With an ordinary measure not only is considerable of the fluid wasted, but the lubricant drips over the motor and other parts, making cleaning necessary.

To overcome these troubles the Dover Stamping & Manufacturing Company, Cambridge, Mass., has brought out a combination measure and funnel having an automatic attachment, the construction and operation of which are made clear in an accompanying illustration. It will be noted that the spout is fitted with a ball member. This brass valve is ground to an oil tight seat and normally is retained upon it by the spring.

At Left, New Dover Saval Combination Measure and Funnel, Equipped with Automatic Shut-Off Attachment; at Right, Dover Soap Economizer, Saving Soap and Sponges, Making Easy Washing of Automobile.

In using the measure it is employed in the usual manner and with the ball held upon its seat, preventing the flow of lubricant until the push button is moved forward. The movement opens the valve and permits the flow of lubricant, which may be stopped instantly by removing the pressure upon the button member. This may be actuated easily by the thumb or finger.



Digitized by Google

The measure and funnel are constructed of high-grade material, copper plated, and in three sizes, containing one, two and four quarts, respectively. They are moderately priced and will save their cost in one season in economy of lubricant.

MOSSBERG TITUS CLE.

There are many places about the chassis of the motor car which cannot be reached easily with the ordinary monkey or S wrench. This is especially true of the power plant. The Frank Mossberg Company, Attleboro, Mass., is manufacturing an equipment termed the Titus Cle and it is a simple and practical form of folding socket wrench with which are seven mottled, case hardened, pressed steel sockets and a screw driver.

As will be seen in the accompanying illustration the wrench folds up and when not in service may be carried in a small, compact canvas case. With it adjustments may be made easily and quickly as the nut or bolt to be tightened or loosened may be reached without trouble or without the operator injuring his hands.

The Mossberg Titus Cle, a Handy Tool for Adjusting Parts, and Useful in Grinding in Valves.

The socket sizes are .53125, .59375, .65625, .8125, .90625 and 1.09375-inch respectively. One of the qualities of the Titus Cle wrench is that it may be utilized for grinding valves by fitting the screw driver attachment. When being employed as a wrench, considerable leverage is secured through the length of the tool.

The Albany Automobile Dealers' Association, Albany, N. Y., has announced that its annual automobile show will be held Feb. 15-22.

PANAMA-PACIFIC EXHIBITION.

Effort Being Made to Interest Industry in Special Exhibition of Automobiles.

Capt. A. C. Baker of the exhibits committee of the Panama-Pacific International Exposition to be held at San Francisco, Cal., in 1915, states that if the eastern motor car manufacturers so desire, arrangements will be made whereby they will be given space together to exhibit their different models. The industry will have an opportunity to hold one of the largest automobile shows in its history.

One of the plans proposed is to allow the use of a special structure in which the space would be given free. Provision is made for such a building in the plans of the exposition grounds, but in order to secure it the option must be closed speedily. Otherwise, if it should be decided later that one were desired, it would be necessary to accept a site much less ideal. The building would probably comprise 250,000 square feet of space and a special automobile division will be created to have supervision of the exhibition.

FORD CANADIAN PRODUCTION.

Plans Now Under Way Looking Toward Greatly Increased Business During Coming Year.

The Ford Company, Walkerville, Can., owned by the Ford Motor Company of Detroit, maker of Ford cars, has doubled its business each year since 1909, and work is now under way to still further enlarge the plant. A large gas producer is being installed, the machine shop is being greatly enlarged and every other department is being increased in proportion. It is estimated that the output the coming year will be 15,000 cars.

The company has purchased 50 acres of land at Sandwich, Ont., near Walkersville. No definite decision has been reached as to what use the land will be put, but if the business continues to increase it is probable that large assembling plants will be erected, in which event the present factory would all be used as a machine shop.

R. H. Morse and family of Flint, Mich., recently completed a 3200-mile tour to Portland, Ore., and return in their 1909 Buick car, made by the Buick Motor Company, Flint, Mich., without any mechanical trouble. Mr. Morse is enthuiastic over the showing made.

ROAD TREATMENT IN MASSACHUSETTS.

AT THE convention of the American Road Builders' Association in Cincinnati, O., early in the month one of the principal speakers was Col. William D. Sohier, chairman of the Massachusetts highway commission, his subject being "How to Treat Roads." Motorists will be inclined to disagree with some of the points brought out by Col. Sohier, but they cannot help but be interested in his address, which is presented in part as follows:

The Massachusetts highway commission in 1909 had a census taken upon the state highways at 238 stations, scattered throughout the state, and in 1912 a similar traffic count was made at 156 stations. To illustrate the results, on the Revere parkway in August of this year, there was an average of 64 horse drawn vehicles daily and 1808 automobiles and 97 per cent. of the travel was automobiles; whereas in Somerville the average of horse drawn vehicles was 440 and the number of automobiles only 164, or 27 per cent. of the total, and yet the traffic at both places would go into the total and help to make the average. Obviously, however, the two roads have such different traffic to carry that different material and methods must be used.

It has been found, too, that the total number of vehicles using the road has increased 42 per cent. in three years. This is not the most significant feature for the roadman, however. The change in the traffic is what we must consider and prepare for. Motor vehicles have increased in numbers on the average 131 per cent., from 96 to 222 a day; on the other hand the teams have decreased on the average 14 per cent., from 151 to 129 a day, making net increase only 42 per cent.

Equally interesting for the future may be the fact that while we had almost no motor trucks in 1909, in 1912 we had an average of over 11 a station a day, or about 3 per cent. of the total traffic in numbers and much more in weight. The increase in motor trucks between our August and October census was notable. The average number of vehicles at each station decreased 72 a day, or 18 per cent., while the number of motor trucks actually increased 4 per cent.

On the state highways near the cities we often found from 50 to 75 trucks a day, and usually from 15 to 30. On some roads motor trucks constituted over 16 per cent. of the total number of vehicles and actually outnumbered touring cars.

Naturally, automobiles have brought in travelling, and put many places upon the map which were not there before, especially in New York and New England, where the woods, lakes, mountains and seashore furnish the great recreation and vacation resorts for the whole country. In the town of Salisbury, on the main line to the large New Hampshire resorts, the new and better road has increased the travel. In 1909 we found an average of 185 vehicles a day passing over this road; in 1912, 586—an increase of 217 per cent. in three years.

On Cape Cod in Massachusetts there is nothing but sand. The roads formerly were sand, and were deeply rutted, and travel was difficult. First, many of these roads were more or less hardened and greatly improved by using clay, or even loam, to help pack the sand. This worked reasonably well with very light traffic, but in a long dry spell the roads often went to pieces. Now the main lines on Cape Cod are mostly state highways, although often the town paid a large part or the whole of the cost of building them. Many of these roads are now macadam. The automobile traffic increased so much that they were rapidly being destroyed and we have had to oil most of them; again using motor vehicle fees.

Here again the increase in traffic shows how a good road attracts travellers. A sand oil road replaced a sand road and here is the result:

In one town in 1909 there were 118 vehicles, of which only 41 were automobiles; in 1912 (only three years later) there were 331 vehicles and 142 of them were automobiles. The total traffic had increased 18 per cent., but—mark this—over 100 more automobiles passed there every day. The tourist had arrived and was spending his money.

After all, however, it is not numbers which tell the story, it is weight, and it is not weight alone, but the vehicle by which it is transported, whether by horses or by motor. It is not the tractive power alone that makes the difference, but the tires which support the vehicle; whether iron or rubber comes in contact with the road; whether the vehicle is pulled over the road or propels itself, and thus pulls upon the road surface.

The weight of the automobile traffic has increased 160 per cent. in three years, while the weight of horse drawn vehicles has actually decreased 8 per cent. in the same time. While this is true, note what happened—the motor truck has come in with an average number of trucks of 11.5 a station, and their weight is nearly 72 tons a day. Weight of teams decreased 12 tons a day.

Digitized by Google

Trucks came in with a weight of 72 tons a day—making good the loss in team weight six times over.

The experience in Massachusetts and elsewhere has shown conclusively that large numbers of swiftly moving automobiles cannot successfully be carried over a water bound macadam road or over a gravel road. Such a road becomes ravelled very rapidly, rutted and disintegrated. Our traffic studies indicate that from 50 to 100 automobiles a day make the use of some dust layer or binder necessary.

With the motor traffic which we already have, we are forced, we think, both for economy and for efficiency, where a road has heavy team traffic as well, to adopt in construction or resurfacing some form of bituminous mixture for the upper two or three inches of the road surface, at least, or some stronger road like concrete.

We have saved many miles of our old roads by spreading a coat of asphaltic oil—light or heavy—or tar, over them. Today some asphaltic binder or dust layer has been used on over 80 per cent. of our state highways, and the only roads on which it has not been used are those located in the country districts where there is very light traffic. This year we have used nearly 2,000,000 gallons of bituminous material in construction or maintenance. Over 800 of the 930 miles of our state highways have received some form of bituminous treatment.

We have a good many miles of old macadam road which have been saved and maintained by one-half gallon of hot asphaltic oil spread upon each square yard of surface and properly covered with sand and pea stone or gravel. These roads have, many of them, worn three years, and in their fourth year are still in good condition. The traffic study shows that it is not the number of teams, but heavy teams—two or more horses, heavy loads on narrow tires—that cause the failure.

The failure of roads treated with heavy oil has occurred on a few miles of road at certain places where it was clear that heavy horse drawn teams were responsible. One Gloucester road covered with a hot oil blanket, was rutting and wearing out quickly in 1909. A coal team was passing to some hotels three or four times a day during the summer (carrying six or seven tons of coal on narrow tires). A motor truck was substituted for the coal team, and the surface of the road, which had been oiled, was again in good condition. It has worn three years and now only needs patching.

A hot oil blanket surface, made of a good asphaltic oil, will be economical and will carry large numbers of automobiles at high speeds (over 1000 a day in summer) for several years, will carry large numbers of light teams (500 a day), and quite a number of motor trucks (50 or so a day), but will be destroyed by a large number of heavy teams, especially with narrow tires.

When these surface treatments fail, as they will where the traffic is extremely heavy—meaning heavy in weight of vehicles, not numbers of vehicles—then you must select some more permanent form of construction and reconstruct your road as soon as possible. It will prove to be true economy in the end, and the end is not far.

With much hesitation I have prepared a tabulation showing as nearly as I can the results we have observed after four years of experience with bituminous materials, comparing these results with the traffic going over the road in 1909 and again in 1912. The estimates are made on a standard road 15 feet in width, with a three-foot gravel shoulder on each side.

Average Daily Traffic.

A good gravel road will wear reasonably well and be economical with an average of from 50 to 75 light teams; 25 to 30 heavy teams, one horse; 10 to 12 heavy teams, two or more horses, and 100 to 150 automobiles, but needs to be oiled, with more than 150 automobiles.

Oiled gravel is fairly good; either hot or heavy cold oil .5-gallon coating (cold oil must be used yearly), when used by 75 to 100 light teams; 30 to 50 heavy teams, one horse; 20 heavy teams, two or more horses, and from 500 to 700 automobiles.

Water bound macadam will stand with from 100 to 150 light teams; 175 to 200 heavy teams, one horse; 60 to 80 heavy teams, two or more horses, but not over 75 automobiles at high speed.

Dust layer will prove serviceable on such macadam with from 50 to 100 automobiles.

Macadam will then stand (but the stone wears, of course), with from 300 to 500 automobiles.

Water bound macadam with hot oil blanket coat will be economical with 250 to 300 light teams; 75 to 100 heavy teams, one horse; 25 to 30 heavy teams, two or more horses; and 1400 automobiles.

The same will stand at least 50 motor trucks, and probably more.

But will crumble and perhaps fail with over 100 heavy teams, one horse, and 50 heavy teams, two horses or more, on narrow tires (loaded farm wagons, ice and wood teams, etc.).

Water bound macadam with a good surface coating of tar will stand with 30 to 50 light teams; 25 to 30 heavy teams, one horse; 10 to 15 heavy teams, two horses or more; and 1800 automobiles.

William J. Hardwick of San Francisco, Cal., 78 years old, is an enthusiastic motorist and is seen daily in the streets of his city driving his own machine. Mr. Hardwick first became interested in motoring four or five years ago and at that time entered a school to gain both a theoretical and practical knowledge of automobiles. He drives a Regal machine, made by the Regal Motor Car Company, Detroit.

SIX-WHEELED COLUMBIA CAR.

Converted 1906 Model Has Seen Two Years of Service as a Mountain 'Bus.

An accompanying illustration presents a reconstructed 1906 Columbia model, made by the Columbia Motor Car Company, Hartford, Conn., which has been in service with the Lake County Automobile Transportation Company of Highland Springs, Cal., for the past two years. The addition of the extra pair of wheels was occasioned by the desire to solve certain problems which confronted the concern in operating a motor 'bus route over the mountainous roads of that district.

The company maintains a transportation line between the railroads and the resorts in the mountains, and the object sought was that of carrying large parties with a few conveyances. The machine is called upon to make extremely sharp turns, and it was found that the usual four-wheel 'bus of long wheelbase experienced difficulty in this work. The old Columbia chassis was purchased and another set of wheels was added. This necessitated lengthening the body, so as to accommodate 14 passengers, and the forward end of the new section was hinged back of the driver's seat. The wheels were arranged so as to steer both front and rear. After being in service for two years this seven-year-old car was overhauled recently, worn parts being replaced, and it is now ready for another season's work.

Six-Wheeled Converted Columbia Car in Transportation Service Among California Mountains.

PRESENTED WITH LOVING CUP.

Flint Friends of President Nash of General Motors Company Testify to Their Esteem.

C. W. Nash, the newly elected president of the General Motors Company, to succeed Thomas Neal, resigned, was presented with a loving cup by his friends in Flint, Mich., where he has been general manager of the Buick Motor Company the past two years, at a recent banquet given by the Flint Board of Commerce. The event was attended by 200 men, including guests from New York, Chicago and other metropolitan centres.

The speakers reviewed Mr. Nash's career from the farm to his present position and testified to the esteem in which he is held by his business associates. A few days later Mr. Nash was the guest of honor at a banquet in Detroit, given by the officers of the General Motors Company.

TO VISIT NEW ENGLAND.

Movement on Foot to Bring Glidden Tourists from New Orleans to White Mountains.

There is said to be a movement on foot to have the reliability contest of the American Automobile Association, otherwise known as the Glidden tour, for 1913, run from New Orleans to New York or Boston, instead of from Detroit to New Orleans. The failure to hold the event this year is pointed to as a sufficient reason for making the change.

In connection with this, it has also been suggested that the run be extended to the White mountains, inasmuch as many southern people annually journey to the North and the various mountain resorts. The route contemplated would be from New Orleans to Baton Rouge, Jacksonville, Montgomery, Atlanta, through the Carolinas to Charlottesville, Washington, Baltimore, Philadelphia, New York, Boston and the White mountains. This would be a trip of about 2000 miles and one on which the cars and participants would encounter all kinds of roads and grades. It is remembered, of course, that several of the early Glidden tours visited the White mountain regions.

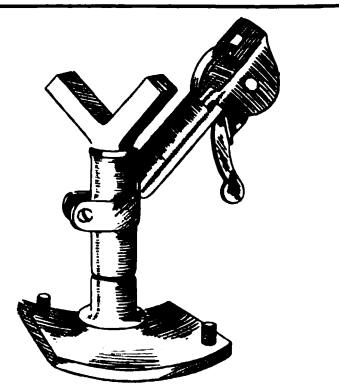
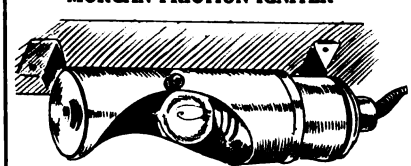
NEW AND NOVEL ACCESSORIES THAT APPEAL TO MOTORISTS



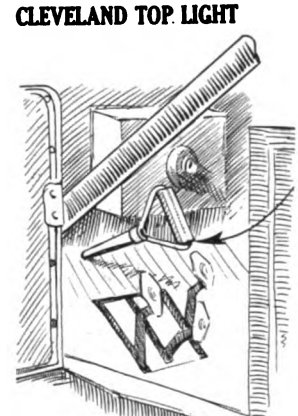
The Morgan Friction Igniter is manufactured by B. Morgan, Newport, R. I., and although designed for lighting the acetylene lamps of the motor car, it also may be utilized with the household illuminating gas. It is very compact and is attached to the acetylene burner by a screw actuated clamp which slips over its base. The igniter is operated by a lever which when lifted and allowed to snap back, produces a shower of sparks in the path of the escaping gas. The friction material is inexpensive and may be replaced when worn.

—— ★ ——

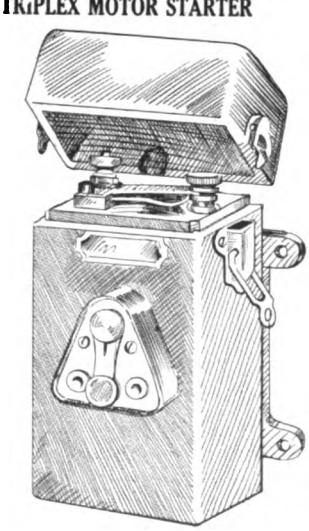


The Cleveland Top Lamp, manufactured by the Cleveland Electric Storage Battery Company, 116 Market street, St. Louis, Mo., is an electric member for lighting the tonneau of the motor car equipped with a canopy top. The bulb is contained within a sturdy metal casing which is secured to the bow of the top. A shutter is provided, affording protection to the bulb when the top is folded. The lamp comes complete with suitable length of flexible cord, and is inexpensive.

—— ★ ——



The Triplex Motor Starter is the product of the Bremer-Wilson Manufacturing Company, 1256 Michigan boulevard, Chicago, and is designed especially for model T Ford automobiles. It operates on the mechanical principle, a handle being conveniently located at the base of the dash and within easy reach of the driver. The starting mechanism is secured to the crankshaft of the motor and is actuated by a chain carried in a suitable casing and connected to the handle member. By pulling the latter a quick movement is imparted to the crankshaft and in the same direction as when the engine is rotated by the usual starting crank. The mechanism is such that a back fire breaks the contacts. It is pointed out by the maker that the simplicity of the design is such that the device may be installed in an hour and that no drilling or mechanical work is necessary. The fitting does not interfere with the usual starting handle, which may be employed in the ordinary manner when desired.



MORGAN FRICTION IGNITER

CLEVELAND TOP LIGHT

TRIPLEX MOTOR STARTER

NEW YORK MASTER VIBRATOR

—— ★ ——

The New York Master Vibrator is manufactured by the New York Coil Company, 338 Pearl street, New York City, and also is designed for model T Ford automobiles. The vibrator is of special construction and the maker states that the condenser is unusually powerful. The vibrator synchronizes the spark and is connected in series with the regular coil, the vibrators of which are short circuited. This eliminates the trouble of adjusting extra units and makes for more power in that accurate timing of the spark is made possible.

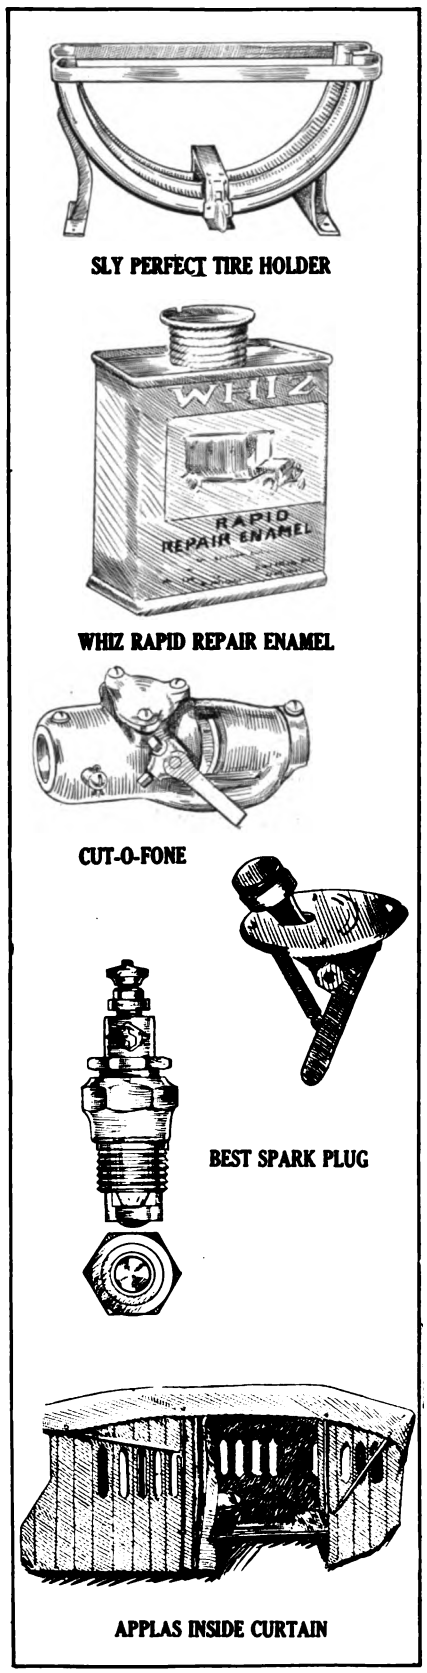
—— ★ ——

The Sly Perfect Tire Holder will appeal to the discriminating motorist as its design is such that it may be attached to the running board, instead of the body, thereby saving the latter from disfiguring marks by screws or bolts. The device is sturdily constructed, is neat in appearance and the holder proper is so shaped as to retain the shoe in an upright position. The use of straps, etc., is eliminated, the tire being locked by a strong metal hasp provided with a self-locking toggle member. The brackets support-

Digitized by Google

ng the holder are neatly constructed and are bolted to the running board. The Sly Perfect tire holder is made in single and dual form and is inexpensive. Smalley Daniels, 247 Jefferson avenue, Detroit, is sales agent.

★



Whiz Rapid Repair Enamel is manufactured by the R. M. Hollingsworth Company, Camden, N. J., expressly for quickly repairing the enamelled parts of automobiles and motorcycles. Its function is to conceal disfigurements which would otherwise detract from the appearance of a car, and when applied to wood, metal or upholstery, dries in five minutes, leaving a hard, smooth and water proof surface. It comes in half-pint cans.

★

The Cut-O-Fone is marketed by the Mayo Manufacturing Company, Chicago, and is a combination signalling device and cut-out. It is light and compact and may be installed easily, as bushings are supplied for fitting to pipes of different diameters. A sliding balanced piston valve, controlled by a single foot button, permits the use of either the alarm or cut-out. The control member is located near the clutch pedal, and when the button is pressed half way down, the cut-out is opened and locked automatically. When fully pushed down the signal is operated, but upon removing the foot the valve automatically registers for the cut-out position. When the cut-out is not desired the lever is pushed forward.

★

The Best Spark Plug, manufactured by the Best Ignition Company, 200 West 64th street, New York City, is held by the maker to be oil proof through the utilization of a button head terminal which, by reason of the heat it retains, dries up any oil that may be thrown upon it. It is claimed that the head acts as a condenser and produces an unusually large spark. The porcelain is protected against the shock of explosion by the button member and the entire plug may be disassembled easily when desired. The plug is constructed of high-grade material and long life as well as efficiency are emphasized of it.

SLY PERFECT TIRE HOLDER

WHIZ RAPID REPAIR ENAMEL

CUT-O-FONE

BEST SPARK PLUG

APPLAS INSIDE CURTAIN

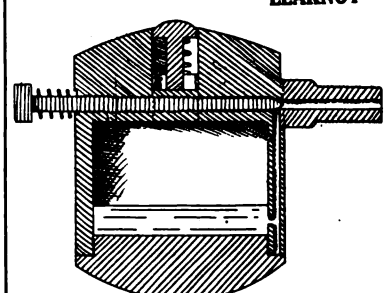
★

The Applas Inside Curtain is produced by the Applas Curtain Company, 601 Ford building, Detroit, and in addition to being very neat in appearance provides means for completely and quickly enclosing the body, thereby protecting the occupants against the weather. It is accordion pleated and suspended from nickel plated rods which extend from bow to bow. When not in service the curtains are held flatly against the underside of the bow, entirely out of the way, preventing breakage of the celluloid lights. A ring is attached to each pleat, permitting sliding, which operation folds it automatically. Means are provided for securing the curtains when in position, as well as for attaching to the body. A multiplicity of windows make for excellent lighting of the car's interior.

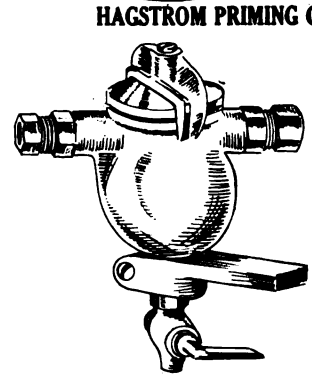
★

Leaknot is a liquid, water proof rubber dressing manufactured by the National Rubber Company, St. Louis, Mo. It is adaptable for coating leather, such as the top or upholstery, and the maker holds that it is colorless, odorless and will not injure the material, which it rubberizes. One of the qualities emphasized of the preparation is that it softens leather.

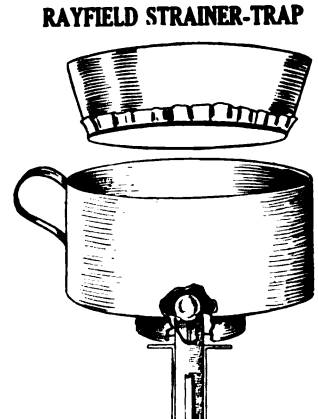
Digitized by Google



The Hagstrom Priming Cup, produced by the Hagstrom Bros. Manufacturing Company, Lindsborg, Kan., has been improved by the addition of a needle valve like member which may be adjusted to enrich the mixture or weaken it as may be desired. The cup is designed for attachment to the intake pipe and is a priming device in that gasoline is inserted through a ball check opening at the top. When the motor is cranked the suction of the piston draws in a rich mixture as the fuel is vaporized by the carburetor attachment. The motor may be run with this rich mixture until the cylinders become warm and features of the cup are that there are no levers to loosen or open and that the needle valve member may be closed or opened as desired. The cup is very compact and is constructed of high-grade material.



★



The Rayfield Strainer-Trap is produced by the Findeisen & Kropf Manufacturing Company, maker of the Rayfield carburetor, and is installed in the main fuel line between the source of supply and the vaporizer. It is a valuable component of the carburetion system, in that it not only separates water and foreign elements from the fuel, but prevents them from reaching the carburetor and creating trouble. The gasoline enters at one end, flows directly to the bottom of the trap, and in rising to pass out, passes through a very fine metal screen. All accumulations are left in the bottom and may be removed by means of a petcock. A brace is provided with the strainer for attaching to any convenient frame or other car member. The device is five inches high and 2.5 wide, and is constructed to take

LEAKNOT

HAGSTROM PRIMING CUP

RAYFIELD STRAINER-TRAP

DOVER SAVAL FUNNEL

.25, .3125 or .375-inch outside diameter tubing. It is made of brass, nicely finished and is moderately priced.

★

The Dover Saval Funnel produced by the Dover Stamping & Manufacturing Company, Cambridge, Mass., is practical for the garage and private owner and is well adapted to motor boats. It makes for economy of fuel in filling the tank, as the flow of the fluid is automatically and positively cut off when the funnel is lifted from the filling hole of the tank. This prevents waste and has the added advantage of safety. The funnel is provided with a large hoop on the base which rests firmly on the bottom of the tank, eliminating the possibility of tipping. The hoop is equipped with apertures, venting the spout and preventing it from becoming air bound. This and the ample size of the spout allow the contents of the funnel to be emptied in a very few seconds. A new special, extra large hoop extends the entire depth of the funnel, and serves to hold a piece of chamois the extreme size of the funnel in the bottom, the whole resting on two wires to prevent sagging. This construction gives a maximum capacity of fuel above the strainer. The Saval funnel comes complete with chamois, is galvanized and is designed to withstand severe service.

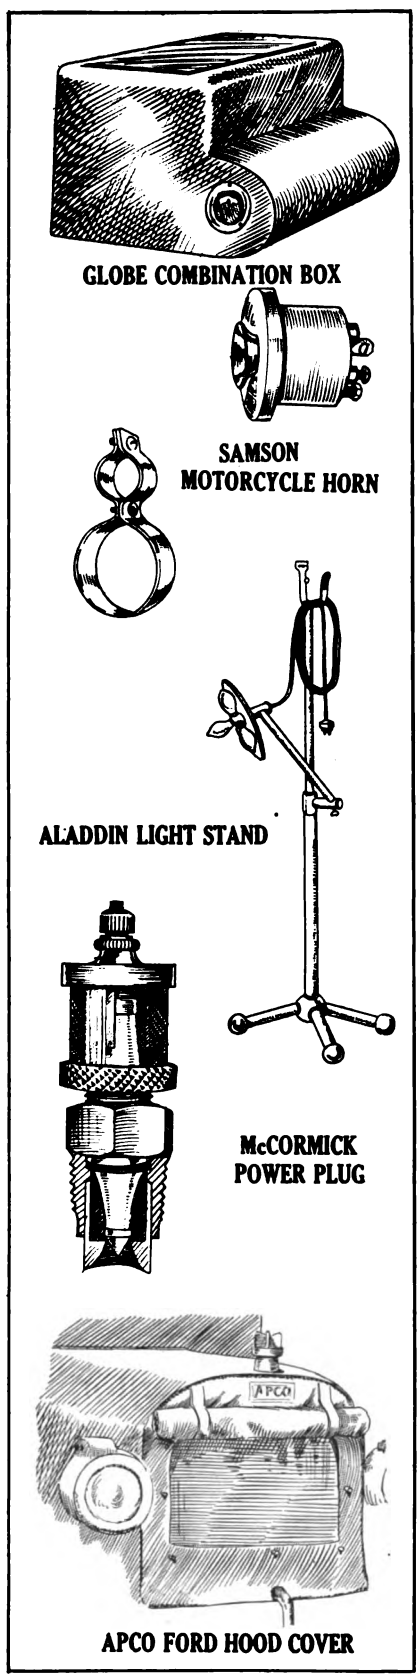
★

The Globe Combination Box, manufactured by the Globe Machine & Stamping Company, Cleveland, O., will appeal to motorists utilizing a gas tank for lighting purposes, in that the tool or battery box is in combination with the acetylene member. The design of the box is such that the tank

Digitized by Google

is not only concealed from view, but it is locked against theft. It may be utilized when desired as the nipple member protrudes, but is sheltered by a hood which also serves to prevent clothing from catching upon it. A sight window is incorporated for reading the tank gauge. The box may be installed with the tank at the front or rear, or upon the running board, is compact in form, and the lid of the tool or battery member is provided with a self-locking toggle member and two suit case catches.

—— ★ ——



The Samson Motorcycle Horn is manufactured by the American Electric Company, Chicago, and current is supplied by two or three dry cells. It is a very neat and compact signalling device, and produces a large volume of sound, upon pressing a button. A clamp is provided for mounting. The device is nickel plated and comes complete with sufficient length of flexible cord, and a push button as well as a clamping member.

—— ★ ——

The Aladdin Light Stand, marketed by the I. J. Smith Manufacturing Company, 4241 Park avenue, New York City, is designed for the wash stand or repair shop and the lighting member may be utilized as a hand light if desired. The stand is adjustable as to height and the arm carrying the reflector may be set at any desired angle. The outfit comes complete with suitable length of flexible cord, also a socket plug for attaching to main line.

—— ★ ——

The McCormick Power Plug, produced by the McCormick Manufacturing Company, Dayton, O., is novel in operation in that a large number of high frequency sparks are produced

and these are constantly moving around the terminals. The sparks take place in the sparking chamber having a single restricted opening. During compression the gas is segregated in this space and when exploded a flame is projected into the cylinder. The spark gap is circular in form and all points are charged with the same potential and at the same time. When the gap is broken down, that is, when the discharge takes place, all points discharge simultaneously, producing the shower of sparks. It is held by the maker that greater efficiency is obtained from the motor through a more complete and quicker burning of the mixture, and that sooting or carbon is prevented. It takes the place of the regular spark plug and is made in three sizes.

—— ★ ——

The Apco Ford Hood Cover is marketed by the Auto Parts Company, Providence, R. I. It is designed to keep the water in the circulation system warm and the motor at the same time. This makes for easy starting when the machine has been exposed to the cold as the cover completely envelopes the hood and radiator, retaining the heat for a considerable period. It is constructed of rubber cloth, well stitched and padded with felt, and is equipped with an adjustable curtain. The cover may be left on all winter, thereby protecting the power plant from rain or sleet, and being neatly constructed does not detract from the appearance of the machine. The curtain may be lowered or raised as desired and is secured by curtain fasteners. The device is moderately priced and replacing the blanket prevents possible theft of that member when the car is left alone.

THE SHOW SEASON.

Although a large number of manufacturers announced their 1913 models some little time since, it is true this year, as it has been in past seasons, that much has been reserved for presentation at the annual shows—that period which has been set aside by the industry for stimulating business. Full opportunity will be afforded prospective purchasers to examine the various productions and to make comparison of their respective merits. The annual exhibition has become an established institution and in no other manner is it possible to secure the same information regarding the new offerings.

The situation this year is slightly different, in that the National Association of Automobile Manufacturers is lending its support to the so-called dealers' shows in various sections of the country. Even the national display in New York City is more representative of the industry as a whole than heretofore. Those who plan to visit the Madison Square Garden and the Grand Central Palace during the two weeks devoted to the presentation, first of the pleasure cars and then of the mechanical transports, will find the product of practically all the leading manufacturers in the country. It will be an opportunity never afforded before in the East, except at the Boston shows which have been held under the auspices of the local dealers.

Sufficient already has been made public to indicate that 1913 is to be what is termed an equipment year. This means that car manufacturers have anticipated the demands of the motoring public by fitting their machines with what is regarded as the necessary accessories and appointments. This is certain to excite special interest in the accessory booths and it follows that the list of such equipment on display this year will be greater than ever.

BALTIMORE'S PROPOSED ORDINANCE.

Every automobile owner can appreciate the situation confronting the motorists in Baltimore, Md. The state already demands a license fee based upon the horsepower rating. In addition the owner must pay personal taxes on his machine, a burden which is eliminated by law in other states, as the registration usually applies in lieu of such taxation. Now the city seeks to impose another license fee, quite as large as that demanded by the commonwealth.

The Automobile Club of Maryland is doing good work in calling attention to this proposed injustice. Every motorist in the state should be interested, since it is quite proper that the statute should be so amended that such local licensing would be prohibited. And at the same time the club will do well to seek the passage of an amendment eliminating the personal taxation as well.

AS TO LICENSING DRIVERS.

The matter of the reckless driver will receive more or less attention in several states during the coming legislative season. Suggestions made by a member of the Chicago Automobile Club have secured widespread attention. This man frankly admits that some of his proposed regulations would be impossible of enforcement, particularly the prohibition of driving on the day a drink of intoxicants has been taken.

His suggestion concerning the examination

Digitized by Google

of applicants for driving licenses may be held to possess some merit. He would have a physical examination for color blindness and correctness of vision, ability to hear, and to show freedom from defective physique which might render driving dangerous, such as epilepsy, insanity, locomotor ataxia, a bad heart and a number of other conditions which might render the operator dangerous to other traffic.

As to the examination for ability to drive, he would have this not so much mechanical as on the real question as to whether or not a person knows how to drive. In addition he would have the new operator shadowed on the road while driving, and without his knowledge.

LIMITING WEIGHT OF TRUCKS.

Already it is being brought home to those interested in the progress of the commercial vehicle industry that a serious mistake was made by the Massachusetts legislature early in the year when it declined to settle the question of limiting the weight of motor trucks using the highways of the commonwealth. It was pointed out at that time that other states undoubtedly would follow the example of Massachusetts in this connection, and it need cause no surprise that the highway commission of New York is engaged upon the preparation of a bill along these lines.

The whole question is one of expediency. Either the commonwealth must proceed at once to build roads and bridges adequate to care for the new form of transportation or the public must suffer because of an attempt to retard progress. The thorough practicability of the automobile, whether for business or pleasure, has been ably demonstrated. The time must come when the mechanical conveyance will solve many of the transportation problems of the country. An effort to curtail its usefulness at this time is simply delaying the inevitable. Sooner or later the public must make the necessary provisions for its general use.

CONCERNING UNIVERSAL LIGHTING.

It is of particular interest at this time to note that the proposition to demand that all vehicles using the highways during the hours of darkness shall be equipped with lights is meeting with decided favor in all sections of the country. Many cities, tired of waiting for state legislation, have passed ordinances covering the matter, and while such commonwealths as have taken action have found it desirable to eliminate well illuminated ways from the provisions of the law, these cities do not appear to be of the same opinion.

The effect of this situation cannot help but be beneficial. From the first the majority of the opposition came from those in the country districts who felt that the new law would impose financial burdens too great to bear. When it is learned by these people, through compliance with the city ordinance, that such compliance not only does not require the expenditure of a large sum, but makes for greater safety for the horse drawn vehicles, it will be a simple matter to secure the passage of a state law covering the matter.

ENFORCING THE SPEED LAW.

Recently, the magistrate in the police court in Toronto, Can., felt compelled to impose a fine upon the driver of a private ambulance because he had disregarded the speed limits in rushing a dying woman to a local hospital. The driver had been informed by the physician in charge that the patient was in a very critical condition and to proceed as quickly as possible. This does not appear to have been the first instance in which ambulance drivers have been fined in this manner in Toronto.

Motorists will agree with all others that reckless drivers should be prosecuted with all possible vigor. It does seem, however, that certain vehicles should have the right of way at all times, and included among these are ambulances and fire apparatus. One of the advantages of utilizing motor equipment is its ability to save time when moments may mean the loss of life or damage to property.

There has been far too much attention paid to drivers who are proceeding at a pace just beyond that specified by the law, and too little to the reckless operator, who usually makes it difficult for the policeman to apprehend him. The proper enforcement of the speed ordinance is an important problem, but it is made no easier of solution by holding up ambulance drivers when engaged upon an act of mercy.

PIONEER AMERICAN GASOLINE AUTOMOBILE.

Conclusion of a Brief Resume of Industry's Progress in This Field--Some of the Earlier Six-Cylinder Cars---Development of the Present Pierce-Arrow.

IN VIEW of the present interest concerning six-cylinder models, it may be noted that the first six-cylinder season was that of 1904, since it would appear that in that year the pioneer American six was produced and marketed. This statement must not be taken as indicating that the subject had not been broached previous to that date, and it also is true that the first car of this type to be made and sold in this country was not of American design.

At one of the early New York shows in Madison Square Garden the Automobile Company of America, which made the Gasmobile, displayed what is regarded as the first six-cylinder car to attract special attention. The standard Gasmobile was fitted with a three-cylinder engine which

The First Six-Cylinder Car Marketed in This Country, Made by Napier Motor Car Company of America.

was placed at the rear of the chassis, and in this particular car two of these three-cylinder units were united and set up vertically in the front.

E. R. Thomas of Buffalo, N. Y., also had a three-cylinder car, and in at least two of these machines he coupled two of these units together. It is stated that these machines were utilized largely for advertising purposes and were termed racing cars. It is not understood that any particular effort was made to place these machines on the market.

The Original Napier.

It appears, however, that satisfactory results were not obtained until the arrival of the original Napier six from England about 1904. This car was imported by Charles J. Glidden of Boston, donor of the Glidden trophy, for George H. Morrill of Norwood, Mass., the man who was mentioned in the first article in this series as having purchased one of the early Duryea wagons.

Subsequently, the Napier Motor Car Company of America was organized and located at Jamaica Plain, Mass., where the first six-cylinder cars made in America were produced. An accompanying illustration shows the first machine that was manufactured in this factory, and it must be admitted that it was a very creditable production, even when compared with the present day sixes.

About this same time the Smith brothers, now of the Springfield Metal Body Company, Springfield, Mass., were interested in the Auto-Motor, a six-cylinder design which succeeded a four-cylinder car that appeared earlier. This does not seem to have resulted in a complete success, however, and the effect it may have had upon the decision of the Stevens-Duryea Company of Chicopee Falls, Mass., to investigate the possibilities of the six is open to question.

The Stevens-Duryea Six.

J. Frank Duryea, who it will be remembered was associated with his brother, Charles E. Duryea, in the production of Duryea wagons in Springfield and Chicopee Falls previous to 1897, went to Boston and studied the new Napier. He was at this time associated with the Stevens-Duryea Company, and as a result of this trip the Stevens-Duryea six made its appearance.

This may be regarded as the pioneer American six, designed and built in this country, although it was influenced in a large degree by the Napier. An accompanying illustration shows one of these first Stevens-Duryea sixes on the beach at Old Orchard, Me. The young man at the wheel is Ruel Smith of Attleboro, Mass., and that at the extreme right of the picture, in the tonneau, is Harold S. Blake, son of the James E. Blake mentioned in an earlier installment as having perfected the plans of Edward F. Scholze for the original four-cylinder car made in America. As a boy, Harold S. Blake drove this pioneer four-cylinder machine many miles and he has long been connected with the industry in an experimental way.

Digitized by Google

Ford's "Little Six."

In 1906, Henry T. Ford of the Ford Motor ompany, joined the ranks of the six-cylinder ad-

)ne of the Early Stevens-Duryea Sixes, the First of This Type to Be Designed and Produced in America.

rocates. At present, much is heard concerning he so-called "little sixes." This term may be ariously interpreted. With some manufactur-ers it means a car fitted with a six-cylinder mo-or rated at less horsepower than those formerly produced by it. With others it indicates a road-ster chassis similarly fitted. Ford appears to nave been a pioneer producer of a little six, if it be admitted that a six-cylinder roadster is en-titled to that designation.

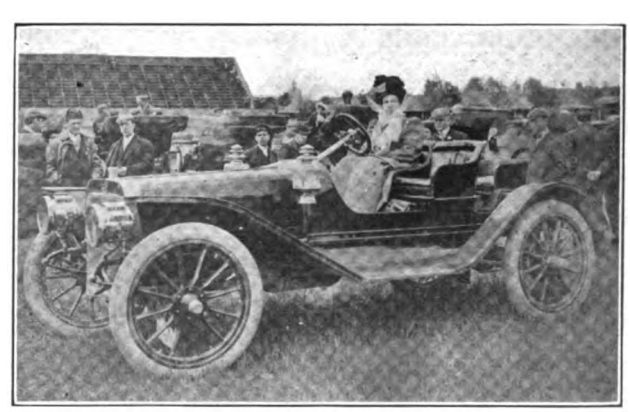
Two types of bodies were fitted to the same Ford chassis, a touring car and a roadster. The latter had a rumble seat and thus afforded seating capacity for three persons. The motor was rated at 45 horsepower, and that it was capable of giving good service is indicated by the fact that several of these Ford sixes are still able to make 50 miles an hour over the road.

The Ford six of 1906 was continued in 1907 with but slight modifications. It was dropped in 1908, not because there was no demand for this particular chassis, but because the designer decided to devote all of his time and attention to the production of but one model, and selected the four-cylinder engine as best meeting the needs of the general public.

Winton Sixes Exclusively.

Alexander Winton of the Winton Motor Carriage Company, Cleveland, O., is regarded as the pioneer builder of six-cylinder cars exclusively. In 1907 he was convinced that this type of machine was the most desirable and dropped the models he had previously brought out. In this connection it may be added that Winton produced the first eight-cylinder car in America in 1903, this being the Winton Bullet, a special racing machine, which was driven successfully for three years by Winton himself, Barney Oldfield and Earl H. Kiser.

Another eight-cylinder racing machine was designed later by J. D. Maxwell and built at the factory of the Maxwell-Briscoe Motor Company in Tarrytown, N. Y. And about the same time Maxwell also made a special 12-cylinder car. It does not appear that these were regarded as successes, however.



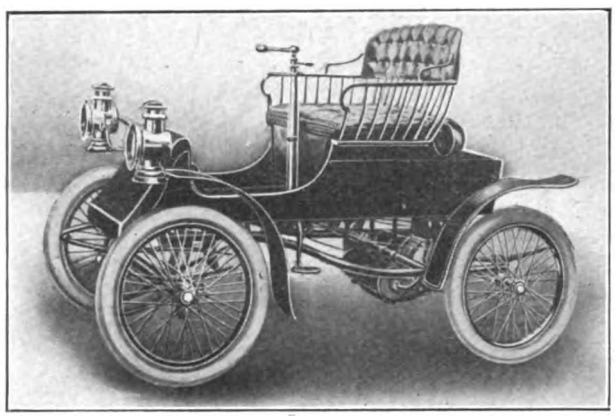
Early Pierce Experiments.

It is difficult to review the history of the gasoline automobile industry in exact chronological order. Sufficient has been developed in this series of discussions to indicate that much of its early development is shrouded in mystery. The pioneer work done by some of the most prominent designers of today did not come to light until after that accomplished by others had begun to bear fruit.

Back in 1897, when Kenneth A. Skinner of Boston was seeking capital for the exploitation of cars fitted with his imported De Dion motor, George N. Pierce of Buffalo became interested in this subject. Too much credit cannot be bestowed upon Skinner for arousing manufacturers concerning the possibilities of the gasoline motor driven road vehicle.

The Original Pierce Motorette.

Pierce had been engaged for some time in the production of bicycles, and it was to such manufacturers that Skinner made his appeal. Unfortunately, the condition of that industry at this time was such as to give those engaged in production considerable anxiety, and Pierce was not ready to embark upon the new proposition until

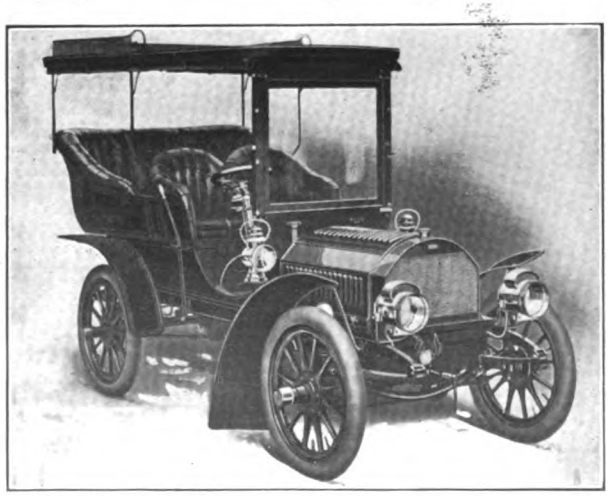


The Ford Six-Cylinder Roadster of 1906, a Pioneer "Little Six."

1901. However, experiments had been under way for some time previous to this date.

The first Pierce car—they were not called

Digitized by Google

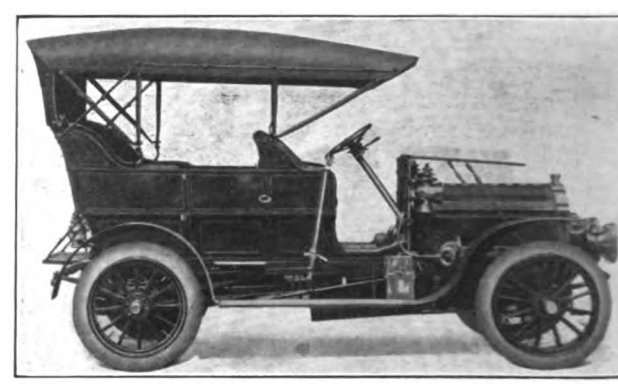


Forerunner of the Present Day Pierce-Arrow—The Pierce Motorette of 1901.

Pierce-Arrow until some years later—was produced in the old bicycle factory. It was a single-cylinder motorette, with motor rated at 2.75 horsepower. One of the original vehicles was entered in the endurance run from New York to Buffalo in September of that year. In its review of the event the Cycle Age of Sept. 26, 1901, had the following to say:

"The wonder of the trip was the Pierce machine. It is a well recognized fact that what the Pierce company does it does well, but no one expected it to take a motor of 2.75 horsepower and build around it a vehicle which could accomplish a feat which overcame vehicles of five times the power and three times the weight."

Although the company was not the first in this country to produce motor cars, it will be conceded that it has occupied an enviable position in the industry from its inception. It has been regarded as a consistent leader in many of the lesser improvements that may be regarded as refinements. It was among the first to utilize the bevel gear for final drive, aluminum castings for bodies, lubrication direct to the motor bearings through a hollow crankshaft, and in the adoption of the six-cylinder power plant.



The First Four-Cylinder Model Produced by the George N. Pierce Company.

Still Giving Service.

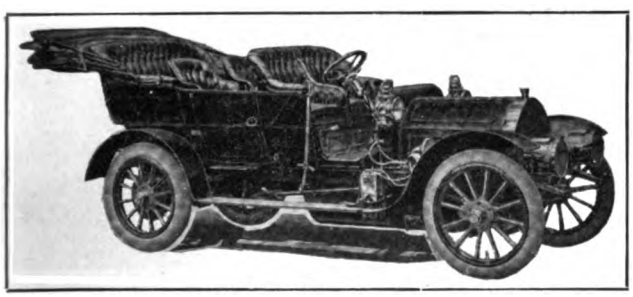
Not long ago the Pierce-Arrow Motor Car Company acted as host at a gathering of past and present Pierce and Pierce-Arrow cars in Buffalo. There was at least one representative of each model produced by the company. The single-cylinder Pierce motorette of 1901 paraded behind the 66 horsepower, six-cylinder Pierce-Arrow suburban of 1912. It was a most imposing sight and one long to be remembered, for some of those old cars were still in use with a mileage considerably in excess of 100,000 to their credit.

Accompanying illustrations show the progress made by this concern. Lack of space forbids the reproduction of all models, but the important steps are delineated down to the introduction of the six-cylinder chassis, and the remainder of the views depict the development along that line to the present.

The Four-Cylinder Pierce Touring Car of 1906.

The wire wheels and tiller steering of the 1901 motorette were continued in the motorette of 1902, but a top was added and the design of the seat was changed to conform more nearly with the practise in vogue today. The two side lamps were retained, and a third, larger lamp was installed directly in front of the vehicle. The driver was placed at the right instead of the left.

In the stanhope of 1903 the motor was increased to eight horsepower, although it still was a single-cylinder unit. Wood wheels replaced the wire members of previous designs and the tiller gave way to steering post and wheel. Seating capacity for four persons made it impossible to retain the front headlight, but the side lamps were continued as before.



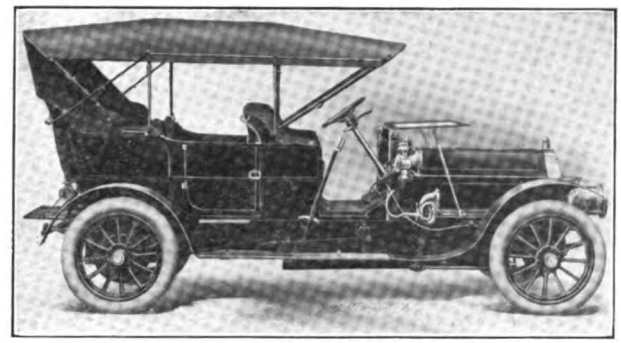
Digitized by Google

The first touring car made its appearance in 1903, and this was fitted with a two-cylinder, 15 horsepower motor, in front under a hood somewhat suggestive of that which has come to be known as the Renault type. The radiator was underneath, directly in front of the front axle. A horn was placed on top of the steering wheel, and the change speed lever was located outside the body at the right of the front seat.

The First Four-Cylinder.

This two-cylinder touring car was continued in 1904 with slight modifications, particularly with reference to the hood and radiator, which were combined in the same manner as that shown in the first four-cylinder model presented herewith. The two-cylinder was not fitted with a top, but in other respects did not differ materially from the four. The latter motor was rated at 24-28 horsepower.

Three models were produced in 1905. The first was really a continuation of the four-cylinder car of the previous year, but with different lines about the doors and a new folding top. The second was styled an opera coach, with entrance from the rear and otherwise resembling the limousine type. The third was known as a suburban car, with side entrance to the rear enclosed compartment. Both of these closed cars were fitted with an engine rated at 28-32 horsepower.



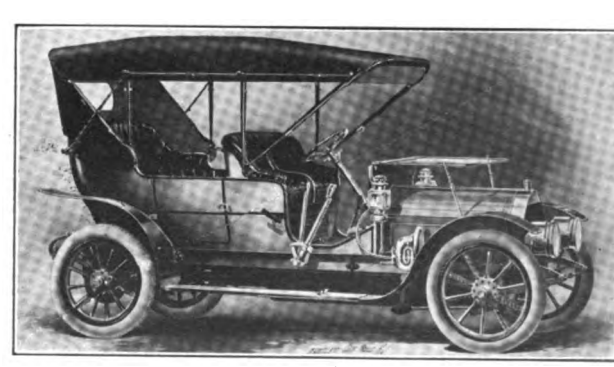
Four-Cylinder Pierce Model of 1907—The First Six Also Appeared in That Year.

An indication of the equipment furnished with the 1906 model is shown herewith. The car depicted had the 28-32 horsepower motor of the previous year. There was another touring model this year, the motor of which was rated at 40-45. The rear was partially enclosed and was fitted with luxurious curtains, which shielded the occupants from the glare of the sun or the gaze of the curious.

The First Six-Cylinder.

The first six-cylinder machine appeared in 1907, but there also were the 40-45 horsepower, four-cylinder touring model shown and a 30 horsepower, four-cylinder suburban. The six was rated at 65 horsepower and provided seating capacity for seven persons. In general appearance it was not unlike the four presented, but its long wheelbase called for slightly differing lines about the doors and elsewhere.

The 60 Horsepower, Six-Cylinder Pierce-Arrow Model of 1908.

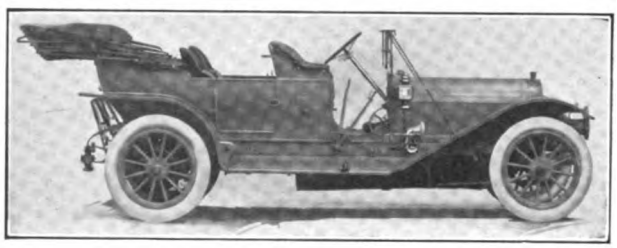


In 1908 there does not appear to have been any four. The six shown was rated at 60 horsepower. A second touring model had a motor of 40 horsepower, and surely this could be considered a "little six."

In 1909 there were two fours and three sixes. Of the former there was a 24 horsepower landaulet and a 40 horsepower suburban. The sixes were all touring models, rated at 36, 48 and 60 horsepower, respectively.

The Modern Pierce-Arrow.

Beginning with 1910 the fours were dropped entirely. The little six of that year was a 36 horsepower runabout with rumble seat, and there also were a touring car of 48, a suburban of 48 and the touring car of 66.



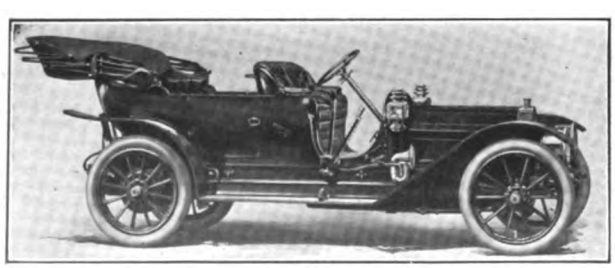
The models of 1911 comprised a 48 horsepower miniature tonneau, 36 touring, 48 touring and 66 touring landau. The last named presented the very latest refinements in the matter of equipment. The running boards formed boxes for carrying tools and other articles that could

The 36 Horsepower, Six-Cylinder Pierce-Arrow Car of 1909.

Digitized by Google

find no place in the large trunk at the rear and two similar trunks on that portion of the top which was not designed to be folded. Spare tires

The 66 Horsepower, Six-Cylinder Pierce-Arrow of 1910.



were fastened to the running board at the right of the driver. The object was to provide every convenience and requirement that could be found necessary or desirable on a long distance tour.

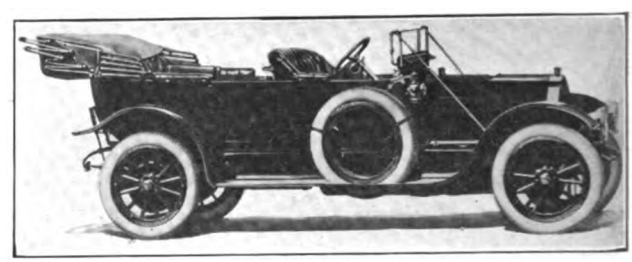
Three chassis models appeared in 1912, these being the 36, to which was fitted a touring body; the 48, with touring and suburban equipment, and the 66, touring car. This concludes the list of machines taking part in the parade to which reference has been made. The line for 1913 is equally complete.

In Conclusion.

Mention might be made herein of the invention of the Knight sliding sleeve motor, the Christie front drive and a large number of other developments, each of which has had its influence upon the industry. Indeed, it would be possible to extend this series indefinitely, since the entire history of the gasoline automobile has by no means yet been written.

The manufacturers will shortly assemble their products in the Madison Square Garden and Grand Central Palace at New York City for the 13th national automobile show. More history will be revealed in that exhibition, and undoubtedly there will be pioneers as well. This series will have served its purpose if it has recalled something of the evolution of an industry which

The 36 Horsepower, Six-Cylinder Touring Model of 1911.



is at most but 21 years old, yet in that short time has taken its place among the principal industries of the country.

AJAX TIRES IN GREAT BRITAIN.

Charles Y. Knight Is Perfectly Satisfied with Showing Made on His Car.

British roads with their surfaces of flint over which automobiles are driven much faster than in America, test automobile tires to the limit of severity. Low tire mileages are the rule and British motorists apparently expect nothing better from their native product. How well an American shoe withstands these conditions is shown by a letter written by Charles Y. Knight, inventor of the Knight motor, to Horace De Lisser of the Ajax-Grieb Rubber Company, New York City.

"I have completed 4300 miles on an Ajax tire, which I received from you last spring," he says. "I must say that taken all in all it is the most remarkable tire I have ever had on a car. Our average speed is at least 10 miles an hour greater on these hard roads, which act like sandpaper,

The 48 Horsepower, Six-Cylinder Pierce-Arrow of 1912.

than is possible on the average American roads. The remarkable thing about the Ajax tire is that during the 4300 miles that it has been running on the rear wheel it has not received from the road a single cut which penetrated to any great depth, apparently the result of the quality of rubber employed in its construction. The result is that the wear stands uniformly even all round and that it is still in good running condition and no doubt might be retreaded to last considerably longer. I am still using it and shall run it to destruction."

The Cutting Motor Car Company, Jackson, Mich., maker of Cutting cars, will soon be ready to announce the launching of a "six," the first car of this type the company has put on the market. Experts on the Cutting staff have been experimenting for several months and have now reached the point where their work is nearly completed. The details of the new model will be awaited with considerable interest.

TELL TALE SPEED INDICATOR.

Los Angeles Police Discover New Invention Utilizing Red, White and Green Lights.

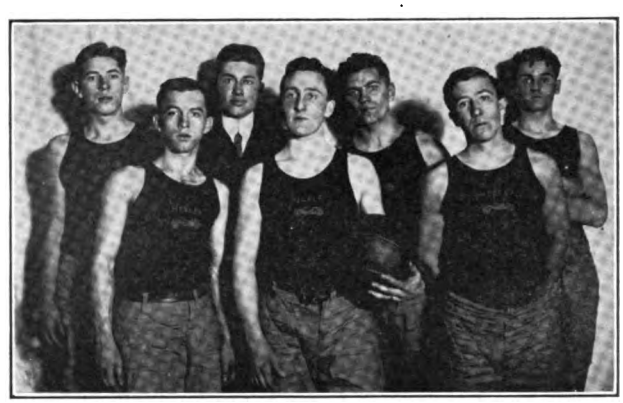
The chief of police of Los Angeles, Cal., has made recommendation to the police commission that an ordinance be passed requiring all automobiles in that city to carry a speed indicator to warn the driver and the public when the required limit is exceeded. The invention, which is said to have been tried out thoroughly by the chief, is an electric lighting device to be placed on the radiator. It comprises three lights, red, white and green, placed one above the other, and the mechanism that switches on the current to the various lamps is connected with a speedometer shaft.

When a car is making 10 miles an hour or less the white light shows; at 20 the green light is thrown on, while at 25 the red lamp is lighted and at speeds in excess of this various combinations are flashed on. Thus an officer can tell at a glance how fast an automobile is travelling, especially at night.

OPENS WASHINGTON HEADQUARTERS.

Good Roads Board of American Automobile Association Locates in National Capital.

With the early opening of headquarters in Washington, D. C., by the American Automobile Association, the campaign of the organized motorists of the United States for national roads takes on new vigor and becomes centred in the national capital. While the principal headquarters of the A. A. A. will remain in New York City, the association's policy of promoting the plan of road building by the federal government has been found to necessitate such close and constant touch with the various federal agencies involved, including the office of public roads of the Department of Agriculture, the engineering corps of the United States Army, the Department of the Interior and others, that it is felt the work can be greatly expedited through the maintenance of a permanent Washington office.



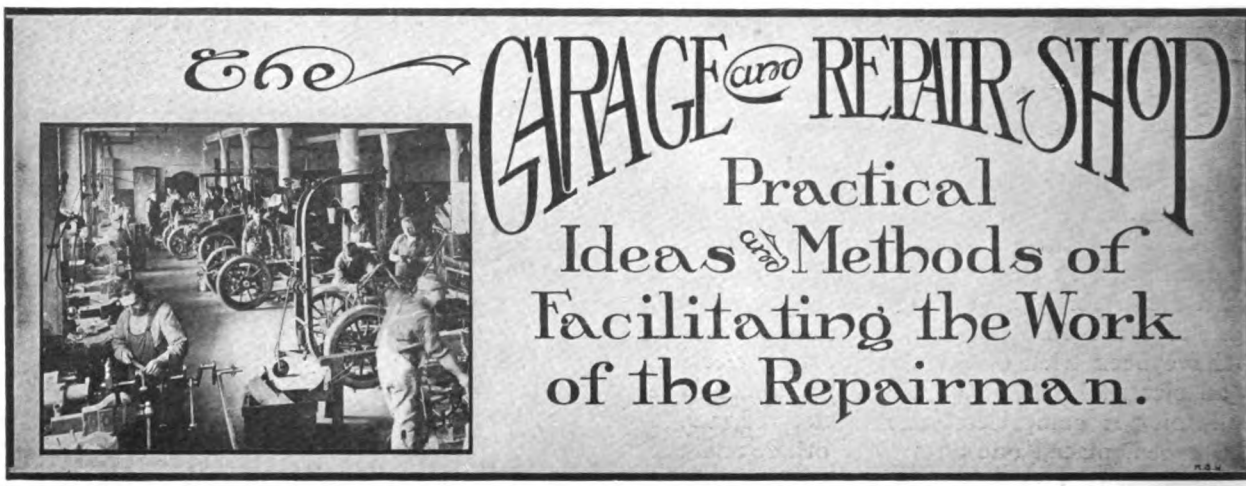
Chairman George C. Diehl of the A. A. A. national good roads board advises that the outlook for the national roads convention to be held at Washington March 6-7, is very promising. Every mail contains notices of the appointment of additional delegates to the meeting and it is already assured that it will be one of the most widely representative and nationally influential good roads gatherings that has yet been held.

MERCER BASKETBALL TEAM.

Like the Cars Made by This Concern It Wins a Majority of the Contests Entered.

Those who followed the performances of the Mercer cars, made by the Mercer Automobile Company, Trenton, N. J., during the 1912 racing season, are not at all surprised to learn that the Mercer basketball team, which belongs to the Trenton Amateur Basketball League, has won a majority of the games played thus far. An accompanying illustration shows the team ready for play.

The members are men recruited from the office and factory force of the Mercer Automobile Company, and almost as much interest has been



Members of the Mercer Basketball Team.

shown by the entire organization of the concern in the outcome of its struggles, as in the contests in which Mercer cars took part during the summer. G. W. Temple of the bookkeeping department is manager.

Sing Woo, a wealthy merchant of Shanghai, China, recently purchased a 48 horsepower Stoddard-Dayton, made by the Dayton Motor Car Company, Dayton, O., and started on a tour of 30 days to the Pacific Coast, after which he will ship the car to the Orient.

As a result of the activities of Robert Lucius, representative of the Panhard-Levassor factory at Paris, France, in Chicago and the Middle West the past few weeks, agencies for the more extensive distribution of Panhard-Knight cars will be established in most of the prominent automobile centres in the territory between Pittsburg, Penn., and the Rocky mountains.

PARSONS OIL LEVEL ALARM.

A device that is interesting, in that the operator of a machine is notified by a whistle when the oil level in the crankcase or sump falls below the predetermined level, is the Parsons oil level alarm brought out by an English motorist. It is suitable for either pleasure or commercial vehicles.

It comprises a small whistle on the dashboard, which is connected by a pipe with the crank-

Parsons Oil Alarm, Sounding a Whistle Automatically When Lubricant Falls Below Proper Level.

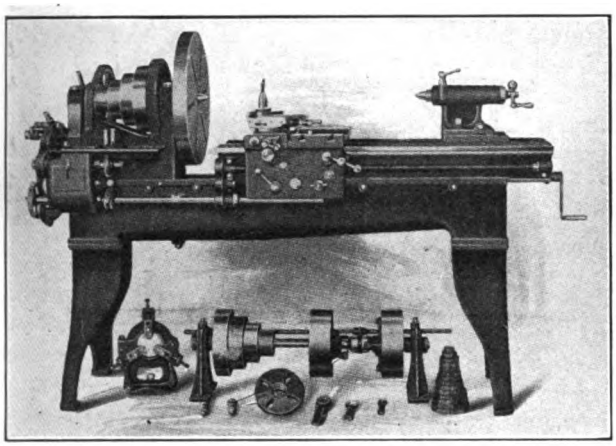
case chamber. The tube passes straight through the crank chamber to a point a little below the proper level of the oil in the sump. While the bottom of the pipe is submerged the whistle is silent, but the moment the lubricant level falls below the end of the pipe the pulsations of air in the crank chamber pass up the tube and actuate the whistle.

As the level of the oil falls it will first be indicated by an occasional note from the whistle on turning a corner or when stopping suddenly, as this momentarily disturbs the level of the lubricant, but as the oil gets lower the whistle blows longer, and finally its note becomes continuous.

The principle of operation is shown in the accompanying illustration and it will be noted that the device is a sump, not a pump indicator, but in conjunction with the ordinary tell tale member which shows the oil is circulating, the whistle provides a safeguard. The alarm member is covered by a neat little hood. It is pointed out that the ordinary breathers of the crankcase are not interfered with, as the whistle is not blown by pressure, but by pulsation.

The device would prove of value on both pleasure and commercial vehicles, and the material should not be found costly or the installation difficult.

HARDENING CAST IRON.



Many times it is convenient to make an article of cast iron that needs to be finished, and which should be very hard. Cast iron can be hardened as easily as steel, and to such a degree that a file will not touch it. Take one-half pint of vitriol, one peck of common salt, one-half pound of saltpetre, two pounds of alum, one-quarter pound prussic potash, one-quarter pound of cyanide of potash, all to be dissolved in 10 gallons of soft water. Heat the iron to a cherry red and dip it into the solution. If the article needs to be very hard, heat and dip the second or even the third time.

NEW MACHINERY AND TOOL EQUIPMENT.

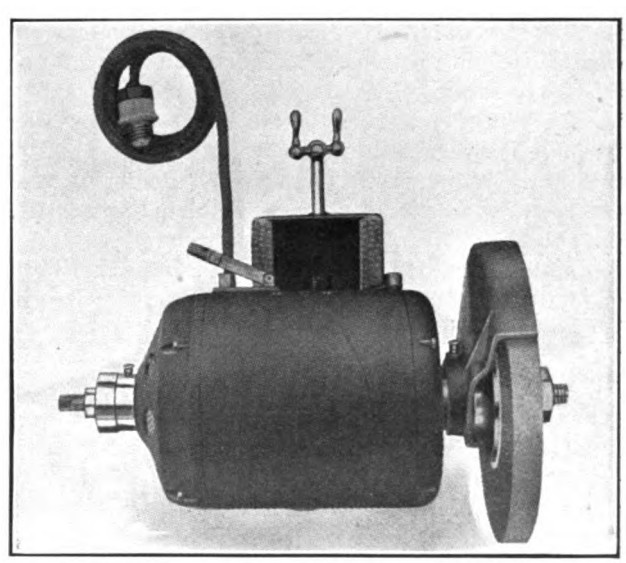
BARNES LATHE.

There is a growing tendency to utilize electricity for power in the repair shop, as this form

Barnes 14 to 24-Inch Sliding Extension Gap Lathe, Constructed with Self-Contained Motor Drive for Utilizing Electricity.

of energy is very convenient where there is no line shaft and where current is available. The Barnes Drill Company, Rockford, Ill., is manufacturing a 14 to 24-inch sliding extension gap lathe which is especially adapted for automobile and general repair work, and one of its features is a self-contained motor drive.

The lathe is sturdily constructed, will handle a wide range of work and is provided with six quick change geared feeds. The spindle is of ample size, being 2.9375 inches in the front bearings and has a 1.5625-inch hole in it. The sliding bed top is valuable for general repair work in that it allows the swinging of pieces of larger diameter through the gap and of greater length between centres than with an ordinary lathe. The maker also points out that it has strength and power to turn the full diameter of swing in the gap, and at the same time it is free from awkward features when the gap is closed.



The bed is well designed and the top and main beds are planed full length. They are fitted together by a dove tail construction, permitting the top bed to be held firmly at any point by means of clamp bolts, and to be drawn back by a screw and crank device. The rack and pinions are cut from steel, the former being in one piece.

The cone pulley has four steps of ample diameter, is strongly back geared and provides eight changes of speed. A push pin on the head gear allows the cone to be locked or unlocked without the use of a wrench. The tail stock is of the offset type, allowing the compound rest to set parallel with the bed, and has set-over adjustment for taper work. The compound rest has a graduated base and has sufficient travel for the largest capacity of the lathe.

THE HISEY PARALLEL GRINDER.

The Hisey-Wolf Machine Company, Cincinnati, O., is marketing a portable parallel grinder actuated by a direct current and particularly designed for grinding rolls, journals, bushings, crankshafts, connecting rods and hardened work of all kinds. As will be noted by the illustration, the grinder has an angle plate which is bolted in the tool post left of the lathe, and a vertical adjustment of four inches to bring it in line with the centres. The tool can also be used to a great advantage in a planer for surface grinding.

The grinder is made in five types, the dimensions of the smallest being 5.75 by 10 inches, that of the largest 11.5 by 23.5. The horsepower of the lightest member is .5, while that of the heavier machine is three. The size of the grind-

The Hisey Parallel Grinder Operated by Electricity.

ing wheel varies from eight by .75 inch to 14 by two inches. The motor is designed to be operated by either a 110 or 220-volt direct current, is wholly enclosed and guaranteed dust proof.

GARAGE AND SERVICE STATION EQUIPMENT.

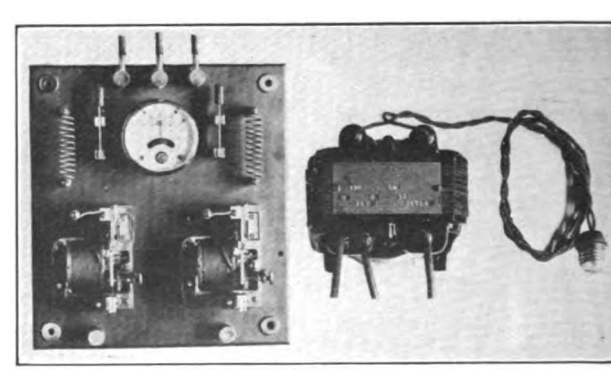
ALLEN FRICTION WRENCH.

Any device or tool that saves time in the repair shop makes for economy and increases business, in that the customer receives the benefit of the labor saving appliance. The workman in the overhaul of the chassis frequently loses considerable time searching for some special combination of tools for removing a bolt or nut not accessible with ordinary members. Sometimes the nut is so located that there is room to swing a wrench but a slight distance and not enough to turn the nut so that the wrench may secure a proper grip on the next movement.

Allen Friction Wrench Set.

A tool that presents interesting features, because there is no lost motion and with which an instantaneous grip may be secured, is the Allen friction socket wrench, made by the Allen Wrench & Tool Company, 4 Meadow street, Providence, R. I. It is not a ratchet device and its grip is secured through a patented application of the friction principle. It is particularly adapted for removing and replacing nuts or bolts where there is a very small space and as the wrench grips instantaneously it follows that a minimum movement is possible. Being practically one solid piece when assembled there is no play to the working parts. It is reversible.

The maker lays great emphasis upon the high grade material and workmanship and the wrench is a drop forging of high point carbon steel, carefully machined, pack hardened and finished. All moving parts of the friction member are ground accurately and the limit is exceedingly fine. Three sizes are manufactured, the No. 31 set being shown. This comprises, in addition to the wrench, 31 steel sockets varying in size by 30 seconds from .3125 to 1.28125 inches. These are of a high grade steel and each is heat treated and case hardened. Two extensions are provided, a short and long member, the latter being 9.5 inches, also a universal joint. This is constructed in a substantial manner and is designed for severe service.



There are also three square sockets, these being .40625, .53125, .65625 inch, respectively. The screw driver is unusually well designed as is the spark plug socket. The outfit comes in a neat, substantial box and is moderately priced. In addition the company makes different sized outfits to meet individual requirements and the No. 10 wrench may be purchased separately. When utilized with the spark plug socket it facilitates the removal of plugs not reached easily with the ordinary tool. A drill attachment also is being manufactured.

WAGNER CURRENT RECTIFIER.

It is a well known fact that direct current must be employed to charge storage batteries. In many places the lighting or power circuit is alternating, which consists of a very rapid series of current impulses, flowing first in one direction, then in the other. Such a current is not suitable for charging storage batteries, because the amount of charge put in the battery by the current flowing in one direction is immediately neutralized by a corresponding amount of current, immediately following, flowing in the opposite direction.

There are many small garages which could handle the work of charging ignition and lighting batteries if provided with a rectifier for converting the alternating current and there is considerable profit to be derived, to say nothing of the convenience to the customer and proprietor.

The Wagner Electric Manufacturing Company, St. Louis, Mo., markets a number of different types of rectifiers to meet individual requirements and in the accompanying illustration is shown one of these devices adapted to 110-volt circuits and for charging three-cell, six-volt bat-

Wagner Alternating Current Rectifier for Charging Storage Batteries.

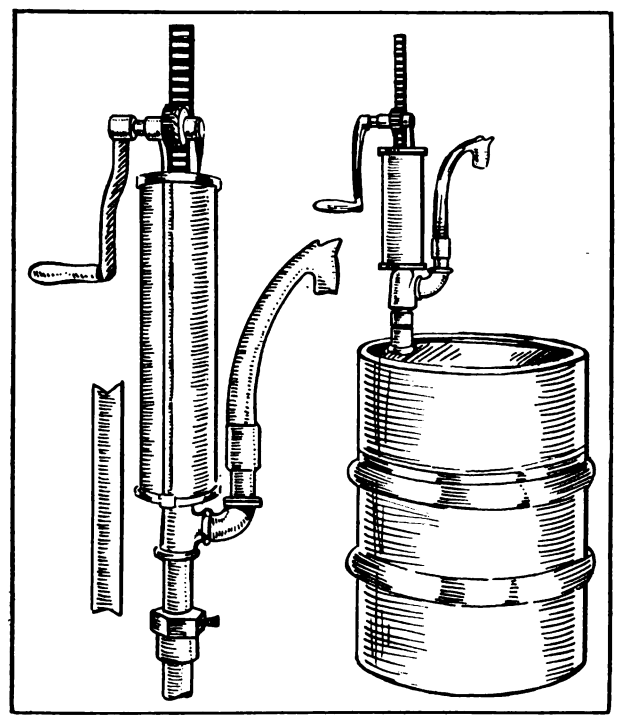
Digitized by Google

teries. A two-coil transformer reduces the voltage or pressure of the alternating current to a low voltage suitable, after rectification, for charging the battery. The device also includes the rectifier proper and a resistance member for limiting the charging current. An indicating ammeter is included in the outfit for the purpose of showing the rate, and a lamp cord and socket provide means for connecting to the main line.

MILWAUKEE BARREL PUMP.

The average garage handling lubricating oils buys in barrels lots and the general practise is to dump the contents of the barrels into large reservoirs. Sometimes the garage is handicapped for room and handles but one barrel each of light, medium and heavy oil of one make. If the lubricant is not placed in a special container the work of filling cans causes more or less loss through the oil spilling or dripping.

The Milwaukee Tank Works, Milwaukee, Wis., is manufacturing a pump especially designed for service where it is not convenient or practical to utilize tanks. It is made in two types, 10 and 11, as shown in the accompanying illustration, and the former design is for screwing firmly into the threaded opening of any steel barrel. The number 11 pump is provided with a light, strong stand, making it suitable for use with wooden barrels and for pumping directly out of the bung hole, while the barrel is laid on one side.



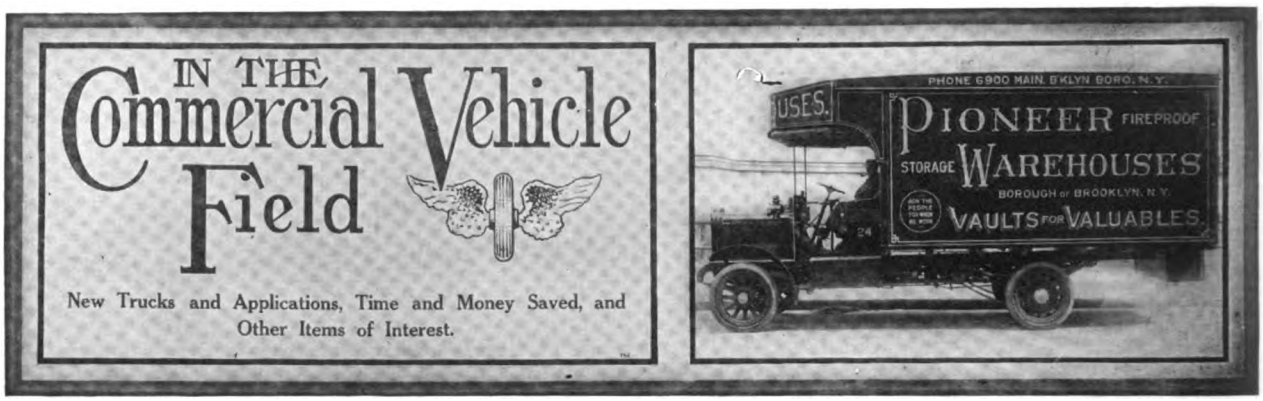
It is pointed out that the barrels may be in a row and close together. The stand does not occupy any additional room, merely straddles the barrel, preventing rolling while the pump is being mounted for service. The pumps are adjustable to measure a pint or quart at a stroke as desired, and it is held that the entire contents of a barrel can be pumped out, eliminating spilling or dripping and making for economy. When evaporable fluids are to be employed, a special faucet is provided, this being listed slightly extra.

EASTERN RUNABOUT OUTFIT.

The Eastern Oil Tank Company, Lowell, Mass., is marketing a runabout outfit for service in garages and for filling car tanks with fuel from the sidewalk. The tank is cylindrical in shape, sturdily constructed and the wheels upon which it rolls are located underneath. They are of the swivel type, ball bearing and are fitted with rubber tires.

The tank is equipped with a pump having a dial indicating the amount of fluid discharged, and one turn of the crank registers one-half gallon. The equipment includes nine feet of one-inch flexible hose which is provided with a shut-off cock. The capacity of the tank is 60 gallons. Complete specifications will be forwarded upon request.

When the whistles on the factories of the Goodyear Tire & Rubber Company, Akron, O., maker of Goodyear tires, blew shrilly one day recently, the residents of the city thought a huge fire was in progress, but on investigation found



Milwaukee Barrel Pump, Permitting the Drawing of Oil in Quantities to Meet Requirements.

that the tire making records of the shops had again been exceeded. On this day the number of tires produced was far in excess of that on any other, being 5200. With the completion of the three new buildings it is anticipated that the daily output of the Goodyear factory will be 8000 tires a day.

The Pittsburg Gage & Supply Company, Pittsburg, Penn., builder of the new Duquesne car, completed the first finished machine Nov. 30. It is a four-cylinder, five-passenger touring car and the first six-cylinder model will appear about the first of the year.

WANTS ADDITIONAL WHITES.

Russia Informs Cleveland Company That It Needs Ten More American Trucks at Once.

War and rumors of war in Europe have brought business to the White Company, Cleveland, O., maker of the White line. Russia, preparing for what might happen as a result of the Balkan trouble, has made the motor truck a big factor in army equipment. Word was received at the factory recently that the Russian government wanted 10 three-ton White vehicles for immediate delivery. It goes without saying that the order will be filled promptly.

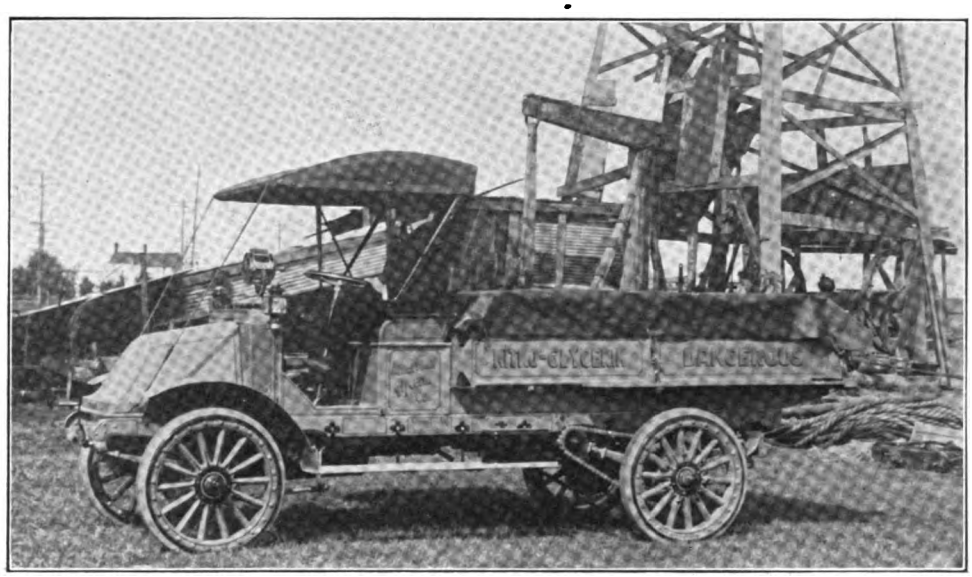
This is held to be a sequel to the peaceful victory of the White last summer in a war department truck competition held in the Czar's dominion, in which nearly every important maker of power wagons in Europe was a contestant against the White company's product. Of the five White machines which started all finished the 1800-mile test with no repairs or adjustments and examination of the working parts developing no wear of any kind. As a result of this the five trucks were promptly bought as they stood, that being the only purchase made as a result of the test. The recent order, however, is a warm testimonial of the regard with which the White machines are held by the Russians.

White 1.5-Ton Truck Which Carried the Fuel in the Recent Russian Army Trials.

MACK BURNS DISTILLATE.

Specially Built Lumber Vehicle in California Designed to Operate on Heavy Fuel.

One of the largest trucks used in lumber hauling in Los Angeles, Cal., is a five-ton Mack, made by International Motors Company at Allentown, Penn., recently put in service by the Kerckhoff-Cuzner Lumber Company. The truck was built especially to the order of the lumber concern and the length of the bed at the rear of the driver's seat measures 18 feet, two inches. Twenty-six foot lumber is carried with ease.



The truck has been equipped with the Barnard carburetor and burns distillate. A novel loading device has been perfected by the company at the lumber yards at Alameda and Macy streets. When a load of lumber is assembled it is hauled by wagons to a specially built crane which, when the load is complete, picks it up and places it on the waiting truck. The latter is idle only an average of five minutes while being loaded, which greatly increases the amount of work possible to complete with it in a day and makes for efficiency.

HANDLING NITROGLYCERIN WITH ADAMS TRUCK.

Extreme care must be taken in the handling of nitroglycerin, and that it is possible to convey this explosive in motor trucks is looked upon with interest among those who are not familiar with the subject. Cars have been used for this purpose for some time and in many localities, but perhaps the largest installation of such vehicles is to be found in the oil well regions. An accompanying illustration shows one of the Adams trucks, made by the Adams Bros. Company, Findlay, O., in service with the American Glycerin Company.

Nitroglycerin is marketed in two forms, one being that known as dynamite, in which the nitroglycerin is combined with some porous substance and is formed into sticks, and the other being in the liquid state. In the latter instance it usually is sold in cans resembling those used for maple syrup. These cans usually are packed in sawdust to absorb shock.

Adams Truck Utilized by American Glycerin Company for Handling High Explosives.

The explosive will burn in an open vessel without explosion, but when heated in a closed can it will explode readily. Usually, however, it is exploded by detonation, the most common method today being by electric battery, although the fuse is still utilized to some extent. Special permits must be obtained before it is possible to carry nitroglycerin through the public streets or on railways, because of the danger from shock.

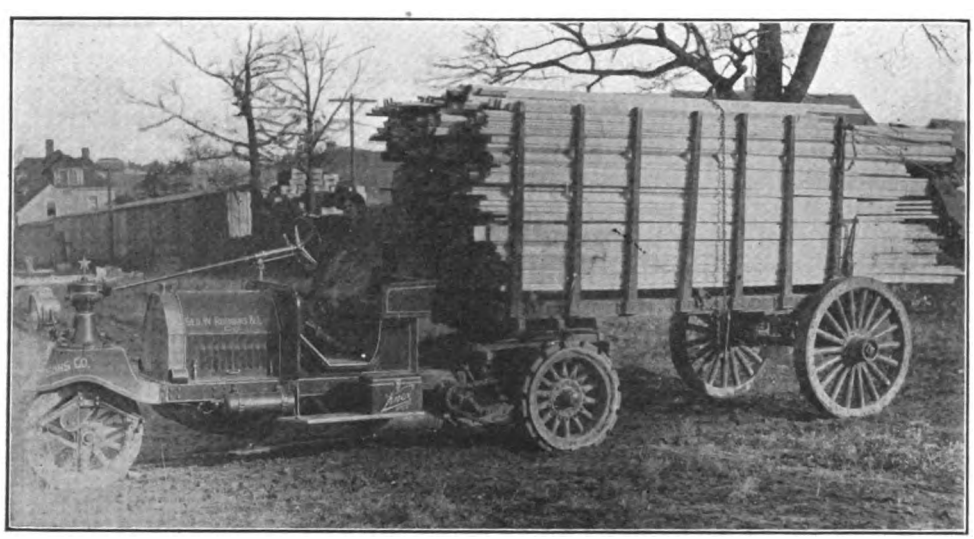
It follows that the body work on trucks used for this purpose must be specially designed, this involving the use of shock absorbing springs, etc. In the Adams truck under discussion, this plan is followed, but aside from the special body construction, as may be noted by the illustration, the balance of the car is the regulation Adams stock chassis.

The trucks utilized by the American Glycerin Company have a carrying capacity of 720 quarts of the explosive, in addition to the shells used for lowering this into the wells. From records kept by the company the operation of these vehicles has shown an efficiency of two-thirds more work accomplished in a given time than formerly was possible with horses.

PEERLESS IN PORTO RICO.

Passenger-Carrying Vehicles Replacing Trolley Installations Even in Remote Districts.

That the stage coach will never appear again even in places remote from trolley car lines is shown by the constantly increasing number of motor trucks that are fitted with passenger-carrying bodies. A line of such vehicles was recently established in San Juan, Porto Rico. A number of Peerless machines, made by the Peerless Motor Car Company, Cleveland, O., with special passenger bodies, will operate, each carrying 40 persons and baggage.



The first truck put into this service operated between Catano and Bayom, towns in the fruit growing district of the island, which are about 7.5 kilometers, or 4.5 miles apart. One round trip was made every hour from 7 in the morning to 10 in the evening, so that the truck covered a total distance of 144 miles each day for seven days a week. After the Peerless had been in use for a time others were purchased.

SOLVING THE LUMBER DEALERS' PROBLEMS.

That it is possible to operate motor vehicles in lumber haulage with economy has been demonstrated in numerous instances, but the question of efficiency enters into the subject to a somewhat greater extent than in many other lines. The mechanical transport can move larger loads with greater ease and in less time than horses, but the problem lies in the possibility of reducing the time necessary for loading and unloading, in order that the truck may be utilized to its maximum in carrying useful loads.

An accompanying illustration presents the Knox Martin tractor, made by the Knox Automobile Company, Springfield, Mass., and placed in service with the George W. Robbins Company of that city. This equipment is employed in operation on the long haul work, making trips to Northampton, Palmer and Westfield, and covering distances varying from 10 to 20 miles with excellent results.

Knox Motor Tractor in Lumber Service with George W. Robbins Company, Springfield, Mass.

This concern has been using a Knox two-ton truck for the past two years, and for this reason its experience with both horses and motors has been such as to indicate that its opinion with reference to the tractor is of decided value. The economy represented by the truck over horses was clearly demonstrated, but the Robbins company was convinced that the time lost in loading and unloading was a serious handicap, which the tractor entirely overcomes.

It will be noted, from examination of the illustration, that the lumber is loaded upon the old horse wagon body. The construction of the tractor is such that the front wheels and reach of the wagon are replaced by regulation motor truck road members. The tractor merely takes the place of the horses.

The lumber is loaded in the yard, while the tractor is making delivery of the previous load. The front of the wagon is rested upon wooden horses, or some other similar arrangement is applied, and when the tractor returns it is a simple matter to connect with the loaded vehicle, no time being lost in the operation. The lumber is unloaded at its destination by a system of rollers, as indicated.

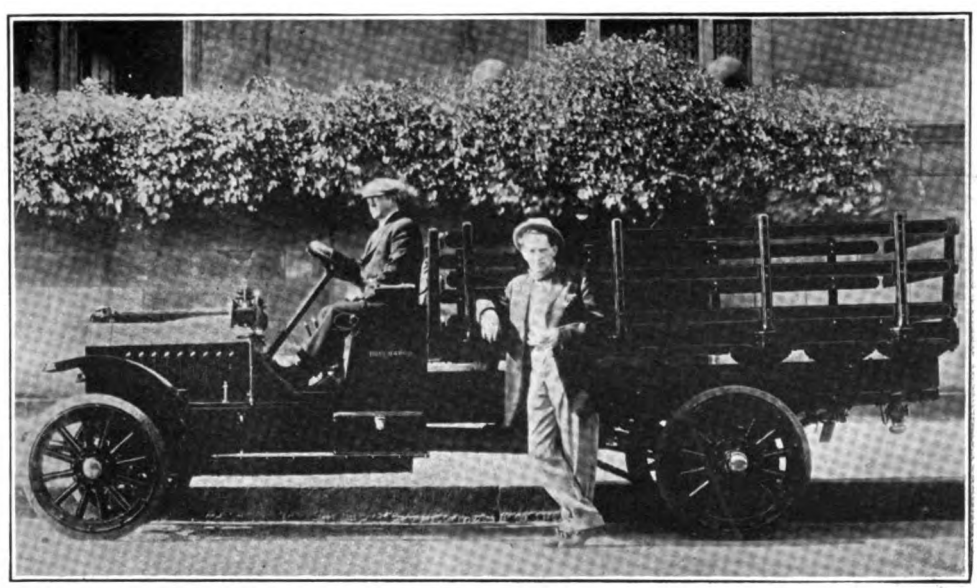
That the lumber trade is interested in this subject is borne out by the fact that since the advent of the Martin tractor the Knox company has received an ever increasing number of inquiries concerning its features. The ease with which the different bodies may be interchanged makes it possible to keep the equipment constantly at work with a high earning capacity, and this seems to be just what the lumber dealers want. The Knox company also contends that the use of a three-wheeled tractor reduces tire expense in a material degree.

EFFICIENCY WITH TRAILERS.

Lowell Transportation Company Utilizing Garford Machines with Splendid Results.

The Automobile Transportation Company of Lowell, Mass., which does a big trucking business within a radius of 100 miles of that city, started its experiment with motor vehicles with three five-ton Garford trucks, made by the Garford Company, Elyria, O. The company has just ordered five more of the same type from the R. & L. Company, Boston, distributor for the Garford machines.

Digitized by Google



Trailers will be attached to these vehicles and on reaching Cambridge en route to Boston, they will be left to be unloaded and then reloaded, while the trucks will continue to Boston. On the return trip the trailers will be picked up and taken back over the road, so that seven or eight tons will be handled by each machine.

BOSTON MAN BUYS KISSELKAR.

E. B. Dane Selects Two-Ton Model for Use on His Estate Just Outside the Hub.

An accompanying illustration presents the new two-ton KisselKar truck recently delivered to Ernest B. Dane of Boston, Mass., for use on his estate just outside the city. It is a particularly attractive vehicle from the works of the Kissel Motor Car Company, Hartford, Wis., and was selected by Mr. Dane after careful investigation of the truck situation in Boston and vicinity.

This car is one of a type which has given exceptionally satisfactory service in all lines of work in various sections of the country. Like all KisselKar trucks it is designed to have reserve strength and power. The axles are tested for four tons capacity, and the motor is rated at 40 horsepower. A fourth geared-up speed is held to permit full speed on empty trips, thereby allowing for a saving in time, particularly where hauls are comparatively short, and where the loading facilities are good it is anticipated that the vehicle will do almost as much work in a day as trucks of larger capacity.

Two-Ton KisselKar Truck Recently Placed in Service by E. B. Dane of Boston.

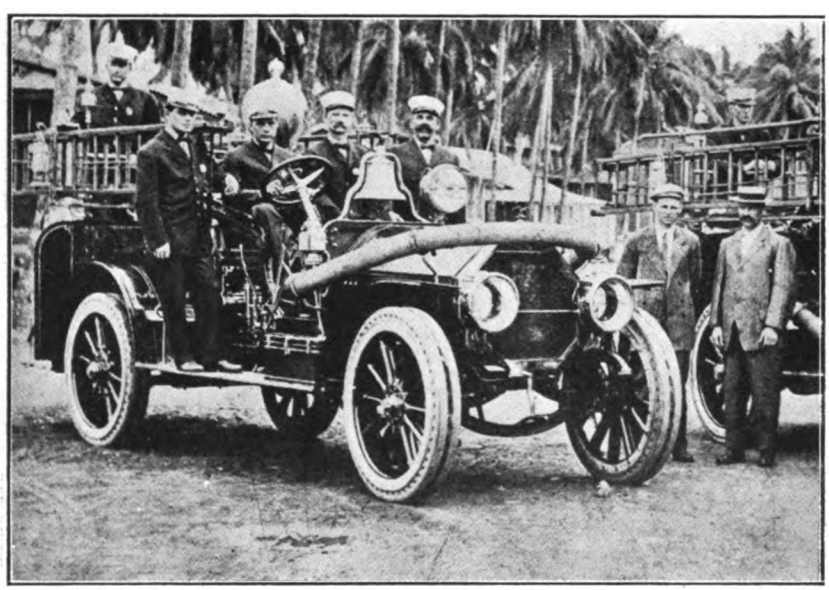
The First National Bank of Boston has purchased its second White truck, made by the White Company, Cleveland, O. This machine, which is rated at 1500 pounds, is electrically lighted and all its locks are operated from the driver's seat so that entrance is impossible without the consent of the man at the wheel.

MOTORS VS. MULE TEAM.

Five-Ton Truck Takes Ten Minutes to do Seven Hours' Work Done by Eight Mules.

Recently a test was made in the famous Fish Creek section, between Phoenix and Roosevelt dam, in Arizona, to learn the relative efficiency of the mule team and the motor truck. From the bottom to the top of the hill is 1.75 miles and the average grade is 10 per cent. It took an eight-mule team seven hours to haul a five-ton load up the grade. A motor truck took the same load up in 10 minutes.

Over the same road a Federal truck, made by the Federal Motor Truck Company, Detroit, fitted with a 20-passenger 'bus body, has been making daily runs for eight months between Phoenix and Roosevelt. Not once has this truck caused its owner the least bit of trouble. He is much pleased with his motor stage and contemplates the purchase of another Federal, as his business is increasing rapidly. It may be added that this has been the experience of others who have adopted Federals for this work.



P. J. McMahon & Sons, an old established funeral director of New Orleans, La., recently conducted the first automobile funeral ever held in that city. Besides the magnificently constructly hearse, which moved noiselessly at subdued speed, the cortege was made up of limousines and taxicabs.

GOODYEAR TIRES IN FIRE WORK.

Well Known Maker Produces Special Type as the Result of Experimentation.

As the result of investigations conducted by F. H. Sawyer of the fire truck department of the Goodyear Tire & Rubber Company, Akron, O., the experimental department of that concern has developed what is known as the Goodyear cushion fire truck tire. Briefly described, this product possesses a dual tread, thereby providing a pliable construction that is readily distorted. The sides are so molded as to produce numerous pockets, which are separated by inclined partitions or bridges, the latter acting as hinges and permitting a natural displacement of the rubber. The pockets also are held to provide the necessary space for the hinged action of the bridges and for the displacement of the rubber.

Webb Combination Pumping Engine and Hose Wagons in Service in Panama and Fitted with Goodyear Cushion Fire Truck Tires.

An accompanying illustration shows a Webb combination pumping engine and hose wagon in service with the United States government in Panama. This is equipped with the new Goodyear tires and the reports indicate that they have given splendid satisfaction under the peculiar conditions which exist on the isthmus.

A severe government test recently was made at San Francisco, Cal., of a two-ton Piggins truck, made by the Piggins Motor Car Company, Racine, Wis. The climax was reached when the vehicle climbed both the California and Jones street hills without faltering in the least. Jones street has a grade of more than 28 per cent. and usually is avoided by automobiles, both on this account and because of its grassy condition through lack of use.

GRAMM ECONOMY IS MARKED.

California Transportation Concern Finds It Operates at Half the Cost of Horses.

A. T. Neely, manager of the Colyear Motor Sales Company of Los Angeles, Cal., has received word that one of the big Gramm trucks, made by the Gramm Motor Truck Company, Lima, O., which was sold to a transportation company at Lake Tahoe, Cal., is performing excellent service and earning dividends for its owner. The truck covers 50 miles each day between the railroad and Lake Tahoe and to the various camps and resorts around the lake.

All the grades around Lake Tahoe are extremely heavy, some of them being as high as 22 per cent., but the truck goes over them without the least difficulty. During the past three months the machine has been hauling fruit and general merchandise. According to a carefully prepared analysis the truck has cut the cost of transportation to about one-half that of doing the same work by horses. During the winter the car is being used to haul material for road making and other general construction carried on by the company.

Twenty one-ton trucks have just been delivered by the Baker Motor Vehicle Company, Cleveland, O., maker of Baker electrics, to the St. Paul Bread Company, St. Paul, Minn. This installation is one of the largest electric fleets in bakery service.

N. D. Phelps, president of the N. D. Phelps Company, Barre, Vt., is enthusiastic over the fact that his 1500-pound KisselKar recently covered 18 miles an hour, running from Barre to White River Junction, Vt. On the return trip 14 miles an hour were made in a driving rainstorm. The amount of gasoline consumed was 8.5 gallons.

CORRESPONDENCE WITH THE READER

Wiring Lights and Master Vibrator.

(1465)—Being a subscriber of your magazine I am taking advantage of your offer to supply information. I am contemplating fitting a master vibrator to my Ford car and wish to use dry cells for starting during the cold weather, also to fit electric headlights as I am afraid the water in the generator will freeze and I do not care to go to the expense of a gas tank. Will you kindly forward me wiring plan for cells, lamps and vibrator?

SUBSCRIBER.

Newburyport, Mass., Dec. 11.

The wiring of the components may be accomplished by following the diagram presented at Fig. 1. It will be noted that neither the secondary wires or cables leading to the spark plugs, nor the leads to the timer, are disturbed. The first step after installing the master vibrator is to short circuit or shunt the regular coil. This is done either by screwing down hard the adjusting screw of the vibrators or utilizing a piece of copper wire as shown in the drawing.

One wire is then led from the battery terminal on the large coil to the centre terminal on the vibrator. The right hand binding post is fitted with a lead which is secured to the magneto terminal. One pole of the dry cells is grounded while the other is secured to the left hand terminal of the vibrator. By throwing the switch lever to the right, current will be taken from the magneto, while the left position will bring the batteries into service.

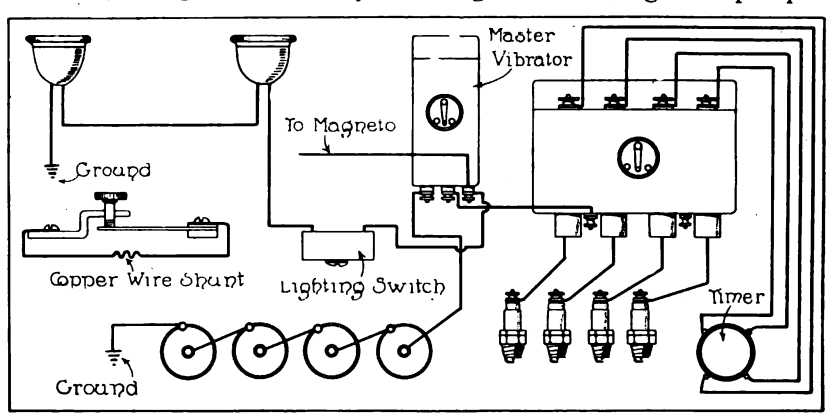

Fig. 1—Wiring Plan for Master Vibrator, Dry Cells and Electric Headlights, Current to Which Is Supplied by the Magneto-Generator.

In installing the lamps, one side of their circuit is grounded as shown in the drawing. The other wire is led to a lighting switch, and a connection is made between it and the right hand terminal of the vibrator. The lighting switch permits of cutting in or out the headlights as desired when the motor is operating.

Proper Lead of Magneto.

(1466)—I am about to install a Bosch magneto having a variable breaker box and would like instructions as to how to set it to obtain the best results. What is the best method?

A. J. F.

San Francisco, Cal., Dec. 13.

In the first place it is important that the instrument be driven by gears or a shaft with coupling. While the chain may be employed, provided it is free from slack, the writer holds that unless the driving member be enclosed and operate in a bath of lubricant, good results will not be secured. Another factor to be considered is the stress of a chain upon the armature bearings.

As a general rule the magneto is installed so that the contact points of the breaker box open at a certain point, corresponding to a predetermined angularity of the crank throw from vertical, the relation of the piston travel to the rotation of the crankshaft depending upon the stroke and the length of the connecting rod. The latter factor may be eliminated except in the case of extreme variations.

It is a simple matter to learn the piston travel in inches by inserting a wire through an open pet-cock. It is not so easy, however, to determine accurately the rotation of the crankshaft, and to obviate the necessity of lengthy computations the diagram presented at Fig. 2 was compiled by the Bosch Magneto Company of New York City. With this it is a simple matter to ascertain the angularity of the crank throw from vertical, provided the stroke and piston travel in inches are known.

In the diagram the relation between the piston travel and the connecting rod length is 1:4.5. The vertical lines numbered at the bottom give the stroke of the motor in inches, the rotation of the crankshaft in degrees being indicated by the slanting lines and the figures at the right. The figures on the left and the horizontal lines indicate the piston travel in inches. To illustrate the

Digitized by Google

use of the diagram, let it be assumed that it is desired to find the piston travel for an advance of 30 degrees on a motor having a six-inch stroke:

The vertical line for the desired stroke may be identified by the figures at the bottom of the diagram, and this vertical line is followed upward until it cuts the diagonal line indicating the desired number of degrees, which is 30 in the present case. The horizontal line nearest this point is followed to the left, and in the illustration it will be noted that it indicates about .5 inch. This figure denotes the advance in inches corresponding to a rotation of 30 degrees of the crankshaft.

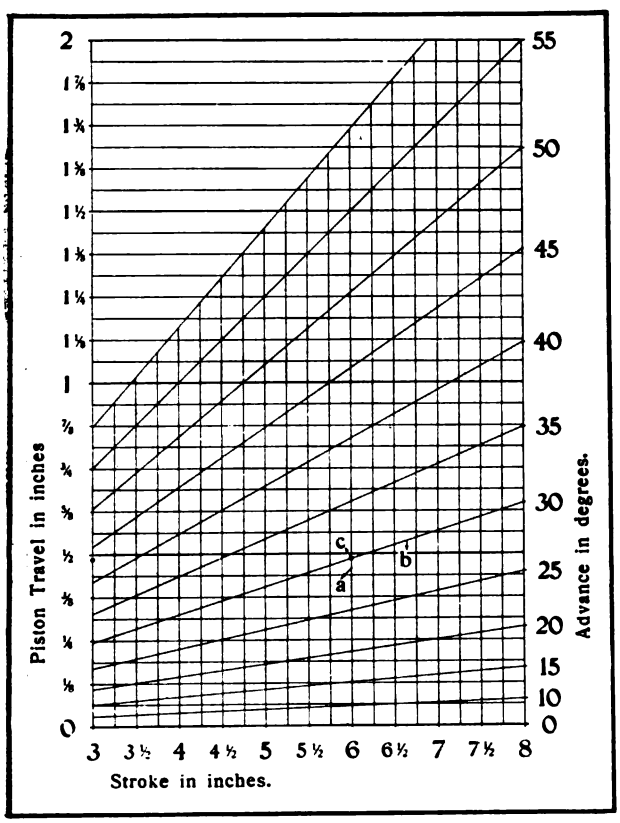

Fig. 2—Bosch Timing Diagram for Ascertaining the Angularity of the Crank Throw from Vertical When the Stroke and Piston Travel Are Known.

Consequently, in setting a magneto on an engine having a stroke of six inches, it only will be necessary to insert a wire in the opening of the petcock of the proper cylinder to be timed, and turn the flywheel backwards past dead centre until the piston has descended about .5 inch. This will correspond approximately to a rotation of 30 degrees of the crankshaft.

The type of magneto was not mentioned, but complete information as to installation, care and maintenance will be forwarded upon application to the Bosch Magneto Company, 225 West 46th street, New York City.

Specific Gravity.

(1467)—I note reference made to specific gravity. What is it and how is it figured out? CURIOUS.
Newark, N. J., Dec. 14.

The specific gravity of a substance is its weight as compared with that of an equal bulk of pure water. To ascertain the specific gravity of a substance, W = weight of body in air; w = weight of body submerged in water.

$$\text{Specific gravity} = \frac{W}{W - w}$$

If the substance be lighter than the water, sink it by means of a heavy substance, and deduct the weight from the heavier material.

Specific gravity determinations are usually referred to the standard of the weight of water at 62 degrees Fahrenheit, 62.355 pounds a cubic foot. Some experimenters have used 60 degrees Fahrenheit as the standard, and others 32 and 39.1 degrees. There is no general agreement.

Given specific gravity referred to water at 62 degrees Fahrenheit, to find weight a cubic foot, multiply by 62.355. Given weight a cubic foot, to ascertain specific gravity, multiply by .016037. With specific gravity known and weight a cubic inch desired, multiply by .036085.

Specific gravity is utilized in chemistry, and when the density of liquids, such as gasoline for example, is desired, an instrument known as a hydrometer is employed. It is usually made of glass and consists of three parts, an upper stem or fine tube of uniform diameter; a bulb or enlargement of the tube, containing air; and a small bulb at the bottom, containing shot or mercury. The last is for the purpose of making the instrument float in the liquid in a vertical position. The stem is graduated and the figures may represent either specific gravities, or the number of an arbitrary scale, as in Baume's, Twaddle's, Beck's or other hydrometers. There is a general tendency to discard all hydrometers with arbitrary scales and to utilize only those which read in terms of specific gravity alone.

Autogeneous Welding.

(1468)—What is autogeneous welding and how does it differ from welding as done by the blacksmith?
INTERESTED.
Peoria, Ill., Dec. 20.

Antogeneous welding, so-called, is accomplished with acetylene gas and oxygen stored in tanks under pressure. The two gases are combined and burned in a special torch or burner. An

Digitized by Google

intense heat is produced; said to be in the neighborhood of 6000 degrees Fahrenheit. It is utilized to weld or fuse iron, steel, aluminum, brass, copper or other metals. The process is also called oxy-acetylene. It differs from the process employed by the blacksmith in that no flux is used. The oxy-acetylene torch is also employed for cutting metals, such as steel plates, beams and large forgings; for repairing flaws or defects, or for filling cavities by melting a strip of metal and flowing it into place.

Heat Treatment of Steels.

(1469)—Quite frequently I note that a certain part of a car described in your book speaks of a shaft for instance being carefully heat treated, etc. What is the process and why is it done? Does it make for a better material or is it to eliminate wear? OWNER.
Washington, D. C., Dec. 17.

In working the high-grade alloy steels it is very important that they be properly heat treated, as poor workmanship in this regard will produce working parts that are no better than ordinary steel, although the stock utilized be of the highest grade procurable. By improperly heat treating them it is possible to make high-grade steels more brittle than the ordinary carbon steels.

The theory of heat treatment rests upon the influence of the rate of cooling on certain molecular changes in structure occurring at different temperatures. These changes are of two classes, critical and progressive; the former taking place periodically between certain narrow temperature limits, while the latter proceed gradually with the rise in temperature, each change producing alterations in the physical characteristics. By controlling the rate of cooling, these changes can be given a permanent set, and the characteristics can thus be made different from those in the metal in its normal state.

The results obtained are influenced by certain factors, namely: The original chemical and physical properties of the metal; the composition of the gases and other substances which come in contact with the metal in the heating and cooling; the time in which the temperature is raised between certain degrees; the highest temperature attained; the length of time the metal is maintained at the highest temperature, and the time consumed in allowing the temperatures to fall to atmospheric.

The highest temperature to which it is safe to submit a steel for heat treating is governed by the chemical composition of the steel. The alloy steels must be handled very carefully in the process of annealing, hardening and tempering and for this reason special apparatus is utilized.

Condensation of Gas.

(1470)—In a recent issue of The Automobile Journal one of your writers stated that the form of the intake manifold was such that condensation of gas was eliminated, thereby making for easy starting. Why should one intake manifold make starting any harder than another, and what is condensation of the mixture?
REASON.
Dallas, Tex., Dec. 16.

Dealing with the first portion of the question, it may be stated that the design of the manifold is an important factor in carburetion. If it have numerous curves or bends, be of extreme length and the interior be rough, the mixture in flowing is apt to strike these places and become condensed. When the walls of a manifold are very rough and have pockets, the mixture will tend to turn to liquid, especially if the metal be cold.

Relative to the matter of starting: If the temperature be low and the passage of the mixture be impeded it will condense in a manner similar to steam striking a cold material. Consequently the air drawn into the combustion chamber of the cylinder will be minus the proper quantity of vapor and starting will be difficult because of the failure of proper combustion.

THREE BIG ENDURANCE RUNS.

Indiana Manufacturers and Chicago Motorists Completing Plans in Addition to Glidden Tour.

At least three big reliability tours are scheduled for next year, with the possibility of one or two others being added to the list. The Indiana Automobile Manufacturers' Association and the Hoosier Motor Club will promote an Indianapolis to San Francisco run to start July 4, to take the place of the annual four-states tour. The Glidden Tour from New Orleans to Detroit, or over another route which may be selected as a substitute later, will be run in June.

The third of the contests is one from Chicago to New York City. As yet, however, Buffalo has been selected as the terminus, but efforts are being made to have the Metropolis included in the itinerary. Definite plans will be completed soon by representatives from Chicago, Cleveland and Buffalo for a tour around the Great Lakes and other events of a similar nature are being considered.

The Inter Mountain Route Book Company has been organized at Salt Lake City, Utah, for the purpose of compiling a route book with logs and maps covering the states of Utah, Idaho, Nevada, Montana and Wyoming, which will be published under one head.

DOUBLE FEES IN BALTIMORE.

City Would Exact Another Set of Licenses in Addition to Those Imposed by State.

There is small wonder that the Automobile Club of Maryland is protesting vigorously against the enactment of the proposed ordinance in Baltimore requiring an additional set of license fees. Already the motorist must pay the state registration fee, $2 for an operator's license and personal taxes on his machine.

The state registration fees are: Less than 10 horsepower, $5; 10-20, $10; 20-30, $15; 30-40, $20; over 40, $25; business vehicles, $3; motorcycles, $1.80; manufacturers and dealers, $24. The proposed city ordinance demands the following fees in addition: Less than 20 horsepower, $5; 20-30, $15; 30-40, $20; 40-50, $25; over 50, $25 plus $1 a horsepower in excess of 50; taxicabs and other passenger vehicles for hire, carrying five persons or less, $15, and for more than five passengers, $3 a person.

DISCUSSING MOTORING LEGISLATION.

Automobile Clubs in Washington Combine to Present Needed Reforms.

Committees representing the automobile clubs in Seattle, Spokane, North Yakima and Tacoma, Wash., have been appointed to confer and draft bills to be presented to the legislature, asking for needed reforms in the present motoring law. The programme is an ambitious one, and includes the following:

Providing for at least one light on all vehicles other than automobiles; making the theft of a motor car of the same legal status as the theft of a horse; uniform regulations about turning to the right or left; stopping of traffic on crosswalks, preferably on the near crossing; forbidding the placing of advertising signs within 100 feet of a guidepost, so as to obscure the direction signs; providing a penalty for the removal of guideposts once they are placed, and prohibiting the throwing of rocks at passing automobiles, under severe penalties.

REPAIRING ROADS IN JERSEY.

Col. Stevens Evolves New Plan for the Distribution of Automobile Money.

In order to determine just what part of the money collected from automobile license fees shall be distributed to each of the counties in New Jersey, Col. Edwin A. Stevens, road commissioner, is having a set of books made so that each county must keep a complete cost of all repairs. Briefly, Col. Stevens' plan is set forth by him as follows:

> Before I will give a cent of automobile money for road repair I must have the estimated cost of the repair of such road. I will put this down in my record as 100 per cent. for the work, 10 per cent. for extras unforeseen, 6 per cent. for engineering and 4 per cent. for administration, thus adding 20 per cent. to the estimated cost for safety in apportioning the automobile money to the points where it will do the most good, as I am obliged under the law to do. In this way I shall have always before me a complete record of what is going on as to the finances of road repair, how much money I have left, and the applications for money from other roads.

WHAT IS A STREET CAR?

Massachusetts Supreme Court Says It Is a Vehicle—Boston Says It Is Not.

The recent decision of the Massachusetts supreme court in which it was determined by a vote of four to three that an electric street car is a vehicle within the meaning of the act of 1820, appears to set at naught the traffic regulations of

Digitized by Google

the street commissioners of Boston, in which street cars were expressly eliminated. In other cities and towns throughout the commonwealth there is a disposition to follow the practise that has been adopted for years, until such time as the forthcoming legislature shall have opportunity to amend the law of 1820.

Now that the automobile associations in that state are busy in the preparation of a bill covering this matter, consideration is being given to the proposition of establishing signals at all points where trolley roads cross the highway diagonally, as well as at right angles. It is maintained that the display of lighted lanterns at night and a wooden sign in the daytime would materially decrease the possibility of accident at such points.

In addition, the incoming legislature will be asked to take up the matter of readjusting the license fees, and the limitation of the load to be carried on motor trucks. These questions are by no means supported by organized motorists. In the former instance it is pointed out that over half a million dollars was contributed in automobile fees during the past year, and in the latter it is held that any attempt to curtail the usefulness of commercial cars would prove a decided hindrance to the advancement of modern transportation methods.

REGARDING AUTOMOBILE SIGNALS.

New Ordinance in Los Angeles Requires Something More Efficient Than Bulb Horn.

As a result of the efforts of the Automobile Club of Southern California and the police department of Los Angeles, Cal., a new ordinance has gone into effect in that city. The object sought is to reduce the number of accidents and to subdue the unnecessary noise element among motorists. Preliminary to the passage of the ordinance there was a test of automobile horns by traffic police. The result indicated that the ordinary bulb horn was inadequate to the demands of safety, in the opinion of these officials.

The new law consequently is directed against this type of signal device. It demands the use of a truly adequate warning signal, which is defined as "one producing an abrupt note sufficiently loud to be heard under all traffic conditions," but restricts its use to times when it is actually necessary as a warning of danger.

Connecticut motorists will introduce a universal lighting bill in the incoming legislature.

WATCHING CONVICTED CHAUFFEURS.

Secretary of State in New York Inaugurates New Policy Regarding Licenses.

Chauffeurs who have been convicted of any violation of the motor vehicle law in New York State are receiving from the secretary of state's office in Albany notice to the effect that they must make satisfactory statements as to their fitness before they receive licenses for the 1913 season. The letter reads as follows:

Before your application is sent you will be required to notify this bureau at Albany of the nature of the charge against you, the name of your present employer and how long you have been in his employ, with an affidavit from your employer stating that your services have been satisfactory.

If you are not employed at the time of the receipt of this letter then you will be required to forward to this office a sworn statement by some reputable citizen, giving his name and address, that you are morally qualified to act as a chauffeur and that in his opinion there is no reason why such a license should not be granted to you.

MILLIONS FOR GOOD ROADS.

New York Votes in Favor of Bond Issue and Governor Refuses Federal Money.

Every county in New York State voted in favor of the $50,000,000 bond issue for good roads, which was made a part of the ballot at the recent state election. While the exact figures have not been compiled, State Engineer Bensel reports that the majority in favor of the proposition is approximately 400,000.

In this connection it also is worthy of note that Gov. Dix has declined an offer of federal assitance in improving 50 miles of road in that state, over which mail is regularly carried. The United States government recently appropriated $500,000 to be distributed among the states by the postmaster-general and the secretary of agriculture, in improving roads for postal purposes, the government to furnish $1 for each $2 supplied by the state, $10,000 being set aside for New York. Gov. Dix's letter was as follows:

I beg to say that I am emphatically on record regarding the connection of the various links of improved highways in the state, and also feel that New York State, according to its population and the amount of taxes assumed by its citizens, should receive a larger proportion than 50 miles. For these reasons I cannot consistently recommend the designation.

An ordinance has been introduced in Pittsburg, Penn., compelling automobile drivers to signal with the arms when making turns or stopping in the city streets.
